MACRIN, SALMON, a Latin poet, who was born at London early in the sixteenth century. He was preceptor to Claudius of Savoy, count of Tende, and to Honorius, the count's brother; and wrote several poetical works in lyric verse, which were so much admired that he was called the Horace of his time. He died at London in 1555.—Charles Macrin, his son, was not inferior to him as a poet, and surpassed him in his knowledge of the Greek tongue. He was preceptor to Catherine of Navarre, the sister of Henry the Great, and perished in the massacre on St. Bartholomew's day in 1572.

MACROBIUS, AURELIUS AMBROSIIUS THEODOSIUS, a Latin author, who lived in the reign of the emperor Theodosius, to whom he officiated as an officer of the wardrobe, and enjoyed a considerable share of the imperial favour. The country of his birth, as well as the religion which he professed, are both uncertain. He was the author of a miscellaneous work, entitled "Saturnalia," curious for its criticisms, and valuable for the light it throws upon the manners and customs of antiquity; "A Commentary on Cicero's Somnium Scipionis," in two books, valuable for the exposition it affords of the doctrines of Pythagoras with respect to the harmony of the spheres; and a treatise "De Differentiis et Societatibus Græci Latinique Verbi." There are several editions of this author's writings, who is supposed to have died about the year 420.

MADAN, MARTIN, a celebrated Calvinistic minister, who was born in 1725. He was originally educated for the bar, but eventually quitted that profession for the church, and in 1761 was mainly instrumental in the erection of the chapel attached to the

Lock hospital. His principal work is entitled "The-lyphthora," in which he very powerfully advocated the prevention of seduction, by constituting it a virtual marriage. Mr. Madan died in 1790.

MADDEN, SAMUEL, an Irish clergyman, who was born in 1687. He was educated in Dublin, in which city he afterwards established a society of arts. He died in 1765, after a life of great public usefulness.

MADDOX, DR. ISAAC, a learned divine, who was born in the year 1696, and was educated at the university of Aberdeen; shortly after which he entered holy orders; and was made chaplain to Dr. Bradford, bishop of Chichester, whose niece he married. From this time his preferment was rapid; he was made king's chaplain, clerk of the closet to Queen Caroline, and, about the year 1736, bishop of St. Asaph; from whence, in 1743, he was translated to Worcester. He published several sermons, and "A Defence of the Doctrine and Discipline of the Church of England," in answer to Mr. Neale's "History of the Puritans." Dr. Maddox died in 1759.

MADISON, JAMES, an American bishop of the protestant episcopal church in Virginia. He was born August 27, 1749, near Port Republic, in the county of Rockingham. His father was for a long time clerk of the extensive district known as West Augusta, of which Rockingham county formed a part. At an early age the son was sent to an academy in Maryland, where he remained for several years, and received instruction in the classics. He then entered the college of William and Mary, where he was matriculated in 1768, and from which he obtained several honourable testimonials of his proficiency. One was the gold medal assigned by Lord Botetourt for the encouragement of classical learning, which was awarded to him in 1772. He studied law under Mr. Wythe, and was admitted to the bar; but he never relished the profession, so that, after one successful effort in an admiralty case, he abandoned it, and devoted himself to the church. In 1773 he was chosen professor of mathematics in William and Mary's college, and in 1777 was made president of that institution, being then but twenty-eight years of age. The statutes of the college required that the president should be thirty, but the rule was suspended in his favour. In the same year he visited England in order to qualify himself still more for the duties of his station. He continued in London until the latter part of 1778, and during his absence enjoyed the advantage of the aid and instruction of Cavallo in natural philosophy, and of other distinguished men in various branches of science. On his return home he took charge of the college, and commenced that long career of usefulness which entitles him to be considered as one of the greatest benefactors of Virginia. Throughout the whole revolutionary war he was unceasing in his exertions to sustain the college; and it was only for a short period during the struggle that its exercises were interrupted, viz., the autumn preceding and the winter and spring succeeding the siege of Yorktown. Until 1784 he was not only president, but professor of mathematics and natural philosophy. In that year he gave up the mathematical department, and became professor of natural and moral philosophy, of the laws of nature and nations, &c., and continued in this office until the period of his death.

In 1788 Mr. Madison was chosen bishop of the

protestant episcopal church, and in the following year again came to England for the purpose of consecration. Whilst here he formed an extensive acquaintance amongst the most distinguished literati, with many of whom he kept up an uninterrupted correspondence during the subsequent part of his life. At the end of eight months he returned to the United States. Various universities and literary societies subsequently conferred their honours on him. Under the care of Bishop Madison, the college of William and Mary advanced steadily in reputation, and became the *alma mater* of many eminent men. He was indefatigable in his lectures, and when in good health is known to have been engaged in the lecture-room from four to six hours every day throughout each week. He first introduced a course of systematic lectures on political economy into the college. In the department of natural philosophy he excelled, his enthusiasm there throwing a peculiar charm over his lectures. As a bishop, also, he was ardent in the performance of his duties, and his sermons caused him to be ranked among the first pulpit orators of that country. This excellent man died March 6, 1812, in his sixty-third year, after a painful illness of many months. His remains were deposited, by a vote of the faculty of William and Mary's college, in the chapel hall, and a marble monument was erected over them.

MADDOX, THOMAS, a learned English historian, who was born in the middle of the seventeenth century. He is only known by his literary labours, and his principal works are entitled "Anglicanum Formularium" and the "History of the Exchequer." About ninety volumes of his manuscripts were presented to the British Museum by his widow.

MÆCENAS, CILNIUS, a noble Roman, who was the favourite of Augustus, and patron of Virgil and Horace. He has been described as a pattern of every political virtue, and a generous patron of the sciences. He was never, in fact, however, a public minister; for even the office of prefect of Italy and Rome, which he held after the victory at Actium, was only a private trust; and the opinions which are entertained of him as the protector of the learned, and which have made his name proverbial, seem to be very much exaggerated. It is true that he collected at his table poets, wits, and learned men of every description, if they were pleasant companions, sought their conversation, and sometimes recommended them to Augustus; but it was from political motives, for the purpose of gaining friends for Augustus, and extending his fame. It is true, also, that he gave Horace a farm, and obtained his pardon and freedom, and that he enabled Virgil to recover his property; but, for a man whom Augustus had made exorbitantly rich, the present to Horace was a trifle, and Virgil merely received from him what was justly his own.

Mæcenas was not a man of great qualities, but he well understood how to employ the favours of fortune. Without strong passions and a lofty ambition; endowed with a fine taste and a sound judgment; prudent, and cool enough to do whatever he did rightly and thoroughly, and sanguine enough not to shrink before difficulties, and always to anticipate a happy result, but too fond of ease and pleasure to love or to pursue any business, if he was not compelled by necessity; of an agreeable person, gay in conversation, affable and generous; inclined to rally

others, and equally willing to receive their attacks in return; artful and skilful in employing others for his own purposes; careful in the choice of his intimate friends, but faithful and constant after he had once chosen them; and, if necessity required, capable of any sacrifice. These qualities gained him the confidence of Augustus, which he enjoyed undiminished till his death. Augustus used to banter him on his effeminacy, his love for precious stones and gems, his affectation in mixing old Etrurian words with Latin, and making new words. In return, Mæcenas ventured to make use of great freedom, or rather of severity of expression, as, for instance, during the triumvirate, when Octavius was in the tribunal, passing many sentences of death, Mæcenas presented him his tablets with the words, "Surge tandem, carnifex!" (rise, executioner!)—a reprimand which produced its effect; and Octavius did not take offence at it. When Augustus consulted with Agrippa and Mæcenas, whether to retain or resign the supreme power, Mæcenas, in opposition to the advice of Agrippa, urged him to retain it. Thus he proved that he preferred the profitable to the honourable. Mæcenas appears less worthy of esteem as a private man. He had a palace in the form of a tower, on the Esquiline hill, which was surrounded with splendid gardens. Here, at the close of the civil wars, he resigned himself to indolence, luxury, and frivolous pleasures. Of all spectacles he was most fond of the pantomimic dance, which he himself introduced into Rome. Bathyllus, who was celebrated for his beauty, and his skill in this exhibition, was his favourite. He was no less fond of the pleasures of the palate. His indolence betrayed itself in his dress, in his gait, in his manners, and even in his style. His writings are mentioned by Seneca, Isidorus and others; but none of them are extant.

MÆSTLIN, MICHAEL, a celebrated German astronomer of Germany, who was born in the duchy of Wirtemberg, but spent his youth in Italy. He afterwards returned to Germany, and became professor of mathematics at Tübingen; where, among his other scholars, he taught the great Kepler, who has praised several of his inventions, in his "*Astronomia Optica*." Though Tycho Brahe did not assent to Mæstlin's opinions, yet he allowed him to be an extraordinary person deeply skilled in the science of astronomy. Mæstlin published several mathematical and astronomical works, and died in 1590.

MAFFEI, a celebrated Veronese family, which has produced many eminent men. Among them we may enumerate Alessandro Maffei (marquis), who was born in 1662, served under Maximilian Emanuel, in the campaigns against the Turks and the French, distinguished himself in the war of the Spanish succession, and, after the victory of Belgrade, was made field-marshal, and died at Munich in 1730. The memoirs which appeared under his name were written by his brother.

Bernardino Maffei was born at Rome in 1514, educated at Padua, created cardinal at the age of thirty-five, and died at the age of forty. He possessed a large collection of coins, of which he made use in his lost "*History from Medals*."

Francesco Scipio Maffei was born at Verona in 1675, and studied in the Jesuits' college at Parma. He went to Rome in 1698, where he devoted himself to poetry, and was received into the Arcadia. He afterwards entered the military career, served under his brother Alexander in the Spanish succession war, and in 1704

was present at the battle of Donauwörth as a volunteer. His literary taste soon recalled him to Italy, where he wrote his "*Della Scienza chiamata Cavalleresca*," a work full of learned research into the usages of the ancients in settling private quarrels, and in which he maintains that duelling is contrary to religion, sound reason, and the welfare of society. To improve the condition of Italian literature, the decline of which he lamented, he undertook, in connexion with Apostolo Zeno and Vallisnieri, the publication of a periodical, the object of which was to criticise native works, and make his countrymen acquainted with foreign literature. At the same time he directed his attention to the Italian drama, which he enriched by his "*Teatro Italiano*," a collection of the best comedies and tragedies, and by his original tragedy of "*Merope*." This production, although only a judicious essay towards uniting the Greek and French tragedy, met with the most brilliant success. His comedy "*La Ceremonia*" was also brought upon the stage with applause. To revive the study of the Greek language, which was much neglected by his countrymen, he invited skilful teachers to Verona, whom he supported at his own expense. The discovery of some important manuscripts in the cathedral of his native city gave his learned labours a new turn, one of the results of which was "*Verona Illustrata*." Maffei's reputation had now extended to foreign countries, and in 1732 he set out on a visit to France, England, Holland, and returned by the way of Vienna, where he was received in the most flattering manner by Charles VI. He died in Verona in 1755, and a monument is there erected to his memory. Among his numerous works, the most important, besides those already mentioned, are, "*Rime e Prose*;" "*Istoria Diplomatica*;" "*Museum Veronense*," and other writings relative to his native city.

Giovanni Pietro Maffei, one of the most learned writers among the Jesuits, was born at Bergamo, in 1535, went to Rome, where he became acquainted with Annibal Caro and other distinguished men, became afterwards professor of rhetoric at Genoa, then secretary of the republic, and, two years later, entered the order of the Jesuits in Rome. Having published a Latin translation of Acosta's "*History of India*," he was invited by Henry of Portugal to Lisbon, and employed to write a general history of India; for which purpose he had access to original documents in the archives. This work appeared at Florence in 1588, and is characterized rather by beauty of style than by profoundness of research or acuteness of judgment. He died at Tivoli in 1603.

Paolo Alessandro Maffei was born at Volterra in 1653, and died in Rome, where he had chiefly resided, in 1716. By an industrious study of museums and cabinets, he acquired an extensive knowledge of ancient works of art. His principal works are, "*Raccolta di Statue Antiche e Moderne*," and an edition of Agostini's "*Gemme Antiche*," which he enriched with valuable notes and additions; it is less prized by connoisseurs than the old and scarce edition of 1657, which is remarkable for the beauty of its engravings.

Raphael Maffei, called also Raphael of Volterra, was born at Volterra in the middle of the fifteenth century, and died there in 1522. His chief work is "*Commentarii Rerum Urbanarum Libri*," of which the first twenty-three books contain geographical and biographical treatises: the remainder is a general view of the state of knowledge at that time.

MAGEE, WILLIAM, a distinguished Irish eccle-

siastic, who was born in 1765, and educated at Trinity college, Dublin. He was for some time assistant professor of oriental tongues, and about 1806 became professor of mathematics. Minutely acquainted with every branch of that abstruse science, he selected for the use of the candidates for fellowships a course both concise and elementary, observing, that, on account of the extent and diversity of their studies, relative merit could not otherwise be ascertained during the limited period allotted to a *visd voce* examination. The fellowship was usually decided during the two hours that he acted as examiner: since his time the course has been much, and for other purposes usefully, extended; but mathematics have ceased to be decisive as a test for determining a fellowship.

It was, however, to his services in the cause of religion that Dr. Magee was indebted for his promotion. His celebrated "Discourses on the Scriptural Doctrines of the Atonement and Sacrifice" were first published in 1801. The work consists of two sermons, with notes; and it obtained a degree of popularity on its first publication, which has never been exceeded by any theological production of modern times. Its object was to arrest the further spread of unitarian principles, and particularly to expose that qualification of the opinions of Arius, by which Socinus and his modern followers have endeavoured to conciliate the conscience and judgment of honest minds. The style is peculiarly striking, and the notes are somewhat in the style of "The Pursuits of Literature." They are lively, terse, and elegant, at once appealing to the imagination and the understanding.

In consequence of the great reputation which followed the publication of this book, Dr. Magee was advanced in 1813 to the deanery of Cork. In 1819 he was consecrated bishop of Raphoe, and in 1822 was translated to the see of Dublin, by the late Lord Liverpool. Dr. Magee's other publications consist of "A Thanksgiving Sermon on the Delivery of this Kingdom from Invasion," 1797; "A Sermon occasioned by the Death of the Earl of Clare," 1802; and "A Memoir of Thomas Percival, M. D." Dr. Magee died August 18th, 1831.

MAGELLAN, FERNANDO DE, a celebrated Portuguese navigator, who discovered the straits at the extremity of South America, and conducted the first expedition round the world. He served under Albuquerque in the East Indies, and distinguished himself especially at the taking of Malacca in 1510. He afterwards entered into the service of Spain, and was entrusted by Charles V., with the command of a fleet destined to explore a passage to the Molucca islands by sailing westward. The voyage was commenced in September 1519. About the end of October 1520 he entered the straits since called after his name, and on the 27th of November discovered the Pacific ocean. Continuing his course, he arrived at the Ladrone islands, and subsequently at the Philippines, on one of which he lost his life in a skirmish with the natives in 1521.

MAGLIABECCHI, ANTONIO, a learned critic, who was librarian to the duke of Tuscany, and celebrated alike for the variety of his knowledge and the strength of his memory. He was born at Florence in 1633, and in the early part of his life was engaged in the employment of a goldsmith, which he relinquished to devote himself to literary pursuits. He was assisted in his studies by Michael Ermini, libra-

rian to Cardinal Leopold de' Medici, and other literati residing at Florence. Through unremitting application, he acquired a multifarious stock of erudition, which made him the wonder of his age. Duke Cosmo III. made Magliabecchi keeper of the library which he had collected, and gave him free access to the Laurentian library, and the Oriental MSS.; of the latter collection he published a catalogue. His attention was wholly absorbed by his books; among which he took his rest and his meals, dividing his time between the ducal library and his private collection, interrupted only by the visits of persons of rank or learning, attracted towards him by the report of his extraordinary endowments.

MAGNIEZ, NICOLAS, a learned ecclesiastic, who died in the year 1749 at an advanced age. He is best known by his excellent Latin dictionary, entitled "Novitius," which was published at Paris in 1721. In his dictionary, besides the words to be met with in the classics, we find many of those which occur in the Bible, and the ecclesiastical authors, the terms of art, the names of great men, heathen gods, bishops, &c.; in short, many more words than are usually to be found in the ordinary dictionaries.

MAHMOUD was the first sultan of the Gaznevide dynasty. He was the son of the governor of Chorasan, and sovereign of Gazna. He was sixteen years old when his father died in 997. He drove the king of Turkestan from Chorasan, invaded Hindoostan, and captured Gebal, a powerful prince. In 1002 he reduced Khalif, the revolted governor of Segestan, and repeating his invasion of India, returned and overcame Ilekk Khan, who had invaded Chorasani. He defeated him a second time, though Ilekk had been joined by Kader Khan, with 50,000 horse. He now extended his conquests far and wide, and acquired immense treasures. In 1029 he conquered Persian Irak. He died in 1030, after a prosperous reign of thirty-one years. He is extolled by the Mohammedan writers for his regard to justice, and his zeal for the propagation of his religion, which he spread in India by the extermination of a vast number of idolaters, and the demolition of their temples.

MAHMOUD II., khan and padishah, the twenty-ninth sovereign of the family of Osman, the twenty-sixth grand sultan, and twenty-first caliph, "the shadow of Allah upon earth;" an absolute prince, who, possessing by nature the disposition of a despot, has been obliged for a great part of his reign to contend against rebellions in the provinces, and the insubordination of the janizaries. He is the second son of Abd-ul-Hamid, who died in 1789, and was born in July 1785. Mustapha IV., the elder brother of Mahmoud, who ascended the throne in 1807, had already, according to ancient custom, ordered him to be put to death, that he might have no competitor to fear, when Ramir Effendi, paymaster of the army, at the head of 2000 Albanians, rescued the prince. The valiant Bairaktar, pacha of Ruschuk, immediately deposed Mustapha IV., and girded Mahmoud with the sword of Osman, on the 28th of July, 1808. Fourteen weeks afterwards the janizaries, offended by the military reforms made by the grand vizier Bairaktar, took the seraglio by storm, and Bairaktar immediately ordered the execution of Mustapha and his mother, and then blew himself up with his enemies. The battle between the Seymens (infantry on the European system, in favour of whom the sultan Mahmoud had declared himself) and the janizaries

was continued thirty-six hours longer in the seraglio and the capital, amidst pillage and conflagrations. The rebels gained the victory, and, for the preservation of his life, Mahmoud was compelled to send deputies to them, and to submit unconditionally to their demands. After these horrors, Mahmoud was not able to execute any plan of reform in the army, although he still persevered in his intention. At every attempt the janizaries obtained by force the discharge and execution of the commanders and ministers who undertook to establish order and discipline. Mahmoud thought only of securing himself upon the throne, stained with the blood of his uncle Selim and of his brother Mustapha. He therefore, according to Pouqueville, murdered the son of Mustapha IV., an infant three months old, and thus he remained the last and only descendant of the family of the prophet. His will was now made known by the severest orders. Without advisers, without resources, and almost without an army, he continued the war with Russia, and against the Servians. At length, when he was totally exhausted, his divan concluded a treaty at Bucharest with Russia, in May 1812. This measure was advised by England, but disappointed the expectations of Napoleon, who, in connexion with Austria and Prussia, had pronounced the integrity of the Porte. Having been educated in the seraglio, where the validé or sultana mother, according to ancient custom, never calls her son otherwise than, my lion, my tiger! the grand seignior knows no law, but some forms of custom, and has no regard for any constraints but those of necessity. The circumstances of horror under which he ascended the throne, and the dangers which perpetually surrounded it, hardened his heart and blinded his judgment.

As every sultan is directed to learn some art, he chose calligraphy. Vain of his skill, Mahmoud resolved to write with his own hand all the *kiat-she-riffs*, or orders, in his own name, and to keep a journal of his thoughts. His papers soon accumulated to such a degree upon his sofa, that he looked around for a private keeper of the archives. He found a suitable person for this office in his barber, who was doubly worthy of his confidence, because he could neither read nor write. Khalet Effendi, a courtier, who amused and ruled the sultan by his buffoonery, also occupied a high place in his favour. Barber Baschi introduced this Khalet to Mahmoud; he had once been his companion in the coffee-houses of Galata, a clerk of the corporation of butchers in Constantinople. He was afterwards, in 1806, the ambassador of Selim III. to the court of Napoleon. These men were the centre of all the intrigues which spread from the seraglio to the provinces. Khalet soon amassed great wealth by means of presents, and his influence became so important that he completely governed the sultan and the submissive divan; but he was unable to persuade the mufti to admit him among the ulemas. This privileged caste scorned to receive the universal favourite, because he was the son of a man who sold livers, and, moreover, a child of the world who drank wine. Khalet punished the mufti with banishment. The new mufti, therefore, and Ali, the new grand vizier, were eager to employ every means to conciliate the favour of Barber Baschi and Khalet Effendi. The latter, however, avoided receiving any important office, lest he should be held responsible for the ill success of any measure which

he advised. But he divided the spoil with the governors, who plundered the provinces, and who bribed the principal members of the divan, and was careful that no complaint should reach the ears of the sultan. Pouqueville maintains that the grand seignior himself shared with his favourite the sums extorted from the rich. Mahmoud exhibited, however, a proud and inflexible disposition towards Christian princes. The speedy execution of justice in the capital, united with the severe police, over which Mahmoud, who not unfrequently walked about incognito, kept watch, shows that he was not deficient in energy or talents. But the great and the powerful always remained the slaves of his humour, his avarice, and his suspicion. No high officer, whether guilty or innocent, was secure of his property or his life; hence the universal disposition for a revolution, and the intriguing policy of the divan, to make the satraps instruments of their mutual destruction, and thus to obtain the treasures of both parties.

The reign of Mahmoud has therefore been a continued scene of treasons and rebellions. The Servians succeeded in shaking off the yoke of the pacha of Belgrade; Mohammed Ali Pacha, conqueror of the Mameluke beys and of the Wechabites, became almost absolute sovereign of Egypt; by means of bloody insurrections, Rumelia, Widdin, Damascus, Trebisond, St. Jean d'Acre, Aleppo, Bagdad, Lattakia, and other pachalics, changed their masters; the bold and crafty Ali in Janina raised himself to the throne of Epirus. To make himself master of the treasures of this pacha, Mahmoud, by the advice of Khalet Effendi, accused him of high treason. This policy involved the Porte in a civil war, which betrayed its weakness, drove the Greeks to despair, and brought on their revolution. A foreign embassy informed the Porte of the plans of the Greeks, and Khalet Effendi resolved to extirpate them. In the name of Mahmoud he gave the following commission to the *seraskier* Ismaël and Khurschid Pacha:—"Every Christian capable of bearing arms must die; the boys shall be circumcised and educated in the military discipline of Europe; not to offend the ulemas, they shall be styled janizaries." All the decrees which roused the fanaticism of the Mussulmans in the capital and in the provinces, the equipment of the faithful for war, favourable prophecies in the name of the prophet, the proscriptions and executions of the rich, the profanation of Christian churches, &c.,—all these, Pouqueville says, proceeded from the seraglio, and were the work of Khalet. Cruelty and avarice led the sultan and his favourite to these measures of terror, while, by letters extorted from the patriarch, and promises of amnesty made only to be violated, they strove to persuade the Greeks to lay down their arms. The grand seignior himself was present when the innocent Prince Constantine Morousi was beheaded. He beheld from a kiosk of the seraglio the bodies of the patriarch Gregory and of the murdered members of the Grecian synod, dragged by Jews, and thrown into the sea; and witnessed the execution of the princes Mavrocordato and Chantzerys, with a multitude of rich merchants and bankers of the Porte.

When Mahmoud had, at last, succeeded in destroying his enemies in the capital and in the two principalities where the rebellion originated, while the disaffected governors in the provinces had been subdued by ambitious pachas, and the head of the formidable

Ali lay at his feet,—when he had happily concluded the war with Persia by the peace of 1823, brought about by the mediation of England, and had no more to fear from the Wechabites,—then it was, after so many perils, that, intoxicated with apparent success, he every day grew more cruel and more intolerable. The children and grand-children of Ali, who had surrendered themselves on the faith of the sultan, were put to death. Inflexible in that design of extermination which he had conceived against the Greeks, he submitted to the powers of Europe in only a few particulars relating to the restoration of the churches and of the advantages of trade; and, after the intercession of the ambassadors of England for three years, he consented to the evacuation of Moldavia and Walachia in June 1824. When the diplomatic corps in Pera protested against the execution of the prelates, he answered—“The sultan is an absolute, independent sovereign, accountable for his actions to no man.” His divan, likewise, refused to send a plenipotentiary to the congress of Verona. But Mahmoud trembled whenever the rage of the janizaries, whose severe generals tried in vain to bridle them, wasted the capital with fire and sword; he sacrificed every thing to calm their fury—the most able men in the state and in the army, his nearest relatives, his most tried friends, and even Khalet Effendi, whose services were indispensable to him. In this favourite the janizaries saw the author of the fatal Greek revolution, and of those oppressive exactions which were intended to supply the extravagance of the seraglio.

They commenced their attacks upon him by posting up pasquinades on his character; scurrilous songs were sung in the watch-houses respecting Khalet Effendi and Khasnadar Usta, the favourite slave of the sultan, who, it was said, cost him more than it would to support a whole army. In vain did Khalet endeavour to escape the storm himself, by executing the generals, whom he charged with the misfortunes in Greece, or rich Greeks, whom he accused of being traitors; in vain did he lavish gold with an unsparring hand on the rebels: the highest men of the empire themselves prepared his destruction, because he enjoyed alone the confidence of the grand seignior. He and his creatures, the grand vizier, Salik Pacha, and the mufti, were accused of wishing to dissolve the janizaries, and substitute disciplined troops in their stead. A rebellion finally broke out in November 1822, and the sultan banished the grand vizier, the mufti, Berber Baschi and Khalet Effendi; a vast number of officers were executed or dismissed. Khasnadar Usta, the favourite slave, was committed to the chief of the eunuchs for correction, and shut up in the prison of the harem with several Odalisks. Khalet retained his property and retired to Iconium, the place of his exile, with a princely retinue. But his enemies soon succeeded in persuading the sultan to gratify his own avarice, and confiscate the wealth of his favourite. This measure was immediately followed by a firman dooming Khalet to death. He was executed by the aga of the janizaries, though he considered his safety secured by a firman under the hand of the sultan, and his friends and creatures suffered the same fate.

Mahmoud complied with every wish of the janizaries, which was made to him by their representatives in the divan. When peace seemed to be again restored, when Scio was destroyed and the war with

Persia brought to a close, he resolved to punish the insolence of his soldiery. The grand vizier Abdullah, a friend of the janizaries, and the aga of the janizaries, both enemies of Khalet, were deposed and put to death. Great preparations for the fourth campaign against the Greeks in 1824; the prospect of a speedy reconciliation with Russia, which announced to the divan the mission of the marquis de Ribeaupierre as its minister to Constantinople; the aid afforded by the viceroy of Egypt against Candia and Morea; the arrival of the French ambassador, General Guilleminot; the friendly connexion of the Porte with Austria and England; the fall of Ipsara in July 1824;—in fine, every thing conspired to fill the sultan with the proudest expectations. But when the severities of his son-in-law and favourite, Hussein, aga pacha of the janizaries, and the measures of the grand vizier Ghalib, renewed the old spirit of sedition; and when news arrived from Thessaly, where the seraskier, Dervish Pacha, was defeated by the Greeks in June 1824, and from Epirus, where Omer Vrione had effected nothing for the Porte; when the Greek fleet appeared before Ipsara and the Dardanelles, and the expedition of the capudan pacha against Samos failed,—then the rage of the janizaries in Constantinople burst forth with redoubled violence.

Their hatred against Mahmoud was vented in the boldest threats, and he was accused of having represented his eldest son Abd-ul-Hamid, who was born in March 1813, as subject to epilepsy, and of having under this pretence withdrawn him from view that he might poison him with impunity if the insurgents should seek to place him upon the Ottoman throne. To avoid massacres and conflagrations, and to save himself, Mahmoud deposed Hussein Pacha and the aga of the arsenal in August 1824, banished them from the country, and led the prince with him into the mosque. In the following September he was obliged to appoint the pacha of Silistria, a friend to the janizaries, to succeed Ghalib as grand vizier. As the dangers thickened around him, Mahmoud grew more firm. He was gradually maturing the plan of a total reformation. He commenced with severe measures; for in August 1825 he went so far as to forbid the Bible of the Christians to be distributed in his empire. Greater activity and important improvements in the arsenal and in the marine at last gave the Ottoman fleet a kind of superiority over the Grecian. The new seraskier Redschid Pacha, and the new capudan pacha Khosrew, were more fortunate than their predecessors. From the viceroy of Egypt the divan received the most important aid in the Morea; but they delayed from month to month the redress of the complaints of Russia. At length, when the emperor Nicholas resolved to bring the affair to a speedy termination, Mahmoud was forced to accept the *ultimatum* of April 1826, which was delivered to him by Minziaky. The Turkish troops now evacuated Moldavia and Walachia. The question between Russia and Turkey was finally settled by the treaty of Ackerman in October 1826, and Mahmoud granted to Russia all her demands. The treaty here agreed upon, however, was not carried into effect until May 1829, after which the Russian minister, M. de Ribeaupierre, had an audience with the grand vizier and the grand sultan. Mahmoud was made compliant principally by the dangerous reform which he had commenced in his troops. He had long resolved to dissolve the janizaries, and the burning of the village of Galata

by them decided him to put his plans into immediate execution. With this object, he issued a hattissheriff on the discipline of the janizaries and the reorganization of the army. In consequence of this, a general rebellion of the janizaries in Constantinople took place, but the sultan unrolled the banner of the prophet, and after a bloody contest, repulsed the insurgents. A fetva of the mufti, seconded by a firman of the sultan, now declared the janizaries dissolved. On this occasion the grand seignior distinguished himself as well for his courage as for his firmness. For many days and nights he encamped with his ministers and generals on the Atmeidan. He used every effort for the formation of an army on the European system, and ultimately succeeded in one of the most perilous reforms ever undertaken.

MAHOMET.—See MOHAMMED.

MAILLA, JOSEPH-ANNE-MARIE DE MOYRIAC DE, a learned Jesuit, who was born in the castle of Maillac in the Bugey, and appointed a missionary to China, whither he went in 1703. At the age of twenty-eight he had acquired so much skill in the sciences, mythology, and ancient books of the Chinese, as to be employed by the emperor Kham-Hi to draw a chart of China and Chinese Tartary, which was engraved in France in 1732. He also drew particular charts of some of the provinces of the empire, with which the emperor was so pleased that he settled Mailla at his court. The great annals of China were also translated into French by Father Mailla, and his manuscript was transmitted to France in 1737. This work was published in twelve volumes quarto. Mailla, after having resided forty-five years in China, died at Peking on the 28th of June, 1748, in the seventy-ninth year of his age.

MAILLET, BENOIT DE.—The descendant of a noble family in Lorraine, who was born in 1669, and appointed at the age of thirty-three consul-general of Egypt. He fulfilled this office for several years with great ability, supporting the king's authority against the janizaries, and extended the trade of France into that part of Africa. As a recompence for his services, the king bestowed upon him the consulship of Leghorn. In 1715 he was appointed to visit the sea-ports in the Levant and on the coast of Barbary. He was so successful in the execution of his commission that he obtained permission to retire with a considerable pension. He settled at Marseilles; where he died in 1738 in the seventy-ninth year of his age. He was a man of a lively imagination and gentle manners; in society he was very amiable, and he possessed the strictest probity. During the whole of his life he paid particular attention to the study of history, and his principal object was to become acquainted with the origin of our globe. On this important subject he left some curious observations, which have been published in octavo under the title of "Tellimaed," which is the name De Maillet written backwards. The editor, Abbé Mascrier, has given this work the form of a dialogue. An Indian philosopher is introduced as explaining to a French missionary his opinion respecting the nature of the globe and the origin of mankind, which he supposes to have come out of the waters, and makes an abode uninhabitable by man the birth-place of the human race. His great object is to prove that all the strata of which this globe is composed, even to the tops of the highest mountains, have come from the bosom of the waters; that they are the work of the sea,

which continually retires to allow them gradually to appear. Tellimaed dedicated his book to Cyrano de Bergerac, author of the imaginary "Travels to the Sun and Moon." Of the six dialogues which compose the work, the four first contain many curious observations; in the other two we find nothing but conjectures, fancies, and fables, sometimes amusing, but always absurd. To De Maillet we are indebted also for "A Description of Egypt," collected from his memoirs by the editor of "Tellimaed," 1743.

MAIMBOURG, LOUIS, a celebrated French ecclesiastical historian, who was born at Nancy in 1620, and entered into the society of Jesuits at sixteen years of age, and when he had finished the usual course of study, became classical teacher for six years. Having written a treatise in defence of the rights of the Gallican church against the pretensions of the see of Rome, he was expelled from the society of Jesus in 1682, by order of Pope Innocent XI.; for which disgrace he was compensated by a pension from Louis XIV. He died in 1686. As an historian, he is partial and inexact. His complete historical works contain histories of the crusades; of the league; of the decline of the empire after Charlemagne; of the pontificates of St. Gregory and St. Leo; of the schism of the Greeks; of the grand schism in the east; of Arianism; of the Iconoclasts; of Lutheranism, and of Calvinism.

MAIMON, MOSES BEN, or MAIMONIDES, a distinguished Jewish scholar, who was born at Cordova in Spain, in 1139. With the lessons of the Arabian Thophail and Averroës in medicine and philosophy, he united the study of the ancient philosophers, particularly of Aristotle, and thus rendered himself an object of suspicion to his Jewish brethren. To escape their persecutions he went to Egypt, and became physician to the sultan Saladin, under whose protection he established a celebrated seminary in Alexandria. The intrigues of his enemies soon obliged him to leave that city, and the remainder of his life, which he closed in Cairo or in Palestine in 1205, was passed in continual wanderings. Among his writings, the most celebrated is his "Moreh Nevochim, or the Teacher of the Perplexed," an attempt to reconcile the doctrines of the Old Testament with reason, or a sort of religious philosophy, which bears strong testimony to his acuteness and clear understanding. It was written originally in Arabic, and translated by some Jews into Hebrew, and by Buxtorf into Latin. Among his other works, his excellent "Commentary on the Mishna," in Hebrew and Latin; his "Jad Chazakha," an abridgment of the Talmud; his "Sepher Hammisoth, or Book of Precepts," Hebrew and Latin; an exposition of 613 affirmative and negative precepts of the law; deserve mention. He was also author of a book on idolatry, translated by Vossius; one on Christ, translated by Genebrard; several medical and other works, letters and essays. The Jews call him the doctor, the great eagle, the glory of the west, the light of the east, and consider him inferior only to Moses. They often designate him, according to their usual custom, by the four letters R. M. B. M., Rabbi Moses Ben Maimon.

MAIMON, SOLOMON, a distinguished Jewish philosopher, who was born in Lithuania in 1753. After having lived in extreme poverty, his thirst for knowledge carried him to Germany, where he became known to Mendelssohn in Berlin, and obtained as-

assistance from him. He pursued his studies, particularly in philosophy, with great zeal, turned his attention for some time to pharmacy, travelled to Hamburg, Amsterdam, Breslau, returned to Berlin, and died in Silesia in 1800. He wrote memoirs of his own life. He was the author of "Essays on the Transcendental Philosophy;" "Essay toward a New Logic, with Letters to *Ænesidemus*," in which he attempts to correct and define more accurately Kant's transcendental logic; a work on "The Categories of Aristotle;" and "Critical Inquiries into the Human Mind."

**MAINTENON, FRANCOIS D'AUBIGNE, MARCHIONESS OF.**—This talented French lady was descended from a noble protestant family. She was born in 1635, in the prison of Niort, where her father was confined. In 1639 M. d'Aubigné, having been released, set sail for Martinique with his daughter. After his death in 1645, his widow returned to France totally destitute, and the young Frances was taken into the house of her aunt, a Calvinist, whose creed she soon after adopted. Every means was used by her mother to reclaim her, and she finally yielded to harsh treatment, and, after a long resistance, abjured that creed. The death of her mother left her solitary and dependent, and although she was received into the house of Madame de Neuillant, her godmother, she was subjected to all kinds of humiliations, and considered herself happy in becoming the wife of the deformed, infirm, and impotent Scarron, who, touched with her situation, offered to pay the sum necessary to enable her to enter a convent or to marry her. Scarron was not rich, but his family was respectable, and his house was frequented by the most distinguished society of the court and the city. His wife conciliated general esteem and affection by her social qualities, her talents, and her modesty.

On his death, in 1660, his widow, who was again left destitute, was on the point of embarking for Portugal as a governess, when Madame de Montespan, the mistress of Louis XIV., procured her a pension, and afterwards had her appointed governess to the duke of Maine and the count of Toulouse, her sons by Louis. In this post she became better known to the king, who was at first prejudiced against her, but who learned to esteem her for her good sense, and the care which she bestowed on the education of the duke of Maine. He made her a present of 100,000 livres, with which, in 1679, she purchased the estate of Maintenon, and becoming fond of her society, gradually passed from intimacy to love. Madame de Montespan herself contributed much to the elevation of De Maintenon by her capricious and arrogant temper, and while the latter withdrew the king from his connexion with the former, she supplanted her in his affections. Louis XIV. was then at an age when men wish for a wife in whom they may confide their joys and sorrows, and he longed to alleviate the weight of government by the innocent pleasures of domestic life. The yielding temper of Madame de Maintenon, who from youth up had learned to accommodate herself to the wishes of others, promised him an agreeable companion and a trusty friend. Besides this, she had a leaning towards devotion, and the king had himself manifested a similar inclination as years came on. Père Lachaise, his father confessor, advised him to sanction his wishes by a secret but formal marriage, which was solemnized in 1685. The

archbishop of Paris, Harley, married them in presence of the confessor and two witnesses. Louis was then forty-eight, Madame de Maintenon fifty years of age. At court the marriage always appeared doubtful, although a thousand indications betrayed it. Yet the happiness of M. de Maintenon was not lasting: she herself says, "I was born ambitious: I resisted this inclination. When the wish, which I no longer indulged, was fulfilled, I thought myself happy; but this intoxication lasted only three weeks." After her elevation, she lived in a sort of retirement from the world. Louis XIV. visited her several times a day, and transacted business with his ministers in her apartments, while she read or otherwise employed herself. Although in appearance she neither knew nor wished to know any thing of state affairs, yet she often had a decisive influence on them. Chamillart was made minister, and Marsin commander of the army in Germany, and Vendôme and Catinat were dismissed by her influence.

The nation accused her of errors, and the excuse of good intentions could not always exculpate her. In all other respects entirely submissive to the will of the king, she was wholly occupied with the means of rendering herself agreeable to him, and this slavery of her age made her more unhappy than the poverty of her youth. "What a martyrdom," said she to Lady Bolingbroke, her niece, "to be obliged to amuse a man who is incapable of being amused!" The king, who sometimes teased her with his ill-humour, endeavoured to atone for this by proofs of esteem, such as he had never shown to any other woman. But these external forms could not console her chagrin. She did nothing for her family because she feared to attract the notice of the nation; she would receive nothing herself but the estate of Maintenon and chateau, of which a view is given in the accompanying engraving, and a pension of 48,000 livres.

Among her benevolent plans, was the foundation of the school at St. Cyr, for the education of poor girls of good family. Thither she retired after the death of the king in 1715, taking part in the instruction and amusements of the pupils till her own death in 1719.

**MAIO, ANGELO**, a Jesuit, who in 1813 was made superintendent of the Ambrosian library at Milan. In 1819 he was made keeper of the library of the Vatican in Rome, afterwards librarian, and in 1825

supernumerary apostolic prothonotary. He rendered important services to literature by the discovery of several ancient works in Greek and Latin in the *Palimpsests*, as they are called, or *Codices Rescripti*, which he rendered legible by chemical means. In 1814 he gave to the world the fragments of three unpublished orations of Cicero, which he discovered in a codex; and in 1815 a number of hitherto unknown orations of Cornelius Fronto, with some letters of the emperors Marcus Aurelius and Lucius Verus, and other fragments of ancient authors. In the same year he published considerable fragments of eight orations by Symmachus. He also discovered about sixty verses of the *Vitularia* of Plautus, never before printed, and designs illustrative of the comedies of Terence, with an old commentary, the complete oration of Isæus on the inheritance of Cleonymus, and an oration of the philosopher Themistius. In 1816 he discovered some books of "The Roman Antiquities of Dionysius of Halicarnassus," before unknown, containing that portion of the Roman history which was lost in the books of Livy. In the same library he found fragments of the Mæso-gothic translation of the epistles of Paul, and a manuscript account of the campaigns of Alexander, written by an unknown author in the reign of the emperor Constantius, son of Constantine the Great.

MAISON, NICHOLAS JOSEPH, peer of France, who was born in 1770, and commenced his military career at the beginning of the revolution; and after having served during several campaigns as an infantry officer, became aide-de-camp to Marshal Bernadotte. In the campaign of 1807 he acquired great praise for his conduct in an attack on the Prussians. He was sent into Spain in the following year, drove the enemy at Pinosa from a post which was believed to be inaccessible, and subsequently made himself master of one of the suburbs of Madrid. He served in Russia and Germany in 1812 and 1813, took so conspicuous a part in the actions of Polotsk and Tol-towa, that he was made general of division on the field of battle, routed the Prussians at the bridge of Willig, was wounded at the battle of Wachau, and received from Napoleon the cross of the order of union and the title of count. In 1814 he was entrusted with the defence of the Netherlands and the French frontier on that side; and though his force was far inferior to that of the invaders, he prevented them from penetrating into France. He gave his assent to the return of the Bourbons, and went to meet the king at Calais. Louis rewarded him with the peerage, the order of St. Louis, and the grand cross of the legion of honour. In March 1815 he appointed him governor of Paris, and Maison continued faithful to his cause when Napoleon returned from Elba, as, instead of joining the emperor, he retired to an estate of his wife's in the Hunderuck. He went back to Paris with Louis, and resumed his functions there, which, however, he resigned on being appointed to the eighth division at Marseilles; and in 1817 he received the title of marquis. He was again entrusted with the government of Paris, but was subsequently succeeded by the duke of Ragusa. His removal is supposed to have been intended as a punishment for his honourable conduct as a peer on the trials which took place in August 1821. In 1828 General Maison was appointed to the French expedition to the Morea, and forced the Egyptians to evacuate the country. After the revolution of

July 1830 he was one of the three commissioners appointed to accompany the deposed king to Cherbourg.

MAISTRE, JOSEPH, COUNT DE, was born at Chamberri in 1753 of a French family, and was a senator of Piedmont at the time of the French invasion in 1792. He left his country in consequence of that event, and afterwards followed his king to Sardinia. In 1804 he was sent ambassador to St. Petersburg, returned to Turin in 1817, and died there in 1821. De Maistre was familiar with the Greek and Latin literature. He was an enemy of liberal principles in religion, politics, and philosophy. As a diplomatist, he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his "Eloge de Victor Amadée III.;" "Considérations sur la France;" "Essai sur le Principe Générateur des Constitutions Politiques," in which he maintains the divine origin of sovereignty; "Soirées de St. Petersburg;" "Du Pape;" and "Du Congrès de Rastadt;" the last in conjunction with the abbé de Pradt.

MAITLAND, SIR THOMAS, a distinguished military officer, who is best known for his services in the Greek islands. He was appointed governor and commander-in-chief in and over the island of Malta and its dependencies on the 15th of July, 1813, and subsequently governor and commander-in-chief of the forces in the Mediterranean. This officer conducted the negotiations and proceedings of the surrender of Parga to the Turks.

The return of Sir Thomas Maitland to the Ionian Islands in 1816 was welcomed by several very flattering addresses, of which we give the following as a specimen:—

"The undersigned inhabitants of Corecra are penetrated with the purest and most lively joy on the happy return of his excellency Sir Thomas Maitland, lord high commissioner; for whom they profess the most respectful devotion, and through whose noble and beneficent measures the felicity of the United States of the Ionian Islands will be established under the magnanimous protection of the august sovereign of the mighty British empire.

"In order that the remotest posterity may know the sentiments which animate them, they have proposed to raise a monument of marble conformable to the annexed design, on which is to be recorded the ever memorable day of the auspicious return of the great personage to whom it is dedicated, as appears by the Greek inscription, of which the following is a translation:—

"To record the epoch of the return from Great Britain of Thomas Maitland, lord high commissioner of his majesty the sovereign protector, to the United States of the Ionian Islands, regulator of their political system, this monument was erected by the citizens of Corecra, to remain to posterity as a testimonial of their individual and general satisfaction."

A triumphal arch of marble of the Ionic order, with an appropriate inscription, was accordingly erected on the esplanade facing the gate of the citadel; and the bronze statue of his excellency occupies the site upon which stood that of the famous Count Shulembourg, erected by the senate of Venice, to commemorate his glorious and intrepid defence of this fortress, and the complete defeat of the Turkish army in 1716, by which he so effectually checked the

progress of Mahometanism in Europe. Sir Thomas Maitland died at Malta in 1824.

MAITLAND, SIR RICHARD, a Scottish lawyer, who was born in 1496, and educated at St. Andrew's, the university of which he left to proceed to France to study the laws. Upon his return, says Mackenzie, he became a favourite of James V., and in the books of sederunt is marked an extraordinary lord of session in 1553. By a letter of James VI. it appears that Sir Richard had served his grandsire, goodsir, goodam, his mother, and himself, faithfully in many public offices. He unhappily became blind before 1561, or his sixty-fifth year; but notwithstanding, he was made senator of the college of justice, by the title of Lord Letherington, in 1561; and in 1562 one of the council and lord-privy seal, which last office he held till 1567, when he resigned it in favour of John, his second son. Sir Richard continued a lord of session during all the troublesome times of the regents in the minority of James VI. till 1584, when he resigned, and died on the 20th March, 1586. One poem of Sir Richard's was published in "The Evergreen;" but no more of his works appeared till they were inserted in the collection published some years ago by Mr. Pinkerton. Besides poems, he left a MS., the title of which was, "The Chronicle and Historie of the House and Surname of Seaton, unto the Moneth of November, in the yeir of God An Thusand Five Hundereth Fifty Aught yeirs. Collectit, writ, and set furth, be Sir Richard de Maitland of Leithingtoun, knight, doughter-sonne of the said hous."

MAITLAND, JOHN, LORD THIRLSTANE, a learned chancellor of Scotland, who was the second son of Sir Richard Maitland. He was born in the year 1537, educated in Scotland, and was afterwards sent to France to study the law. On his return to his native country he became an advocate, in which profession he remained till his father in 1567 resigned the privy-seal in his favour. This office he kept till 1570, when, for his loyalty to the queen, he lost the seal, and it was given to George Buchanan. He was made a senator of the college of justice, or lord of session, in 1581; secretary of state in 1584; and lord high chancellor in 1586. The chancellor's power and influence created him many enemies among the Scottish nobility, who made several attempts to destroy him, but without success. In 1589 he attended the king on his voyage to Norway, where his bride, the princess of Denmark, was detained by contrary winds. The marriage was immediately consummated, and they returned with the queen to Copenhagen, where they spent the ensuing winter. During their residence in Denmark the chancellor became intimately acquainted with the celebrated Tycho Brahe. In 1590 he was created Lord Maitland of Thirlstane. Towards the end of the year 1592 the chancellor incurred the queen's displeasure for refusing to relinquish his lordship of Musselburgh, which she claimed as being a part of Dunfermline. He absented himself for some time from court; but was at length restored to favour, and died of a lingering illness in the year 1595, much regretted by the king. He bears a high character both for talents and integrity among all historians. Besides his Scottish poetry in the Maitland collection, he wrote several Latin epigrams, &c., to be found in the "*Deliciæ Poetarum Scotorum*." The chancellor's only son, John Lord Thirlstane, was

first made viscount and then earl of Lauderdale, by James VI., in 1624.

MAITLAND, WILLIAM, a learned antiquary and topographical writer, who was born at Brechin in Scotland in 1693. He was by profession a hair merchant, but subsequently turned his attention to literature, by which he realised a handsome fortune. He died in 1757. His best work was entitled "*A History of London*."

MAITTAIRE, MICHAEL, a learned critic and bibliographer, born in France in 1688. His parents having fled to England to avoid the persecutions in France, he was educated at Westminster school and Christ Church college, Oxford, where he took the degree of M. A. in 1696. The preceding year he had been made second master of Westminster school, which office he relinquished in 1699, and from that period devoted his time to private tuition and the study of literature. His editions of various Greek and Latin authors are esteemed for their accuracy. His most important literary production is his "*Annales Typographici ab Artis Inventionibus*."

MAJOR, JOHN, a scholastic divine and historian, was born at Haddington in East Lothian in Scotland. He went to Paris in 1493, and studied in the college of St. Barbe under the celebrated John Boulac; from which he removed to that of Montacute, where he studied divinity under the celebrated Standouk. In 1505 he was created doctor in divinity; returned to Scotland in 1519, and taught theology during several years in the university of St. Andrew's. But at length he went back to Paris, and resumed his lectures in the college of Montacute, where he had several pupils, who afterwards became men of great eminence. About the year 1530 he returned once more to Scotland, and was chosen professor of theology at St. Andrew's, of which he afterwards became provost; and died there in 1547. His logical treatises form one immense folio; his commentary on Aristotle's physics makes another; and his theological works amount to several volumes of the same size.

MAJORANO, GAETANO, a celebrated soprano singer, who was born in the Neapolitan territory in 1703. A musician, who had remarked the excellent voice of the boy, advised his father, a peasant, to send him to school at Norcia, afterwards took him into his own house, instructed him, and presented him to Porpora at Naples, who taught him for six years. At the end of that time Porpora told him that he could teach him nothing more, and that he was now the first singer in Italy and in the world. In 1738 he came to England, just after Farinelli's departure, but was not in high favour here. After his return to Italy he sang in several theatres with extraordinary applause, and contributed to extend the florid style of singing. In 1740 he is said to have received 700 sequins for a single night at Venice. He accumulated a large fortune, and purchased the estate of Santo-Dorato, from which he took the title of duke. On a sumptuous house, which he had built, was the inscription, *Amphion Thebas, Ego Domum*. At his death, which took place in 1783, he left his nephew a fortune of 12,000 ducats a year, and his duchy.

MALAGRIDA, GABRIEL, an Italian ecclesiastic, notorious for his intrigues and fanaticism, who was born in 1686, and having become a member of the Jesuits' college, was despatched by that fraternity

as their missionary to Lisbon. Here he acquired considerable popularity by his eloquence and his pretensions to extraordinary sanctity. Being accused of participation in the pretended conspiracy of the duke D'Aveiro against the crown of Portugal, he was thrown into prison by the government; but, instead of being tried by the judicial tribunals, he was delivered over to the inquisition and condemned as guilty, not of treason, but of heresy, uttering false prophecies and seeing visions, and was sentenced to the stake, and executed in September 1761.

**MALCOLM, SIR JOHN.**—Great Britain owes much to the diplomatic and military services of this distinguished individual. He was born at Burnfoot in Dumfriesshire in 1769, and in 1782 proceeded as a cadet to India, where he soon became an excellent Persian scholar. After a short return to his native land, we find him actively engaged as second in council at Madras.

After the termination of the Mysore war by the fall of Seringapatam, it was deemed expedient that a commission should proceed from the supreme governor of India to Baba Khan, in order to ascertain the intentions and power of that prince, and more particularly of Zemaun Shah; and, under the apprehension that the latter was meditating the invasion of Hindostan, to engage the court of Persia to act with vigour and decision against either him or the French, should either attempt to penetrate to India through any part of the Persian territories. For this service, involving the most essential interests of the East India company, Captain Malcolm was selected, and ordered to proceed to Bombay in 1799, there to embark for Persia; and should the season admit of it, to touch at Muscat in his way thither, in order to endeavour to adjust any points relating to the British interests at that place, which the Bombay government should recommend to his attention.

On the 1st of February, 1800, Captain Malcolm reported to the governor-general his arrival at Bushire, and his having concluded an agreement with the Imaum of Muscat, which provided for the future residence there of an English gentleman in the capacity of agent of the British government; and on 20th February, 1801, he transmitted to Bengal copies of two treaties which he had concluded with Persia, the one political, the other commercial. Captain Malcolm reached Bombay on his return from Persia in July, and arrived in Calcutta in September following, when he was appointed private secretary to the governor-general; who stated to the secret committee, that "he had succeeded in accomplishing every object of his mission, and in establishing a connexion with the actual government of the Persian empire, which promised to British natives in India political and commercial advantages of the most important description." On the decease of the Persian ambassador, Hajed Kulleel Khan, who was accidentally shot at Bombay in 1802, Major Malcolm was immediately despatched to that presidency, invested with authority to conduct all affairs respecting the embassy from the king of Persia to the British government, and to make every necessary communication to the king of Persia and his minister; also, with instructions to console, and, as far as possible, compensate the family and relations of the deceased ambassador, and to make the necessary arrangements for their return to Persia. The Bombay government were instructed upon this occasion to receive Major

Malcolm at Bombay with the honours due to an envoy to any foreign state from the supreme British authority in India. In August 1802 Major Malcolm quitted Bengal for Bombay, and returned in November, having, as is stated in a letter from Bengal to the secret committee, "completely succeeded in accomplishing the objects of his mission, without subjecting the honourable company to any considerable expense, or imposing any important permanent burden on the honourable company's finances, &c."

Lieutenant-Colonel Malcolm in 1807 arrived at Fort St. George, on his way to the resumption of his residency of Mysore; in the performance of the duties of which appointment he did not long continue; the political state of Europe, and the increased power and extensive projects of Bonaparte, having, towards the close of the year, furnished fresh occasion for his employment as a diplomatist. Intelligence of the French design of invading India through Persia, and that the invaders would probably be supported in it by the Turkish and Persian states, reached the governor-general, Lord Minto, late in 1807; in consequence of which his lordship appointed Lieutenant-Colonel Malcolm to be the governor-general's political agent, and to be vested with plenipotentiary powers in Persia, the Persian Gulf, and Turkish Arabia. By this appointment the powers of separate political agency possessed by the residents at Bagdad, Bussorah, and Bushire, were suspended; and Lieutenant-Colonel Malcolm was authorized, at any time, when he might judge it to be expedient for the benefit of the public service, to take upon himself the powers of resident at any of those stations. He was also, in addition to his powers as political agent, furnished with credentials as envoy or ambassador to the court of Persia, and to the pasha of Bagdad, in the event of his finding it practicable or expedient to repair in person to either or both of those courts. In April 1808 Lieutenant-Colonel Malcolm quitted Bombay for the Persian Gulf, and arrived at Bushire on the 10th of May, from which place he transmitted to the Bengal government a paper, represented by them to the court of directors as "a very able historical review of the late intrigues of the French in Persia, and of the military operations of Russia on the north-west frontier of that kingdom." The ascendancy which the French government had acquired in the councils of the Persian monarch having, however, rendered all attempts to procure the reception of the British mission unavailing, except through means which Lieutenant-Colonel Malcolm stated at full length in his despatches he deemed derogatory to the British character, he resolved on immediately quitting Bushire, and returning to Calcutta (leaving his secretary, Captain Pasley, to act on any emergency), for the purpose of affording the governor-general, in person, full information respecting the then existing state of affairs in Persia, and of consulting with his lordship upon the most expedient measures to be adopted in consequence thereof by the British government in India. Lieutenant-Colonel Malcolm's return was approved by the Bengal government, though they did not concur in the propriety of some of his anterior proceedings.

In 1809, the state of affairs in Persia being considered by the governor-general to be such as again to require the presence of this officer, provided assurances were received of his suitable reception, he

was re-appointed envoy to the Persian and Arabian courts. Upon his arrival at Bushire, in February 1810, he assumed, in obedience to his instructions, the functions of envoy-plenipotentiary, on the part of the British government in India, to the court of his Persian majesty, where he met with a most gracious and distinguished reception. He remained, however, but a short time in the Persian camp, having requested leave to depart on hearing the nomination in Europe of Sir Gore Ouseley to be his majesty's ambassador at the Persian court. The king of Persia expressed his regret at his early departure, and instituted the order of the Lion and Sun to bestow it upon him. His majesty presented him with the star of this order ornamented with diamonds, and a sword, and also nominated him a khan and sepahdar of the empire. On the 6th of October, 1810, while at Bagdad on his return from Persia, the brigadier-general transmitted to the Bengal government his final report on the affairs of that kingdom; with an account of its geography, internal government, policy, resources, and condition, and accompanied by a map, geographical memoir, and abstracts of the merits of different officers employed under his orders. This report was acknowledged by the government in the most flattering terms.

Brigadier-General Malcolm reached England in 1812, and was met by the court of directors of the East India company with the deepest regard and acknowledgment of his merits. On the 15th of December he received the honour of knighthood. Sir John continued at home till 1816; and during this period, the subject of the renewal of the East India company's charter having come under the consideration of parliament, his evidence was required before committees of the lords and commons.

Sir John Malcolm again proceeded to Bengal in 1817; he was immediately attached as the governor-general's political agent, and, with the rank of brigadier-general, to the force under Lieutenant-General Sir T. Hislop, then about to commence important operations in the Deccan. In the war which followed the defection of the Peishwa, Sir J. Malcolm was appointed to command the third division of the army. In September, Talyra was taken by surprise under the orders of this officer; and early in December he joined Sir T. Hislop at Ougein. On the 21st of the latter month the battle of Mehidpoor was fought, and followed by the complete defeat and dispersion of the hostile army under Mulhar Rao Holkar, which was pursued for eight days by the cavalry and light horse under Sir J. Malcolm. The following remarks are from the general orders issued by the commander-in-chief on the field of battle:—"His excellency must notice the undaunted gallantry with which the charge was made upon the guns, under the conduct and direction of brigadier-general Sir J. Malcolm."

Sir T. Hislop, in his despatch of 23rd December, further observes,—“Your lordship is too well aware of the high professional character and abilities of Brigadier-General Sir J. Malcolm to render it necessary for me to dwell upon them. I shall therefore merely express my admiration of the style of distinguished conduct and gallantry with which the assault on the left of the enemy's position was headed by the brigadier-general, and my warmest thanks for the great and essential aid I have derived from his counsels, as well previous to, as during the action of the 21st instant.” Lord Hastings, advertent to the same

event in his general order of 21st February, 1818, says, “The chivalrous intrepidity displayed by Brigadier-General Sir J. Malcolm in the battle of Mehidpoor, and the admirable tact manifested by him in the subsequent negotiations, advanced the public interest no less than they distinguished the individual.” Mr. Canning, the president of the board of control, after moving the thanks of parliament to Sir T. Hislop, went on to say,—“And to Sir J. Malcolm, who was second in command on that occasion, but who is second to none in valour and renown,—the name of that gallant officer will be remembered in India as long as the British flag is hoisted in that country.” The prince regent expressed his regret that the circumstance of Sir J. Malcolm's not having attained the rank of major-general prevented his creating him a knight grand cross; but his intention to do so was recorded, and in 1821 he received that honour.

After the termination of the war Sir J. Malcolm continued in Malwah for the purpose of making arrangements with the neighbouring states, and establishing the company's authority in that province and the other territories which had been ceded to them. Several treaties were concluded under his orders, in which were displayed his usual zeal and intelligence. The ex-rajah of Nagpore, who had been driven from his throne and capital in consequence of his treachery towards the British government, continued at large, and, after wandering about the country, was admitted into Nagseerghur, of which the killedar, Jeswunt Rao Sar, retained possession for some time after the general pacification of Central India. Military operations were accordingly commenced against this fortress in March 1819, and on the 10th of April it surrendered to the force under Brigadier-General Doveton, the ex-rajah, Appa Sahib having previously fled in disguise, with only one or two followers, and sought refuge beyond the Sutledge. Sir J. Malcolm's assistance in the reduction of this fortress was most handsomely acknowledged by Brigadier-General Doveton in the general orders issued on the occasion. In August 1821 Sir John proceeded by the way of Bombay to Calcutta, where he continued a short time, and then determined to return to England overland for the benefit of his health.

Upon Sir John's arrival at Fort St. George, he obtained from the governor in council of that presidency permission to repair to England; and upon his quitting Madras a general order was issued, in which we find the following well-merited compliment:—"His career has been unexampled, for no other servant of the honourable company has ever, during so long a period, been so constantly employed in the conduct of such various and important military and political duties. His great talents were too well known to admit of their being confined to the mere limited range of service under his own presidency. The exercise of them in different situations has connected him with every presidency, and rendered him less the servant of any one of them than of the Indian empire at large." Sir John arrived in England in April 1822, and soon after was presented with a superb vase, valued at 1570*l.*, as a testimony of respect from the officers who acted under him in the Mahratta war of 1818 and 1819.

Sir John had quitted India with the determination to spend the evening of his life in his native country; but the solicitations of the court of directors, and of his majesty's ministers for Indian affairs, induced him

to again embark in the service of his country, where experience had so fully qualified him to act with advantage. In July 1827 he was appointed to the high and responsible situation of governor of Bombay, which post he continued to fill until 1831, when he finally returned to England, having effected, during the few years of his governorship, incalculable benefits for this country, our Indian territories, and every class of the inhabitants there. Upon his leaving Bombay, the different bodies of the people seemed to vie with each other in giving proofs of the esteem and high consideration in which he was held. The principal European gentlemen of Bombay requested Sir John to sit for his statue, since executed by Chantrey, to be erected in Bombay; the members of the Asiatic society requested a bust of him to be placed in their library; the native gentlemen of Bombay solicited his portrait to be placed in the public room; the East India amelioration society voted him a service of plate; the natives both of the presidency and of the provinces addressed him as their friend and benefactor; and the united society of missionaries, including English, Scotch, and Americans, acknowledged with gratitude the aids they had received from him in the prosecution of their pious labours, and their deep sense of his successful endeavours to promote the interest of truth and humanity, with the welfare and prosperity of his country and his countrymen. These were strong and gratifying incidents in the closing scene of his long and arduous services in our Indian empire.

Shortly after Sir John's arrival in England he was returned to parliament for the borough of Launceston, and took an active part in the proceedings upon several important questions. He frequently addressed the house at length, and his speeches were characterized by an intimate knowledge of the history and constitution of his country. In 1832 Sir John retired to his seat near Windsor, and employed himself in writing his work upon the government of India, which was published early in the spring of 1833, with the view of elucidating the difficult questions relating to the renewal of the East India company's charter.

His last public address was at a meeting at the Thatched House tavern, for the Abbotsford subscription; and on that occasion the sentiment with which he concluded a most animating appeal was, "that, when he was gone, his son might be proud to say that his father had been among the contributors to that shrine of genius." On the day following Sir John was struck with paralysis, which ended in death, May 31st, 1833.

We have hitherto confined ourselves to the political and military career of this distinguished individual; his literary merits cannot be better illustrated than by a reference to the sketch of his literary labours furnished by Allan Cunningham. In his "History of Persia" he thus pleads for the traditional marvels of his introductory chapters: "If we desire to be fully informed of a nation's history, we must not reject the fables under which the few traces that remain of its origin are concealed. These, however extravagant, always merit attention. They have an influence on the character of the people to whom they relate. They mix with their habits, their literature, and sometimes with their religion. They become, in short, national legends, which it is sacrilege to doubt; and to question them would raise in the breast of a

Persian all those feelings which would be excited in that of an Englishman, if he heard a foreigner detract from the great name of Alfred. Such heroes often rise in importance—as far as their example is of value—in proportion as their real history is lost in obscurity; they are adopted as models by the painters and poets of their country; every human virtue is ascribed to them; and men are taught their duty from fables decorated with names which they have learned to venerate from their cradle, and the love of which is cherished with all the enthusiasm of national pride." The accuracy of these remarks must be evident to all who are acquainted with history; they apply to all nations; and the legends of Arthur and his knights in the south, and of Wallace and his companions in the north, cannot but recur to British readers.

This has given an original air and a chivalrous spirit to the works of Malcolm, which render them so acceptable to all who desire to become acquainted with the fortunes of Persia or of Hindostan. He wrote many of his descriptions in the vales, or on the hills, where the battles were fought or negotiations concluded; and he visited in person all the remarkable places in Hindostan, of which his "History of Central India" required him to speak. Of the social natures and domestic habits of the people he speaks from observation. He relates many anecdotes of their warriors, quotes many verses of their poets, and he is pleased when he can give a pithy saying from the lips of their native princes. It is this which renders those histories among the most readable books of the language. Nor has he neglected the doctrines and ceremonies of religion; the mystic and poetic absurdities of the sect of Saafis—in short, all that he considered characteristic or national he has exhibited in his pages. In his "Persian Sketches" he has admitted much which he could not admit into his graver history—these consist chiefly of legends, ceremonies, and scenes; they are all stamped with the impress of the east, and are worth ten thousand of those stories which it was once the practice to manufacture for home consumption, under the name of eastern tales. "The Political History" is less addressed to the general reader, and may be described as learned and liberal; it has been often referred to by men well acquainted with eastern affairs.

The works of Sir John Malcolm are less the offspring of study than of observation: he had seen much, and he has told much. He had a quick eye and a ready understanding, a picturesque skill, and a spirit equally dramatic as historic. His language hovers between the elaborate and the natural, not wholly of the one nor of the other, and yet partaking of the character of both. His reasoning is generally correct, and his thoughts, though not profound, spring naturally out of the narrative, and are not stuck upon it for display. He has much of the sensibility as well as fancy of a poet, and some of the scenes in his history, of both Persia and India, are almost fit for representation.

MALEBRANCHE, NICHOLAS, a French philosopher, who was born at Paris in 1638. His health being delicate, he was classically instructed by a domestic tutor, but afterwards went through courses of philosophy and divinity at the colleges of La Marche and of the Sorbonne. At the age of twenty-two he embraced the monastic life. He applied himself first to ecclesiastical history, and afterwards to

oriental learning and biblical criticism; but, having accidentally met with Descartes's "Treatise on Man," he determined to make himself master of that author's system of philosophy. The result of this study was his celebrated treatise "On the Search after Truth," first printed in 1673, but of which the best edition is that published by himself in 1712. The doctrines of this work, which contains fine thoughts and uncommon reflections, rendered still more striking by his elegant manner of conveying them, are founded upon Cartesian principles, and are in some particulars Platonic. It is principally distinguished by the maintenance of a mysterious union between God and the soul of man, and the doctrine that the human mind immediately perceives God, "and sees all things in him." His next publication was "Christian Conversations." This was followed by "A Treatise on Nature and Grace," which led to several controversial treatises between him and Arnauld. Malebranche also wrote several works on physical subjects, and several papers for the academy of sciences, of which he was admitted an honorary member in 1699. Malebranche was highly venerated for his elevated genius, and nothing could be more amiable and simple than his conversation and manners. As a philosopher, although he agreed with those who preceded him in conceiving ideas to be the immediate objects of perception, he distinguished more than any previous metaphysician the object from the sensation which it creates, and thereby led the way to a right understanding both of our external senses and mental powers.

**MALESHERBES, CHRISTIAN WILLIAM DE LAMOIGNON DE**, an eminent French statesman, descended from a family of distinguished worth and talents. He was the son of William de Lamoignon, chancellor of France, and was born at Paris in 1721. After studying at the Jesuits' college, he qualified himself for the legal profession, and became a counsellor of the parliament of Paris. In 1750 he succeeded his father as president of the court of aids, and was also made superintendent of the press, in both which offices he displayed a liberal and enlightened policy, highly honourable to his talents and character. On the banishment of the parliaments, and the suppression of the court of aids in 1771, Malesherbes was exiled to his country seat, where he devoted his leisure to the study of statistics and agriculture, and the improvement of his estate and of the country around it. After the accession of Louis XVI. he resumed his presidentship over the revived tribunal, and in 1775 was appointed minister of state. Finding his plans for the benefit of the nation counteracted by the influence of others, he resigned his post in May 1776, and went to reside in Switzerland. He was recalled to the king's councils in 1786, when he drew up two memoirs on the calamities of France and the means of repairing them; but his advice was rejected, and he therefore took a final leave of the court. Returning to the country, he continued his patriotic labours, and in 1790 published an essay on the means of accelerating the progress of rural economy in France. He took no part in the proceedings which led to the overthrow of the monarchical government; but on the decree of the national convention for the trial of the king, he emerged from his retreat to become the voluntary advocate of his unfortunate sovereign. His generous attachment to his fallen master excited the jealousy

of the French rulers, and caused his destruction. Shortly after his return home, his daughter, Madame De Rosambo, and her husband, were arrested and conducted to Paris; and his own arrest, with that of his grandchildren, soon followed. Almost his whole family were extirpated by the merciless proscription of his persecutors. Malesherbes was beheaded on the 22nd of April, 1794, and he bore his sufferings with a spirit worthy of his life. Louis XVIII. ordered a monument to be erected to him in the great hall of the Palais de Justice.

**MALET, CHARLES FRANCOIS, BRIGADIER-GENERAL**, was born at Dole in 1754. Having entered the military service, he embraced the cause of the revolution with ardour, and rose rapidly in the first wars of the republic. At the time of Napoleon's assumption of the imperial dignity he openly avowed his republican opinions, and was in consequence left without employment. His connexions with individuals known to be hostile to the imperial government rendered him an object of suspicion, and as no proofs of his guilt could be obtained, he was detained in prison for several years. During his confinement he became acquainted with Lahorie, formerly attached to Moreau's staff, and General Guidal, who had both been in prison for several years. In October 1812 Malet formed the daring plan of overthrowing a prince then at the summit of his power and glory. For this purpose he engaged the co-operation of his fellow prisoners, and having obtained permission to be carried to an hospital, he escaped during the night; and presenting himself to the colonel of a regiment of the Paris guards, he persuaded him that the emperor was dead, and that an opportunity was now offered to restore the republic. He also showed him a decree of the conservative senate, abolishing the imperial government and constituting General Malet commander of Paris. He next hastened to the barracks of the tenth cohort, under the command of Soullier, who had either been previously gained, or was easily made to believe what he desired—the emperor's death and a change of government. Soullier took possession of the Hotel-de-Ville at eight o'clock in the morning, and Frochot, the prefect of Paris, who arrived soon after, was also brought to believe that the emperor had been killed. Measures were taken for establishing a provisional government, and a detachment under General Guidal hastened to the hotel of the police, seized General Savary the minister, conducted him to the prison La Force, and installed Lahorie in his place. Malet next proceeded with some soldiers to the quarters of General Hullin, but could not convince him that the story of the emperor's death was true, nor that the pretended decree was genuine. After some altercation, Malet discharged a pistol at him and wounded him in the jaw, but was immediately seized from behind and thrown to the ground by General Laborde, adjutant of the post, who, on hearing of the military movements, had hastened to General Hullin's quarters, and had been admitted without opposition by Malet's soldiers. The latter, who appeared to be ignorant of Malet's designs, consented to conduct him to prison. His accomplices were soon after arrested, and were examined with him before a court-martial the next day. The examination continued two days and three nights. During the whole time Malet displayed the most imperturbable coolness, avowed his designs, and declared himself ready to

die. He was shot, with the other conspirators, on the 27th of October, 1812, in the plain of Grenelle.

MALHAM, JOHN, a divine, who was for many years vicar of Helton, Dorset. He was a native of Craven in Yorkshire, and, after entering into holy orders, he served a curacy in Northamptonshire. In 1781 he resumed his profession as schoolmaster, and after several changes settled at Salisbury. In 1801 he was presented to the vicarage of Helton; but he latterly resided in London, and was chiefly employed by the booksellers engaged in publishing Bibles and other works. He also published several theological and elementary works; among which are, "The Schoolmaster's Complete Companion, and Scholar's Universal Guide to Arithmetic," 1782; "Two Sermons on National Gratitude;" "The Scarcity of Wheat Considered," 1800; "Lowndes's History of England, brought down to 1812;" "A New Introduction to Book-Keeping," fifth edition; and several other works. He died in 1822, in the sixty-fifth year of his age.

MALHERBE, FRANCIS DE, a celebrated French poet, who was born in 1555, at Caen, of an ancient but decayed family. His father was a Calvinist, but having adopted as a principle that "a gentleman should be of the religion of his prince," he himself adhered to the church of Rome. He entered into the service of Henry D'Angouleme, natural son of Henry II., and married the widow of a counsellor, by whom he had several children. He did not visit court until his fiftieth year, when Henry IV. received him into his service, and gave him a liberal pension, chiefly in consequence of the recommendation of Cardinal Du Perron, who mentioned him as one who surpassed all the French poets who had preceded him. He died at Paris in 1627. Although the recorded incidents of his life be few, numerous testimonies abound of his caustic wit, greediness of presents, and litigious temper, he being generally at war with some one or other of his relations. He was also lax and licentious in respect both to morals and religion. Such was his zeal for the purity of the French language, that, when near expiring, he reproved his nurse for using a word not duly authorized. He may be deemed the father of cultivated French poetry, being not only an excellent versifier, but possessed of many of the qualities of a poet; not indeed of the highest class, but he was ingenious, harmonious, elegant, and sometimes elevated. His poetry consists of odes, stanzas, sonnets, epigrams, and other short pieces, with a few of a devotional cast. He also published translations of Seneca, "De Beneficiis," and a portion of Livy.

MALIBRAN, DE BERIOT, a distinguished vocal performer, the daughter of Signor Garcia, who was well known for his powers as a composer and musician. She was born at Madrid in 1809, and in 1816 proceeded to the continent of America, where she was very successful both as a singer and actress. She was very early in life married to a banker, from whom she was legally divorced, and afterwards married M. De Beriot. After a most successful career on the metropolitan boards, she died at Manchester, on the 23rd of September, 1836.

A remarkable combination of fine qualities concentrated to render M. Malibran the wonder she was to all who beheld her. She appeared to have an instinctive perception of the graceful, the beautiful, and the true in nature. She saw at once what was to be done, and she obeyed the impulse of her feel-

ings: hence the unpremeditated effect of some of her finest actions and attitudes. She also possessed an energy of character that kept those about her, and who watched her progress, in constant admiration; and, added to her genius and energy, she had acquired a spirit of industry that would put to shame the most mechanical plodder. Her voice, which was a contr' alto in character, took a range that was perfectly astonishing. In execution, she kept the listener in a state of wonderment; and in the most complicated fioritures she not only performed all that the flexible mechanicians could achieve, but even there she beat them in their own strong hold, for she was sure to add some exquisite grace entirely her own: and we venture to say, that no mortal ever heard her sing the same piece precisely alike, or repeat a cadence when she has been encored. What is remarkable too, and at once displays her great genius, her cadences and adornments were always in keeping with the character and style of the composition she was singing. Her principal characteristic, however, was expression—and expression in all its features, shades, and varieties; from its loftiest epic flight, embracing the sublime of anger, and the profoundly pathetic, down to the winning, the playful, and even the burlesque. It is needless to recur to her expression in the most prominent parts of the "Sonnambula" and "Fidelio;" but they who remember her in the "Romeo"—how piercing her tones of anguish—how intense the agony of her features; or her look, attitude, and tones, in the last scene of "Gli Orazii e Curiazzii," will store the reminiscence of them among the treasures of high art.

A public journalist, speaking of her private character, says, "Malibran's generosity was unbounded. After the first few years of her career, when she had already gained immense sums, so much had she spent to relieve her first husband, and relatives, and oblige her friends, that nothing was left; and Monsieur Gabriel Delessert, the banker, and other friends, were obliged to make representations to her, and to insist on receiving her money, and not allowing her to give all away. Malibran's generosity was never known to the public; it was exerted in private and in secret. We remember the astonishment of an artist, then in prison for debt, and who had lost all hopes of extricating himself or of supporting his wretched family, at finding 100*l.* under his pillow. It was the medical attendant who had thrust it there, but it was that angel, Malibran, who had prepared this wonder-working fever-draught. Malibran's exertions sometimes made her vacillate in her walk on the stage, and this, with that careless eccentricity which she would often assume to amuse her friends, gave opportunity to her enemies to assert that she had recourse to wine for excitement. Nothing could be less true. Her friends were always persuading her to take more generous drink and food, very naturally convinced that all her exertions required a material to act upon. At the present moment of bereavement of the unhappy husband, we refrain from alluding to her second marriage, through which she leaves a progeny to lament her irreparable loss. Those who knew Malibran's secrets knew those things they would never have suspected, and which explained most honourably all the actions of her life."

MALLET, DAVID, a celebrated Scottish poet, born at Crief in 1700. His parents were in humble circumstances, but by great application he soon acquired a considerable share of classical knowledge

He was first employed as instructor in the family of Mr. Home of Edinburgh, and in 1723 received a similar appointment in that of the duke of Montrose. When his pupils went abroad they were entrusted to his care; and having conducted them through their travels, he returned with them to London. Here, residing in their family, he naturally gained admission to persons of high rank and character, and began to give specimens of his poetical talents.

In 1733 Mr. Mallet published a poem on verbal criticism, on purpose to make his court to Pope. In 1740 he wrote a life of Lord Bacon, which was then prefixed to an edition of his works; but with so much more knowledge of history than of science, that, when he afterwards undertook the life of Marlborough, some were apprehensive lest he should forget that Marlborough was a general, as he had forgotten that Bacon was a philosopher. The old duchess of Marlborough assigned in her will this task to Glover and Mallet, with a reward of 1000*l.* and a prohibition to insert any verses. When the prince of Wales was furnished with a separate establishment, to increase his popularity by patronising literature, he made Mallet his under-secretary, with a salary of 200*l.* a year. Thompson likewise had a pension; and they were associated in the composition of "The Masque of Alfred," which, in its original state, was played at Cliefden in 1740. It was afterwards almost wholly changed by Mallet, and brought upon the stage of Drury Lane in 1751, but with no great success. He had before published two tragedies,—*"Eurydice,"* acted at Drury Lane in 1731, and *"Mustapha,"* acted at the same theatre in 1739. Mr. Mallet's next work was *"Amyntor and Theodora,"* a long story in blank verse; in which there is copiousness and elegance of language, vigour of sentiment, and imagery well adapted to take possession of the fancy. In 1753 his *"Masque of Britannia"* was acted at Drury Lane, and his tragedy of *"Elvira"* in 1763, in which year he was appointed keeper of the book of entries for ships in the port of London. In the beginning of the war, when the nation was exasperated by ill-success, he was employed to turn the public vengeance upon Byng, and wrote a letter of accusation under the character of a plain man. The paper was with great industry circulated and dispersed, and he for his seasonable intervention had a considerable pension bestowed upon him, which he retained to his death. Towards the end of his life he went with his wife to France; but after a while, finding his health declining, he returned alone to England, and died in April 1765.

But little can be said in defence of Mallet's moral character. He was a venal writer in the worst sense of the phrase, and he was certainly a sceptic in religion. But however unamiable in private life, as a poet we must accord him a considerable share of praise. We subjoin the best specimen of his powers, which occurs in a small space. It is entitled "The Reward, or Apollo's Acknowledgments," and was written early in 1757.

"APOLLO, from the southern sky,  
O'er London lately glanced his eye:  
Just such a glance our courtiers throw  
At suitors whom they shun to know:  
Or have you mark'd th' averted mien,  
The chest erect, the freezing look,  
Of Bumbo when a bard is seen  
Charg'd with his Dedication-book?  
But gods are never in the wrong:  
What then displeased the pow'r of song

The case was this:—Where noble arts  
Once flourish'd, as our fathers tell us,  
He now can find for men of parts,  
None but rich blockheads and mere fellows;  
Since drums, and dice, and dissipation,  
Have chas'd all taste from all the nation:  
For is there now one table spread  
Where Sense and Science may be fed?  
Where, with a smile on ev'ry face,  
Invited Merit takes his place?  
These thoughts put Phœbus in the spleen  
(For gods, like men, can feel chagrin),  
And left him on the point to shroud  
His head in one eternal cloud;  
When, lo! his all-discerning eye  
Chanc'd one remaining friend to spy.  
Just crept abroad, as is his way,  
To bask him in the noon-tide ray.  
This Phœbus noting, call'd aloud  
To ev'ry interposing cloud,  
And bade their gather'd mists ascend,  
That he might warm his good old friend;  
Then, as his chariot roll'd along,  
Tun'd to his lyre this grateful song:  
'With talents, such as God has given  
To common mortals, six in seven,  
Who yet have titles, ribbons, pay,  
And govern whom they should obey;  
With no more frailties than are found  
In thousand others, count them round;  
With much good will, instead of parts,  
Express'd for artists and for arts;  
Who smiles if you have smartly spoke,  
Or nods applause to his own joke;  
This bearded child, this gray-hair'd boy,  
Still plays with life as with a toy;  
Still keeps amusements full in view:  
Wise? Now and then—but oft'ner new;  
His coach, this hour, at Watson's door,  
The next in waiting on a w—  
'Whene'er the welcome tidings ran  
Of monster strange, or stranger man,  
A Selkirk from this desert isle,  
Or alligator from the Nile,  
He saw the monster in its shrine,  
And had the man next day to dine:  
Or was it an Hermaphrodite?  
You found him in a two-fold hurry,  
Neglecting for this he-she sight  
The single charms of Fanny Murray.  
Gath'ring from suburb and from city  
Who were, who would be, wise or witty;  
The full-wigg'd sons of pills and potions,  
The bags of maggot, and new notions;  
The sage, of microscopic eye,  
Who reads him lectures on a fly;  
Grave antiquaries with their flams,  
And poets squirting epigrams;  
With some few lords—of those that think,  
And dip, at times, their pen in ink;  
Nay, ladies too, of diverse fame,  
Who are and are not of the game:  
For he has look'd the world around,  
And pleasure in each quarter found:  
Now young, now old, now grave, now gay,  
He sinks from life by soft decay.  
And sees at hand, without affright,  
Th' inevitable hour of night.  
But here some pillar of the state,  
Whose life is one long dull debate,  
Some pedant of the sable gown,  
Who spares no failings but his own,  
Set up at once their deep-mouth'd halloo;  
Is this a subject for Apollo?  
What can the god of Wit and Verse  
Such trifles in our ears rehearse?  
'Know, puppies, this man's easy life,  
Serene from cares, unvex'd with strife,  
Was oft employed in doing good,  
A science you ne'er understood;  
And charity, ye sons of Pride,  
A multitude of faults will hide.  
I at his board more sense have found  
Than at a hundred dinners round:  
Taste, learning, mirth, my western eye;  
Could often there collected spy;  
And I have gone well pleas'd to bed,  
Revolving what was sung or said.  
'And he who entertain'd them all  
With much good liquor, strong and small,  
With food in plenty, and a welcome,  
Which would become my Lord of Melcombe,  
Whose soups and sauces duly season'd,  
Whose wit well-tim'd, and sense well reason'd,  
Give Burgundy a brighter stain,  
And add new flavour to Champaign—  
Shall this man to the grave descend  
Unown'd, unhonour'd, as my friend!

No; by my delty I swear,  
Nor shall the vow be lost in air:  
While you, and millions such as you,  
Are sunk for ever from my view,  
And lost in kindred darkness lie,  
This good old man shall never die:  
No matter where I place his name,  
His love of learning shall be fame."

MALLET, EDMUND, was born at Melun in 1713, and enjoyed a curacy in the neighbourhood of his native place till 1751, when he went to Paris to be professor of theology in the college of Navarre, of which he was admitted a doctor. Boyer, the bishop of Mirepoix, was at first much prejudiced against him; but being afterwards undeceived, he conferred upon him the see of Verdun as a reward for his doctrines and moral conduct. Jansenism had been imputed to him by his enemies with this prelate; and the "Gazette" accused him of impiety. Either of these imputations was equally undeserved by the abbé Mallet: as a Christian, he was grieved at the disputes of the French church; and as a philosopher, he was astonished that the government had not, from the very beginning of those dissensions, imposed silence on both parties. He died at Paris in 1755, at the age of forty-two. The principal of his works are, "*Principes pour la Lecture des Poëtes*," "*Essai sur l'Etude des Belles-Lettres*," "*Histoire des Guerres Civiles de France sous les Regnes de Francois II., Charles IX., Henri III., et Henry IV.*" translated from the Italian of D' Avila. In Mallet's works on the poets, orators, and the belles-lettres, his principal object is to explain with accuracy and precision the rules of the great masters, and to support them by examples from authors ancient and modern. The style of his different writings, to which his mind bore a great resemblance, was easy and unaffected. But what most rendered his memory estimable was his attachment to his friends, his candour, moderation, gentleness, and modesty. He was employed to write the theological and belles-lettres articles in the "*Encyclopédie*;" and whatever he wrote in that dictionary was in general well composed. Abbé Mallet was preparing two important works when the world was deprived of him by death. The first was "*Une Histoire Generale de nos Guerres depuis le Commencement de la Monarchie*;" the second, "*Une Histoire du Concile de Trente*," which he intended to place in opposition to that of Father Paul translated by Father le Courayer.

MALMESBURY, WILLIAM, an English historian of the twelfth century, who was born in Somersetshire, on which account he was sometimes called Somersetanus. He states that when he was a child he had a great inclination for learning, which was encouraged by his parents, and it is supposed that he was educated at Oxford. He became a monk of Malmesbury and was elected librarian of the monastery. He studied all the sciences of his time, but attached himself particularly to history, and finding that a satisfactory account of his own country was wanting he determined to write one, "not," as he himself says "to display his learning, which is no great matter, but to bring to light things that are covered with the rubbish of antiquity." His "*De Regibus Anglorum*" is a general history of England, in five books, from the arrival of the Saxons in 449 to the 26th Henry I. in 1126; a modern history in two books from that year to the escape of the empress Maud from Oxford in 1143; with a church history

of England in four books, published in Sir H. Saville's collection. His "*Antiquities of Glastonbury*" was printed by Gale, and his "*Life of St. Aldhelm*" by Wharton. He died in 1148.

MALONE, ANTHONY, a distinguished Irish lawyer, who was born in 1700. He was admitted a gentleman commoner of Christ Church, Oxford, in the year 1720; and in 1726 was called to the Irish bar, where he continued to practise for fifty years, the brightest ornament of his profession. In 1727 he was elected representative for the county Westmeath, which he continued to represent to the time of his death, except during the period which elapsed from the death of George II. in 1760 to the election in 1768. In 1740 he was appointed his majesty's prime sergeant at law, at that time the highest office in his profession, and which he lost in January 1754, because he warmly supported in the house of commons their right to dispose, without the previous consent of the crown, of the unappropriated surplus of revenue raised by act of parliament.

Under the duke of Bedford's government in 1757 he was appointed chancellor of the exchequer in Ireland, from which office he was removed in 1760, after having filled it with consummate ability for above two years, during which time he regularly attended the court, and decided all equity cases with such complete satisfaction to all parties that there never was an appeal from his decision. His removal from office on this, as on the former occasion, was the consequence of his asserting the rights of the house of commons against the encroachments of prerogative exercised at this time in an arbitrary manner. After this he resumed his barrister's gown, and was soon afterwards honoured with a seat in the privy council and a patent of precedence at the bar before any of the law officers of the crown. He continued in possession of full business to the week before his death, which took place on the 8th of May, 1776, after an illness of eight days.

The following character of this distinguished man is abridged from a sketch contained in a work of one of his contemporaries, and we regret that the limits of this work do not permit us to transcribe it entire:—

"The singular modesty, disinterestedness, and integrity of this accomplished orator added such a grace and lustre to his consummate abilities, that it was impossible not to love and respect, as well as admire him.

"The profession in which he was engaged, and of which he had the profoundest knowledge, was peculiarly calculated to display the soundness of his judgment and the fertility of his invention. The clearness and strength of his conceptions, and the simple and perspicuous method in which he arranged the most complicated subjects, made conviction appear the natural and necessary result of his eloquence, inasmuch that when he spoke on the side of truth and justice, and addressed an able and upright judge, he usually swayed and decided his opinion by a luminous statement of the question in dispute, which he afterwards enforced by accumulated arguments, urged with such weight, and placed in such various lights, that they seldom failed to force conviction on the slowest apprehensions and most unwilling minds. If he could be said to have any defect as an advocate, it resulted from that integrity of understanding which formed the basis of his character as a lawyer and a judge.

He was never perplexed with subtleties himself, and was unwilling, we had almost said unable, to perplex and mislead others. His irresistible power of persuasion seemed therefore in some measure to desert him when his duty to his client called on him to enforce doctrines which the rectitude of his judgment had already condemned."

**MALONE, EDMUND**, a commentator and editor of Shakspeare, who was born at Dublin in 1741. After completing his studies at Trinity college, he entered at the Inner Temple, London, and was called to the bar in 1767. Possessing a competent fortune he gave up his profession and employed himself in literary pursuits. After having been the coadjutor of Steevens in his edition of "Shakspeare's Plays," Mr. Malone quarrelled with that gentleman, and published an edition of his own in eleven volumes. He also published "An Inquiry into Certain Papers attributed to Shakspeare;" "Biographical Memoirs of Sir Joshua Reynolds, Dryden, W. Gerrard Hamilton, &c." He died in May 1812.

**MALPIGHI, MARCELLO**, an eminent Italian physician and anatomist of the seventeenth century, who was born in 1628 near Bologna, and studied at the university of that city. He was admitted M. D. in 1653, and three years after was appointed to the medical chair. The grand duke of Tuscany invited him to become professor of medicine at Pisa, where he staid three years, and in 1660 returned to occupy his former office at Bologna. He was tempted by a high stipend to accept the professorship of medicine at Messina in Sicily; but the jealousy of his colleagues rendered him uneasy and he again settled at Bologna in 1666. He was elected a fellow of the royal society of London in 1669, and communicated to that association various anatomical discoveries relative to the minute structure of animal bodies, the results of microscopical observations. Pope Innocent XII., in 1691, called him to Rome and appointed him his physician, chamberlain, and domestic prelate, which posts he held till his death in 1694. His works relating to anatomy, physiology, and vegetable anatomy, comprise much curious and important information on the brain, the nerves, the spleen, the uterus, &c.; also on silk worm, the formation of the fœtus in the egg, on glands, on the anatomy of vegetables, &c.

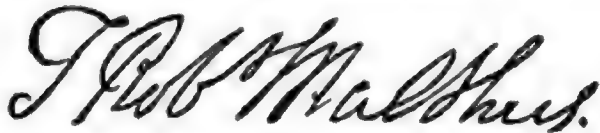

**MALTE-BRUN, CONRAD**, a learned geographer and active political writer, who was born in 1775 in the Danish province of Jutland. His father destined him for the church; but the son had no taste for theology, and while at the university of Copenhagen he gave himself up to literary pursuits, published a volume of poems, and edited a theatrical journal. The father was of the aristocratic party, which called for a war with France: the younger was a partisan of freedom, and wrote in favour of the emancipation of the peasants and the liberty of the press. A party having arisen which demanded the establishment of a free constitution, Malte-Brun became one of the most active members of it. In 1796 he published, against feudality and the coalition of sovereigns, a bitter satire called "The Catechism of the Aristocrats." This drew upon him a prosecution, which compelled him to take refuge in Sweden; and while there he put to press some poems which had been read to the academy of Stockholm. When Count Bernstorff was on his death-bed he recommended to the prince royal to recall Malte-Brun, and

employ him in a diplomatic capacity. In consequence of this the exile returned to Denmark in 1797, and was favourably received by the ministers; but having publicly attacked some of their arbitrary measures, he was again under the necessity of taking flight to Sweden, whence he soon after removed to Hamburg. It is said to have been about this period that he became either the founder, or one of the most active members, of a secret society called the united Scandinavians, the object of which was to unite the three kingdoms of the North into one federative republic.

At a somewhat later period he was also connected with another association of the same kind, and this object he seems to have zealously pursued for many years: he did not indeed desist from it till after the downfall of Napoleon. His schemes excited so much alarm, that Paul of Russia and Gustavus of Sweden demanded from the Danish government the punishment of those who were engaged in it. A prosecution was accordingly commenced against Malte-Brun, who was then at Paris, and he was sentenced to banishment. He settled at Paris in 1799, and continued to reside there till his death, which took place in 1826, devoting himself to the labours of literature, particularly to geographical subjects. Between 1804 and 1807 he published, in conjunction with Mentelle, "Political, Physical, and Mathematical Geography," in sixteen octavo volumes. In 1807 appeared his "Picture of Poland;" and in 1808 he began a periodical work, with the title of "Annals of Voyages, Geography, and History," which extended to a large number of volumes. In 1814 and 1815 he produced another periodical called "The Spectator," which was completed in three volumes. His "System of Universal Geography" is the most complete of all the geographical systems. Malte-Brun was also connected with "The Journal of Debates," and other papers.

**MALTHUS, THOMAS ROBERT**, the son of Daniel Malthus, of Albury, near Guildford, a gentleman of considerable erudition, and the suggester of the work on population ascribed to his son, which appeared anonymously in 1798, and had its foundation in Wallace on the numbers of mankind, and Lucas on happiness. He received his education at Jesus college, Cambridge, of which college he was subsequently a fellow. The "Essay on the Principles of Population," printed under his name in 1803, obtained a rapid circulation, and was translated into French by Prevost, professor of natural philosophy at Geneva. Its leading principle is, that population has a tendency to increase more rapidly than the means of subsistence. This work has met with much opposition, and has lost much of its early reputation. His next work was "A Letter to Samuel Whitbread, Esq., on his Proposed Bill for the Amendment of the Poor Laws." He afterwards published "Observations on the Effect of the Corn Laws, and of a Rise or Fall in the Price of Corn on the Agriculture and General Wealth of the Country;" "An Inquiry into the Nature and Progress of Rent;" "The Grounds of an Opinion on the Policy of Restricting the Importation of Foreign Corn;" and additions to the "Essay on the Principles of Population." When the East India company established the college at Hertford, Mr. Malthus was appointed professor of history and political economy; and, on the subject of this institution, he published "A Letter to Lord Grenville;" and "Statements respecting the East India College." He was also the author of "Principles

of Political Economy," and "Definitions in Political Economy." We subjoin his autograph.

MALTON, THOMAS, an artist and mathematician, who was born in 1726. He is principally known as the author of a work entitled "A Royal Road to Geometry." He also published "A Complete Treatise on Perspective in Theory and Practice on the True Principles of Dr. Brook Taylor." Mr. Malton died in February 1801.

MANCO CAPAC, an inca of the Peruvians, who was the twelfth in ascent from the inca who reigned at the time of the Spanish invasion in 1532, an interval computed by the natives at about 400 years. Their tradition was, that this person, with Mama Oella his wife, and sister, appeared suddenly in an island of the lake Titiaca, and declared themselves to be children of the sun, sent down to civilize and instruct them. Manco accordingly taught the men agriculture and other useful arts, whilst his wife instructed the women to spin and weave. He taught the Peruvians to revere internally, as the highest and unknown deity, Pachakamak, the soul or support of the world; externally, however, and as an inferior and visible deity, the sun, his parent; and he ordered sacrifices to be offered to the latter, as the benefactor of men. Perhaps some stranger, from a civilized land, appeared in Peru, and employed religion to procure an ascendancy which enabled him to form a regular government. Manco Capac died after a long and prosperous reign, and, as far as tradition may be relied upon, seems justly to have been entitled to rank among the benefactors of mankind by the benevolence of his institutions.

MANDEVILLE, BERNARD, a writer and physician of considerable temporary celebrity, who was born in Holland about 1670. He was probably of English extraction, as he fixed his residence in this country, and wrote his works in the English language. His most celebrated production is the fable of "The Bees, or Private Vices made Public Benefits," first printed in 1723. The reasoning in this work is founded on the sophism, that the luxury and superfluity which mark the advanced stages of society, and the vices which they engender, are often the causes of national prosperity, and hence the necessary prevalence of vicious principles in human nature. Consistently with this doctrine, his general views of mankind are of the most disparaging tendency; and he declares against all attempts to exalt the humble classes by education. Many answers appeared, among which was one by Bishop Berkeley, to whom he replied in 1723, in his "Letter to Dion." He died in 1733.

MANDEVILLE, SIR JOHN, a celebrated English traveller of the fourteenth century, who was born at St. Alban's. He was of a respectable family, and a physician; but a desire to visit foreign countries induced him, in 1332, to set out upon a course of travels, in which he is said to have spent thirty-four years. During this period, according to his own account, he visited the greater part of Asia, Egypt, and Libya, making himself acquainted with many languages, and collecting a great mass of information,

true and false, which he committed to writing in Latin, French, and English. He died at Liege in 1372, where a monument is erected to his memory, the inscription on which denominates him "John de Mandeville, alias De Barba, Lord of Campoli." The only genuine edition of his travels, entitled "The Voiage and Travaile of Sir John Mandevile, Knight," was printed from an original manuscript in the Cotton library. His extreme credulity in the collection of absurd and fabulous stories is only surpassed by his unblushing indulgence in the most extravagant fictions.

MANUELLI, PIETRO, a comic singer, who, about the year 1750 went at the head of a company of Italian singers to Paris, and gained the public favour by his comic talent. A warm dispute arose between the favorers of the modern Italian music and the old French style. The parties were called Buffonists and Antibuffonists, and the chiefs of the parties were Grimm and Rousseau. The Italian music was victorious.

MANESSE, RUDIGER VON.—This brave Swiss was a native of Zurich, and in 1336, when the aristocrats of the city, expelled by the burgomaster Bruns, threatened to return with the support of Austria, he received the chief command from his fellow citizens, was victorious, and saved the liberty of Zurich. After the death of Bruns he was chosen burgomaster. He was a lover of poetry, and formed a collection of love-songs, called after him "The Manesse Collection." It remained until the beginning of the seventeenth century in Switzerland, but was then carried off, and, during the thirty years' war, found its way to Paris, where it was discovered in 1726 by Bartenstein. This collection is important in the history of German literature.

MANETHO, an ancient Egyptian historian, who was high priest of Heliopolis, in the reign of Ptolemy Philadelphus, about 304 B. C. He wrote in Greek a history of Egypt, from the earliest times to the last years of Nectanebis, and pretended that he had taken it from the pillars of the first Hermes Trismegistus; the inscription on which, after the flood, was translated into the Greek language, but written in the sacred characters, and deposited in the sacred recesses of Egypt. The manifest absurdity of his pretensions induced several writers to think that some mistake or corruption had taken place in the passage of Eusebius which relates it. The work of Manetho, which is lost, consisted of three parts, the first of which contained the history of the gods or heroes, and the second and third that of the twenty dynasties of kings, which, having been epitomized by Julius Africanus, are recorded by Eusebius. Several fragments of Manetho are preserved by Josephus, in his work against Apion.

MANFREDI, EUSTACHIO, an eminent mathematician and astronomer, who was born in 1674 at Bologna in Italy. He applied himself to the cultivation of mathematical science, and in 1698 was appointed professor of mathematics in the university of Bologna. In conjunction with Victor Stancari, he commenced a series of astronomical observations, of which he afterwards published an account in his "Schedæ Mathematicæ." In 1703 appeared his treatise on the solar maculæ; and the following year he was chosen regent of the college of Montalto, and also surveyor-general of the rivers and waters of the Bolognese territories. In 1705 he published a work

on the reformation of the calendar; and he afterwards began the composition of his "*Ephemerides Motuum Cœlestium*," which he carried on from 1715 to 1725. On the foundation of the institute of Bologna in 1712, Manfredi was appointed astronomer to that establishment. He was admitted an associate of the royal academy of sciences at Paris, and in 1729 a foreign member of the royal society of London. He died in 1739. Besides the works already noticed, he was the author of several other mathematical and astronomical productions.

MANGET, JOHN JAMES, an eminent physician, who was born at Geneva in 1652. The elector of Brandenburg made him his first physician in 1699, in which post he continued till his death, which took place at Geneva in 1742. He wrote many works; the best known of which are a collection of several pharmacopœias in folio, "*Bibliotheca Pharmaceutico Medica*;" "*Bibliotheca Anatomica*;" "*Bibliotheca Chemica*;" "*Bibliotheca Chirurgica*;" "*A Bibliotheca of all the Authors who had written on Medicine*."

MANGEY, THOMAS, an English divine, who was born at Leeds in 1684. He was educated at Cambridge, where he took his degrees and entered holy orders. After receiving various church preferments, he was ultimately advanced to the see of Durham, and died in 1755. He was the author of a great number of theological works, the most admired of which was entitled "*Practical Discourses upon the Lord's Prayer*, preached before the honourable Society of Lincoln's Inn."

MANES.—Of this extraordinary philosopher, whom the orientals called Mani, the fathers of the church, terming likewise his adherents Manichees—history contains two different accounts. The older account, contained in the historians of the Christian church, seems far more credible than the Arabic version of the tenth century, which makes him an accomplished magician, a skilful painter, and a Christian priest, but says nothing particularly new respecting him. According to the first account, he became, when a boy, a slave, under the name of Cubricus, to a wealthy widow in Persia, at whose house he met with the four books of Scythianus, an Egyptian enthusiast, of whom nothing more is known, which had been left her by his scholar Terebinthus, or Buddas, entitled "*Mysteries, Chapters, Gospel, and Treasury*." By the perusal of these books he was led to his doctrine of the world and of spirits, framed from the dualistic ideas of the Chaldeans, together with the systems of the Gnostics. Being left the heir of his mistress at her death, he assumed the name of Mani, and sought to rear, like Mohammed, on the foundation of these books, a new religious philosophy, for which he acquired disciples. The reputation of his wisdom caused him to be invited to the court of Sapor, king of Persia, where he was imprisoned, because the sick son of this king had died under his care. His scholars brought him information of the obstacles which Christianity had thrown in the way of his doctrines. The reading of the Holy Scriptures of the Christians now suggested to him the idea that he was called to the purification of Christianity from Jewish and hierarchical deformities, and to the diffusion of a mysterious doctrine, unrevealed by the apostles—nay, that he was the Comforter promised in the New Testament. Having escaped from prison, and collected new disciples at

Arabion, a fortress on the frontiers of Mesopotamia, he sought, under the name of an apostle of Christ, and, according to the Arabic narrative, favoured by Sapor's successor, Hormizdas, A. D. 272, to convert the Christians in those regions to his doctrines. While engaged in these endeavours, he is said to have been twice overcome by Archilaus, a Christian bishop at Kaskar, in Mesopotamia, in two disputations; to have incurred again the suspicion of the Persian court, and, in the year 277, to have been executed (according to the Christian account flayed alive) at the command of King Varaces.

Proceeding on the ground of an eternal opposition of good and evil, mingling the philosophy of Zoroaster with his arbitrary versions of biblical doctrines, his system possesses but little in common with Christianity, except the language. He assumes two principles, independent of each other; one of good—the God, without form, in the kingdom of light; and one of evil—the hyle, or devil, of colossal stature and human shape, in the darkness of matter; the former strengthened by two emanations, created in the beginning, the son and the spirit, and superior to the latter, both surrounded by innumerable similar æons, or elementary natures, proceeding from them, which dwell in the five elements or spheres, that rise one over the other in the kingdom of good, viz., light, clear water, clear air, genial fire, and pure ether; and, in the kingdom of evil, darkness, or earth, troubled water, stormy air, consuming fire and smoke, from each of which proceed congenial creatures. During an internal war of the always discordant powers of darkness, the defeated party discovered, from the high mountains on the frontiers, the kingdom of light, hitherto unknown to the devil. In order to conquer it, the devil made peace with his species. The good God endeavoured to subdue his enemies by means of artifice and love. The prince of darkness, having eventually been defeated in the contest, produced the first parents of the human race. The beings engendered from this original stock consist of a body formed out of the corrupt matter of the kingdom of darkness, and of two souls, one of which is sensual and owes its existence to the evil spirit; the other, rational and immortal, a particle of the divine light, which had been carried away in the contest, by the army of darkness, and immersed into the mass of malignant matter. The earth was created by God out of this corrupt mass of matter, in order to be a dwelling for the human race, that their captive souls might, by degrees, be delivered from their corporeal prisons, and their celestial elements extracted from the gross substance in which they were involved. With this view, God produced two beings from his own substance, Christ and the Holy Ghost; for the Manichæans held a consubstantial Trinity. Christ, or the glorious Intelligence, called by the Persians Mithras, subsisting in and by himself, and residing in the sun, appeared in due time among the Jews, clothed with the shadowy form of a human body, to disengage the rational soul from the corrupt body, and to conquer the violence of malignant matter, and he demonstrated his divine mission by stupendous miracles. This Saviour was not man: all that the New Testament relates respecting the humanity of Jesus was merely appearance, even his death and resurrection; but his sufferings are emblems of the purification by self-denial, death, and new life, necessary for corrupted men. His cruci-

fixion, in particular, is an allegory of the torments of the soul, which is fastened to matter as to a cross. When the purposes of Christ were accomplished, he returned to his throne in the sun, appointing apostles to propagate his religion, and leaving his followers the promise of the paraclete, or comforter, who is Mani the Persian.

Those souls who believe Jesus Christ to be the Son of God, renounce the worship of the God of the Jews, who is the prince of darkness, and obey the laws delivered by Christ, and illustrated by Mani, the comforter, are gradually purified from the contagion of matter; and, their purification being completed after having passed through two states of trial, by water and fire, first in the moon and then in the sun, their bodies return to their original mass (for the Manichæans derided the doctrine of the resurrection of bodies), and their souls ascend to the regions of light. But the souls of those who have neglected the salutary work of purification pass, after death, into the bodies of other animals, or natures, where they remain till they have accomplished their probation. Some, however, more perverse and obstinate, are consigned to a severer course of trial, being delivered over, for a time, to the power of malignant aerial spirits, who torment them in various ways. After this, a fire shall break forth and consume the world, and the prince and powers of darkness shall return to their primitive seats of misery, in which they shall dwell for ever. Between these seats and the kingdom of light the souls of those not wholly purified keep eternal watch, that both may remain as they were from the beginning. With this system of religion, which was contained in the books of Scythianus and Manes' own treatises, letters, and apocryphal writings, but, at present, exists only in the fragments found in the ancient authors, especially in St. Augustine, against the Manichees, the moral system of this sect corresponds. It divides the Manichees into two classes: the elect are to abstain from wine, flesh, and all animal food, marriage and sexual indulgences, from music, the possession of earthly goods, and all luxury, as well as from war, labour, and doing injury to the vegetable world, and even from plucking fruits; are to kill no animals but vermin, and devote their life to pious contemplation. More was allowed the auditors, or more imperfect. By their labour, they had to support themselves and the elect, and place their happiness in poverty. The head of all was Mani, with twelve disciples, among whom Thomas, Buddas, and Acuas, from whom the Manichees were also called Acuanites, deserve mention. The Manichæan congregations were superintended by bishops, of whom Mani ordained seventy-two, by elders and deacons, all from the class of the elect, in which there were also sainted virgins. These ecclesiastics had, however, merely the authority of teachers, the church government being democratically administered by the congregations. Temples, altars, images, victims, and other sensible aids of divine worship, were not allowed: their worship consisted of singing, prayers, the reading of their sacred books, and lecturing. The supper they celebrated without wine, and, like the primitive Christians, often delayed baptism to a mature age. Of the fasts and festivals of the Christians, they observed only that which commemorated the death of Jesus, and Sunday—the latter with strict fasting. In March they celebrated the anniversary of the death

of Mani, on which day a splendid pulpit, five steps in elevation, was erected in their simple halls of assembly for Mani, then present in the spirit.

They claimed the title of Christians, but, notwithstanding the reputation of extraordinary purity of morals, conceded them even by their enemies, they had to suffer, after the fourth century, more cruel persecutions than other heretics. Till this time they had spread with great rapidity from Persia, where they had their origin, through Syria and Asia Minor, to Northern Africa, and even as far as Italy. In Northern Africa, where they had many, though not numerous congregations, with separate bishops, they were exterminated, in the fifth century, by the Vandals; in the Roman empire, especially in Italy (whither numbers of them had fled from Africa), by the persecutions of Christian emperors and episcopal excommunications. Being finally suppressed in Persia also, they took refuge, after the beginning of the sixth century, partly in the heathen regions of Eastern Asia, where they seem to have had an influence on the formation of Lamaism, partly in the obscurity of secret brotherhoods, and appeared, in subsequent centuries, under different names. The Priscillianists, Paulicians, and Catharists had much in common with the Manichees: their name was, however, given to heretical sects and societies in the middle ages, as to the Canonici, burnt at Orleans in 1022, frequently without reason, and merely to excite the popular hatred.

MANLEY, MRS., the celebrated writer of the "Atalantis." She was the daughter of Sir Roger Manley, the reputed author of the first volume of the "Turkish Spy." She lost her parents very early, and after having entered into a false marriage with her guardian, who was her cousin, and who afterwards deserted her, she was patronised by the duchess of Cleveland, mistress of Charles II. But the duchess grew tired of Mrs. Manley in a few months, and withdrew her protection. After this she wrote her first tragedy, called "Royal Mischief," which was acted with great applause in 1696. She afterwards wrote four volumes called "Memoirs of the New Atalantis," in which she satirized the characters of many distinguished personages, especially those who had a principal concern in the revolution. A prosecution was commenced against her for this work; but whether those in power were ashamed to bring a woman to trial, or whether the laws could not reach her disguised satire, is not known, but she was discharged. She afterwards wrote several plays, poems, and letters. She died in 1724.

MANILIUS, MARCUS, a Roman poet, who flourished, probably, in the Augustan age. The circumstances of his life are unknown. He is less remarkable as a poet than as being the Roman who, in imitation of Aratus, undertook a didactic poem on astronomy. Of this poem we have but five books. It is entitled "Astronomica." It is valuable chiefly as a work of science: it contains, however, a few beautiful and splendid passages, particularly in the introductions.

MANLIUS, MARCUS CAPITOLINUS, a noble Roman, who lived about 390 B. C. When the Gauls under Brennus had captured Rome and were besieging the Capitol, on a dark night they determined to surprise the citadel. They had already reached the foot of the walls; the sentinels, thinking them secure, had fallen asleep, and the enemy had already disco-

vered a vulnerable point, when the garrison was awakened by the cackling of some geese, which were dedicated to Juno. All rushed to their arms; Manlius was the first who reached the place of danger. Two of the Gauls had gained the summit; one of them fell under his sword, and the other he thrust over with his shield. His example animated the rest. The Capitol was saved, and Manlius received the surname Capitolineus. Having afterwards proposed a law to free the people from taxes, the senate was excited against him, and he was arrested and imprisoned as a disturber of the peace. But the people looked up to him as their greatest benefactor, and with one voice demanded his liberation. It was granted; but his restless spirit led him to new enterprises; he even aimed at the sovereignty, and the tribunes of the people became his accusers. He was condemned to death, and thrown from the Tarpeian rock, B. C. 383.

**MANLIUS, TITUS TORQUATUS**, a Roman consul and general, who was the son of Manlius Imperiosus. On account of a defect in his speech his father was unwilling to carry him into the city, and kept him in the country among the slaves. This conduct appeared so unjust to the tribune, Marcus Pomponius, that he summoned the father before him to answer for himself. The son, indignant that his father should be persecuted on his account, immediately hastened to the house of the tribune with a dagger in his hand, and forced him to swear that he would proceed no further. This filial piety made such an impression on the people that they chose Manlius military tribune for the next year. He marched with the army against the Gauls, one of whom challenged the bravest Roman to single contest. Manlius accepted the challenge, conquered his adversary, and encircled his own neck with the collar or torquis of the Gaul, in consequence of which he received the surname of Torquatus, which he transmitted to his posterity. Some years after, he was appointed dictator. He was the first Roman who ever held this office without having been consul. He was afterwards consul, and held the consulship in the Latin war, B. C. 340. Contrary to his express orders that no Roman should engage in combat without command out of the ranks, his son, remembering his father's victory, accepted a challenge to single contest from one of the chiefs of the enemy. He came off victorious, and laid the spoils of the enemy at his father's feet. He turned reluctantly from his son, gave him the crown of victory, and immediately ordered the lictor to execute upon him the punishment of his disobedience. This instance of severity secured to Manlius the most implicit obedience. A few days after he defeated the enemy. In the battle, his colleague, Decius Mus, devoted his life to his country. He then retired to private life. *Manliana edicta* became a proverbial expression for commands of severe justice.

**MANNING, OWEN**, an antiquary and topographical writer, who was educated at Queen's college, Cambridge, where he took the degree of B. D. in 1753. He subsequently entered into holy orders, and was advanced to the rectory of Pepperharrow in Surrey, where he died in 1801. His principal work was entitled "*Dictionarium Saxonico et Gothico-Latinum Auctore Edvardo, Lye edidit et auxit O. M.*" His "*History of Surrey*" was subsequently published by Mr. Bray.

**MANNERT, CONRAD**, a distinguished German scholar, who was born at Altdorf in 1752. He was first teacher at the St. Sebaldus school in Nuremberg, and in 1788 at the Ægidian gymnasium there. In 1797 he was made *professor ordinarius* of philosophy at Altdorf; in 1808 of history at Landshut; and in 1826 of geography and statistics at Munich.

**MANOEL, DON FRANCESCO**, the most celebrated lyric poet of modern Portuguese literature. He was born at Lisbon in 1734. His talent was first known to foreigners, whom he attended as a cicerone, after the earthquake of Lisbon in 1755. His poems are also popular among his countrymen. The one on virtue has been generally admired. His enemies, jealous of his reputation, endeavoured to render his opinions suspicious, for which they found means in his expressions respecting toleration, and in his translation of the "*Tartuffe*" of Molière. Cited before the inquisition, he disarmed the agent of the holy office, and fled to Paris, where he ever after continued to reside. His poems, under the title of "*Versos de Filinto Elysio*," fill several volumes, and his odes and translation of Lafontaine's Fables stand high in public estimation. He died at Paris in 1819.

**MANSFELD**.—The name of one of the most ancient families of German counts, who take their name from the castle of Mansfeld in Upper Saxony. Peter Ernst von Mansfeld was the natural son of Peter Ernst, count of Mansfeld, governor of Luxemburg and Brussels, and the archduke Ernst of Austria, godfather to the young Peter, educated him in the catholic religion. He was of service to the king of Spain in the Netherlands, and to the emperor in Hungary, in consequence of which the emperor Rodolphus II. legitimated him. But when he was denied the dignity and estates which his father had possessed in the Netherlands, and which had been promised to him, he in 1610 embraced the Calvinistic doctrines, and, joining the protestant princes, became one of the most formidable enemies of the house of Austria. In 1618 he led troops to the assistance of the revolted Bohemians, fought a long time for the elector Frederic of the palatinate, devastated the territories of the spiritual princes, was several times beaten, but always contrived to make head anew. In 1625 he collected an army by the aid of English and French money, and intended to penetrate into the Austrian hereditary states, but was beaten by Wallenstein near Dessau; yet he continued his march to Hungary to join Bethlem Gabor, prince of Transylvania; but the latter having changed his views, Mansfeld disbanded his troops, intending to come to England by way of Venice. But not far from Zara he died, in 1626, in his fortieth year. He was buried at Spalatro. At the approach of death he ordered his armour to be put on, and stood up, leaning on two of his attendants to await the last enemy. Mansfeld was one of the greatest generals of his time. With great understanding, which he showed in his diplomatic transactions, he united overpowering eloquence and inexhaustible resource. The Lutheran line of the house of Mansfeld became extinct in 1710; in 1780 the last male of the catholic line died. His only daughter brought all the allodial estates of the family, by marriage, to the rich Bohemian house of Colloredo, which has ever since borne the name of Colloredo Mansfeld. The former county of Mansfeld was in 1814 added to the Prussian government of Merseburg.

**MANSFIELD, WILLIAM MURRAY, EARL**

OF, was the fourth son of David, Lord Stormont. He was born at Perth in Scotland, in March 1705. He received his education at Westminster school, and Christ Church, Oxford, and then made the grand tour; and on his return became a student at Lincoln's Inn, and after the usual term of probation was called to the bar. He gradually made his way to eminence in his profession, and in 1742 was appointed solicitor-general, about which time he also obtained a seat in parliament. After distinguishing himself as an advocate at Edinburgh in 1743, and as one of the managers of the impeachment of Lord Lovat in 1747, he succeeded Sir Dudley Ryder as attorney-general in 1754, and as chief-justice of the king's bench in 1756; soon after which he was created Baron Murray, of Mansfield. For a few months in 1757 he held the office of chancellor of the exchequer, and it was during that interval that he effected a coalition of parties which led to the administration of Pitt, afterwards Lord Chatham. The same year he declined the offer of the great seal, as he did twice afterwards. A change of parties in the cabinet in 1765, which introduced into office the marquis of Rockingham and his friends, for awhile threw Lord Mansfield into the ranks of the opposition, and the year 1770 was memorable for attacks on his character in a judicial capacity in both houses of parliament, which however led to no serious result.

On the trial of Woodfall for publishing "Junius's Letters," and on some other occasions, he showed himself the zealous supporter of government. In October 1776 he was advanced to the dignity of an earl of Great Britain. During the riots in London, in June 1780, his house was attacked by the anti-catholic mob, and his valuable collection of books and manuscripts fell a sacrifice to the fury of the multitude, by whom the mansion was burnt to the ground. He continued for some years longer to exercise his judicial functions. In 1788 he resigned his office of chief-justice, and the remainder of his life was spent in retirement, principally at his seat in Caen Wood, near Hampstead. He died March 20, 1793. As a politician Lord Mansfield was a favourer of high maxims of government in general; and in the law of libel he supported the opinion that the jury is the judge of the fact only and not of the law. He was, however, an enemy to violent exertion of power, as well as a friend to religious toleration. On various occasions he opposed vexatious prosecutions under intolerant laws, and voted in favour of the bill for the relief of the catholics. His ideas of legislation were on many points liberal. As an orator he displayed more of persuasive elegance than of boldness and force; but he might fairly have contested the palm of eloquence with any of his contemporaries except Lord Chatham. Lord Ashburton used to say that when he was wrong the faults of his reasoning were not easily detected, and when he was right he was irresistible.

MANSO, JOHN CASPAR FREDERIC, a learned German, who was born in the duchy of Gotha, in May 1759, and died June 1826, in Breslau, where he had been rector of the Mary Magdalen gymnasium. He wrote a good deal in prose and poetry, but his most important works are, "History of the Prussian State since the Peace of Hubertsburg," and "A History of the Ostrogothic Empire in Italy."

MANTEGNA, ANDREW, one of the most celebrated of the early painters, who was born at Padua

in 1431, where his master Squarcione was induced by the talents which he displayed to adopt him as a son. The youth employed himself principally in drawing from antiques, and at the age of sixteen painted a picture for the grand altar in the church of St. Sophia at Padua. Mantegna soon after entered the service of Lodovico Gonzaga at Mantua, where he opened a school. Here he painted his great picture, the Triumph of Julius Cæsar, for the exhibition of which a palace was erected in Mantua. It consists of several pictures, which have since been transferred to Hampton Court. Gonzaga conferred on him the honour of knighthood in reward for his merit. Innocent VIII. invited the artist to Rome to paint in the Belvedere, and he afterwards executed a number of capital works. One of the latest and best was the Madonna della Victoria, now in the Louvre at Paris, in which Giovanni Francesco Gonzaga is seen returning thanks for the victory gained by him over the forces of Charles VIII. in 1496. There are several other of his works in the Louvre, and an Annunciation in the Dresden gallery. He died at Mantua in 1506.

MANTON, THOMAS, an eminent nonconformist divine, who was born at Laurence Lydiard in Somersetshire in 1620, and educated at Oxford. Having entered holy orders, he received several church preferments, and was finally made chaplain to Cromwell. However, in 1660, Mr. Manton co-operated openly in the restoration of Charles II., who made him his chaplain. On the prohibition of the preaching of the nonconformists he was imprisoned, and after experiencing many painful vicissitudes he died in 1677. After his death his works were published in five large folio volumes.

MANUEL, JACQUES ANTOINE, one of the most eloquent and intrepid defenders of French liberty, who was born in 1775 at Barcelonnette, in the department of the Lower Alps, and was educated at the college of Nîmes. He entered as a volunteer in one of the battalions of the requisition in 1793, and rose to the rank of captain. After the peace of Campo Formio he quitted the army, studied law, was admitted to the bar at Aix, and soon acquired a high reputation for talent. In 1815 he was elected to the chamber of deputies which was convoked by Napoleon, and, after the abdication of that monarch, M. Manuel strenuously contended for the rights of the young Napoleon. He also moved a spirited protest against the force which was used by the allies to bring about the restoration of the Bourbons. This was of course an unpardonable crime, and an opportunity was found to display at least the disposition for punishing him. In 1815 he settled at Paris, and in the following year applied for admission to the Paris bar, that he might be entitled to plead in the courts. The council of discipline, as it is called, consulted the members of the bar at Aix as to their opinion of his character, in the hope of finding something against him; but, though their answer was favourable, the council refused to comply with his request. This refusal was repeated in 1816. In 1818 he was elected a member of the chamber of deputies by three departments, and became one of the most formidable opponents of the ministers, speaking extemporaneously with great facility—a talent possessed by few of the French deputies.

On the opening of the budget in 1819 he delivered a speech which produced a very lively sensation, and

was printed by order of the chamber. "Our political organization," said he, "is at once deficient in its municipal system, which is its natural basis; in the national guard, which must be our protection in peace, our defence in war; in the jury, without which the liberty of the press is an empty shadow; and in the responsibility of officers, which is the safeguard of all rights." In the ensuing sessions he continued in a series of bold and eloquent speeches to oppose the arbitrary measures which then characterized the policy of the French government. On the exclusion of Grégoire on the bills for suspending the liberty of person and of the press, on the laws of election, on the reform of the jury, the organization of the council of state, colonial legislation, public instruction, &c., he maintained the rights of the nation, and defended the charter in spite of the menaces, murmurs, interruptions, and calumnies of the royalist faction. Calm and immovable, yet fervid and ardent, his courage and eloquence were always victorious over the violence of his enemies. During the new elections in 1823 the greatest efforts were made to prevent his being chosen, and after the election a plan was formed for excluding him as unworthy of a seat. This being found impracticable, his enemies determined to effect his expulsion, and a pretext was found in his first speech of the session, on the question of the Spanish war. In the outset he was called to order; the president pronounced him in order; he was again interrupted by loud cries; he was accused of defending regicides; his expulsion was demanded; he was prevented from explaining or proceeding, and the president, unable to restore order, was obliged to adjourn the chamber. The next day, Labourdonnaye moved his expulsion; Manuel defended himself in an eloquent speech from the charge brought against him. The motion was sustained and referred to the 3rd of March; on that day Manuel protested against the power of the chamber to expel a representative of the nation, but his expulsion was voted by a majority. On the next day he again took his seat, and being required by the president to withdraw, replied that he should yield only to force. The session was then suspended for an hour, the members of the left side remaining in their seats. In this interval the hussier (sergeant at arms) read to him an order of the president requiring him to leave the hall; but his reply was as before, "I shall yield only to force." The hussier called in a detachment of the national guard, which refused to act; and a body of the gendarmerie was introduced. On being directed by the commanding officer to retire, he refused, and the order was issued to the gendarmes to arrest him. As they approached, he rose and expressed himself ready to follow them, the members present accompanying him. Manuel was again chosen to the chamber in 1824. He died in 1827, and was buried in the cemetery of Pere Lachaise, some obstacles which were interposed to the solemnization of his obsequies being surmounted by the firmness and prudence of his friends.

MANUTIUS, ALDUS, an Italian printer of the fifteenth and sixteenth centuries, who was also celebrated as an artist and a man of letters. He was born at Bassano in the Roman territory about 1447, and was educated at Rome and at Ferrara, where he learned Greek under Baptista Guarino. He became tutor to Alberto Pio, prince of Carpi, and in 1482 quitted Ferrara to reside with John Pico, prince of Mirandola. In 1488 he established himself as a printer at Venice,

but the first work which he finished was not published till 1494. In the course of the ensuing twenty years he printed the works of most of the ancient Latin and Greek authors extant, as well as many productions of his contemporaries, and some treatises of his own composition. Among the latter are, a Latin grammar, a Greek grammar, a tract on the metres of Horace, and a Greek dictionary. He was the inventor of the italic or cursive character, hence called Aldine, for the exclusive use of which for a term of years he obtained a patent from the pope and the senate of Venice. He established a kind of academy at his own house, and delivered lectures on classical literature, to the general study and improvement of which he greatly contributed. He died in April 1515, leaving four children by his wife, who was the daughter of Andrea d' Asola, a Venetian, in partnership with whom he carried on his typographical labours.

Manuzio Paolo, son of Manutius Aldus, was distinguished as a classic scholar no less than as a printer. He was born at Venice in 1512, and was brought up under the care of his maternal grandfather, from whom he received a learned education, and in 1533 reopened the printing-office which had for some time been closed, but did not carry on the establishment entirely on his own account till 1540. He opened an academy for the instruction of young persons in polite literature; and afterwards made a tour through the cities of Italy, for the purpose of examining the various libraries. After refusing several offers of professorships at Bologna and elsewhere, he was appointed to superintend the printing-office attached to a newly founded academy at Venice, where he continued till 1561, when he settled at Rome, on the invitation of Pope Pius IV. He was employed to conduct a press for printing the works of the fathers and other ecclesiastical authors; and at the same time kept up his establishment at Venice, whither he returned in 1570.

Pope Gregory XIII. induced him, by means of a pension, to take up his abode again at Rome, where he died in April 1574. He was the author of "Commentaries on the Writings of Cicero," a treatise "De Curia Romana," "Proverbs," "Letters," &c.

Manuzio Aldo, the younger, the son of the preceding, was also a printer. He was born in 1547, and was educated by his father, under whom he made an extraordinary progress in literature. In his eleventh year he produced "A Collection of Elegant Phrases in the Tuscan and Latin Languages;" and other juvenile publications attest his classical acquirements. On his father's removal to Rome, he carried on the printing establishment at Venice, where, in 1577, he was appointed professor of belles-lettres at the school of the Venetian chancery. In 1585 he succeeded Sigonius in the chair of rhetoric at Bologna, whence he removed to Pisa, to become professor of polite literature in 1587; and during his stay there he received the diploma of doctor of laws, and was admitted a member of the Florentine academy. In 1588 he went to Rome, and accepted a professorship which had been held by Muretus. He was much favoured by Pope Sixtus V., and Clement VIII. bestowed on him the office of superintendent of the Vatican press. He died in October 1597, and with him expired the glory of the Aldine press; the valuable library collected by himself and his predecessors was sold to liquidate his debts. He was the author

of many works, including "Commentaries on Cicero" and "Familiar Letters."

MANWOOD, JOHN, an eminent English writer, who lived in the reign of Elizabeth and James the First. His best work was entitled "A Treatise and Discourse of the Laws of the Forest." He was also the author of "A Project for Improving the Land Revenue, by Inclosing Waistes."

MANZONI, ALESSANDRO, an Italian tragic and lyric poet, of noble birth and elevated sentiments, who was born in Milan, and distinguished while young by his *versi sciolti* on the death of Imbonati, and at a later period created a new kind of lyrics in his "Inni." As a tragic writer he surpasses any living Italian poet. His tragedies are, "Il Conte di Carmagnola," Milan, 1820, and "Adelchi," 1822. In both of them he introduces the chorus. The subject of the first is from the Italian wars of the fifteenth century, and has received great applause in Germany (from Göthe) and England as well as in his own country. A later work is his "Betrothed"—"I Promessi Sposi, Storia Milanese del Secolo XVII.," 1827—which has introduced the historical romance into Italy. His "Opere," comprising his poems, tragedies, romances, and some miscellaneous prose writings, have been published in six volumes, 1829.

MAPLETOFT, JOHN, a learned medical writer who was born in Huntingdonshire in 1631, and educated at Cambridge. He was the author of several works of considerable merit, the principal of which is entitled "Observationes Medicæ circa Morborum Auctorum Historiam et Curationem."

In addition to his profession of M. D., he also possessed several valuable church preferments, which he held till his eightieth year, when he retired from active life. His death took place in 1721, eleven years after his retirement, when he had arrived at the advanced age of ninety-one.

MARA, GERTRUDE ELIZABETH, a celebrated musical singer and performer, who was born in Cassel about 1749. When she was seven years old she played the violin admirably, and in her tenth year she performed before the queen in London, whither she had accompanied her father, and where she remained two or three years. In her fourteenth year she appeared as a singer at court. In 1766 she went with her father to Leipsic, and received an appointment there. Frederic the Great, though much prejudiced against German performers, was induced to invite her, in 1770, to Potsdam, his residence, showed great admiration of her powers, and gave her an appointment immediately, with 3000 Prussian dollars salary. In 1774 she married a violincello player named Mara, a man of careless habits, who involved her in many difficulties, and she was dismissed by the king in 1780. In 1782 she went to Vienna and Paris, where she received the title of a first concert singer of the queen, and in 1784 she came to London, where she was received with the greatest enthusiasm. For thirteen evenings' performance at the Pantheon concert she received 1000 guineas. In 1785 and 1786 she was engaged for the opera, and appeared at one of the annual concerts, in honour of Handel, as first singer. But her obstinacy offended as much as her powers delighted. In 1808 she went to Moscow, where she is said to have married her companion Florio, after the death of Mara, from whom she had been separated long before. By the burning of Moscow she lost her house and fortune;

she therefore went to Reval and gave lessons in music. In 1819 she went through Berlin and came to London, and in 1821 returned to Esthonia. The fame of this singer was founded not only on the strength and fulness of her tone, and the extraordinary compass of her voice, which extended from *c* to the triple-marked *f* (nearly three octaves), but also on the admirable ease, quickness, and spirit, with which she sung the most difficult passages, and her simple and enchanting expression in the *adagio*. Her singing of Handel's airs, for instance, "I know that my Redeemer liveth," in the Messiah, was particularly celebrated. This lady died in 1833 at Reval, where she had resided for some time previous.

MARAT, JEAN PAUL.—The name of this Frenchman was odiously notorious in the most hateful times of the French revolution. He was born at Boudry, in Neufchatel, in 1744, and studied medicine at Paris, where he practised his profession at the beginning of the revolutionary movements. Previous to 1789 he had published several works on medical and scientific subjects, which display considerable acuteness and learning. Of a small and even diminutive stature, with the most hideous features, in which some traits of insanity were perceptible, his whole appearance was calculated to excite at once terror, pity, ridicule, and disgust. The first breath of the revolution converted the industrious and obscure doctor into an audacious demagogue, if not into a ferocious maniac. He began by haranguing the populace of one of the sections, but was treated with ridicule, and hustled by the crowd, who amused themselves with treading on his toes. Still he persisted, and finally succeeded, by his violence and energy, in commanding attention. Danton had just instituted the club of the Cordeliers, and collected around him all the fiercest spirits, and Marat among the number, who became the editor of the "Ami du Peuple," a journal which was the organ of that society, and soon became the oracle of the mob. As early as August 1789, he declared it necessary to hang up 800 of the deputies, with Mirabeau at their head, in the garden of the Tuileries, and, though he was denounced to the constitutional assembly, and proceeded against by the municipal authority of Paris, he contrived to escape, with the assistance of Danton, Legendre, and others, and by concealing himself in the most obscure corner of the city.

His journal, meanwhile, continued to appear regularly, was openly hawked about the streets, and assumed a more furious and atrocious tone, as he was inflamed by the prosecutions of the authorities, and encouraged by the increasing strength of his party. During the existence of the legislative assembly he continued his outrages, figured among the actors of the 10th of August and in the assassinations of September 1792. He was a member of the terrible committee of public safety, then formed, although without any official capacity, and signed the circular to the departments, recommending a similar massacre in each. Marat was chosen a member of the convention, and in spite of the contempt and abhorrence with which he was received in that body, particularly by the Girondists, who endeavoured at first to prevent his taking his seat, and afterwards to effect his expulsion, soon found encouragement to proceed with his sanguinary denunciations. The ministers, General Dumouriez, and the Girondists, whom he contemptuously called *hommes d'état*, were the objects

of his attack. Being charged in the convention with demanding in his journal 270,000 heads, he openly avowed and boasted of that demand, and declared that he should call for many more if those were not yielded to him. During the long struggle of the Mountain party and the Girondists his conduct was that of a maniac. The establishment of the revolutionary tribunal, and of the committee for arresting the suspected, was adopted on his motions, and, as president of the Jacobin club, he signed an address instigating the people to an insurrection and to massacre all traitors. Even the Mountain party denounced this measure, and Marat was delivered over to the revolutionary tribunal, which acquitted him; the people received him in triumph, covered him with civic wreaths, and conducted him to the hall of the convention. On the 13th of July, 1793, his bloody career was closed by assassination. Proclaimed the martyr of liberty, he received the honours of an apotheosis, and his remains were placed in the Pantheon.

MARATTI, CARLO, a clever painter and engraver, who was born at Camerino, in the marquisate of Ancona, in 1626, and while a child amused himself with painting all sorts of figures drawn by himself on the walls of his father's house. In his eleventh year he went to Rome, studied the works of Raphael, of the Caracci, and of Guido Reni, in the school of Sacchi, and formed himself on their style. His Madonnas were particularly admired. Louis XIV. employed him to paint his celebrated picture of Daphne, and Clement IX., whose portrait he painted, appointed him overseer of the Vatican gallery. He died at Rome in 1713. We are much indebted to him for the preservation of the works of Raphael in the Vatican, and of the Caracci in the Farnese palace. He also erected monuments to those masters in the church Della Rotonda. As an artist, Maratti deserves the title given him by Richardson, of the last painter of the Roman school. His design was correct, and, although he was not a creative genius, he showed himself a successful imitator of his great predecessors. His composition was good, his expression pleasing, his touch judicious, and his colouring agreeable. He was acquainted with history, architecture, and perspective, and used his knowledge skilfully in his pictures. Indeed the good taste which prevails in all his works is remarkable.

MARBOIS, FRANCOIS, marquis of Barbé Marbois, a French minister and diplomatist, who was born at Metz in 1745, where his father was director of the Mint. After finishing his education the young Marbois became tutor to the children of De Castries, minister of marine, through whose good offices he obtained a post in the French legation to the United States during our revolution. De la Luzerne was then the French minister in this country, but Marbois was the principal agent in the most important operations of the embassy. On the return of that minister to France, in 1784, M. Marbois continued in this country as *chargé de affaires*. He was afterwards appointed intendant or governor of St. Domingo, and, having returned to France in 1791, was immediately sent by Louis as his ambassador to the German diet. Marbois had hitherto taken no part in the revolutionary events, but in 1795 was chosen a member of the council of elders, and in the struggle between the directory and the councils, having defended the latter, he was, with a number of his colleagues, con-

demned to deportation to Cayenne. After remaining two years and a half in exile he received permission to return, and was nominated by the first consul counsellor of state, and in 1801 secretary of the treasury, which was erected into a ministry. In consequence of some unsuccessful operations he was removed in 1806, but was made grand officer of the legion of honour and count of the empire. In 1808 he was made president of the *cour des comptes*, and was now a declared admirer of the emperor. In 1813 his expressions of devotion to the imperial government had introduced him into the senate, and in the following year his name was found among the first to vote for the deposition of Napoleon. Louis XVIII. created him peer of France, and confirmed him in the presidency of the *cour des comptes*. During the hundred days Napoleon refused to see a man whom he accused of ingratitude. In 1815 the second restoration conferred on him the dignity of keeper of the seals. Although M. Barbé Marbois defended the erection of the prevotal courts, he was not willing to go the whole length of the ultra-royalism of the period, and in 1816 was obliged to surrender his portfolio, and was soon after created marquis. Among his works, besides some agricultural essays, and some productions in polite literature, we may mention his "Essai sur les Finances de St. Dominique," "Essai de Morale," "Complot d'Arnold," and his "Histoire de la Louisiane et de la Cession de cette Colonie."

MARCELLO, BENEDETTO, a noble Venetian, who was born in 1686, and while a youth became a great proficient in the science of music, in consequence, it is said, of a reflection thrown upon his deficiency in that respect at a concert given by his brother Alessandro, which hurt his pride and stimulated him to exertion. He afterwards studied under Gasparini, and, receiving a liberal education, distinguished himself as a poet as well as a musician. In 1716 a *serenata* of his composition was performed at the celebration of the birth of the first son of the emperor Charles VII., and excited great applause. Eight years after appeared the first four volumes of his adaptation to music of Giustinian's "Paraphrase of the Psalms," which he afterwards completed in eight more, the whole being published in 1726. Garth of Durham has adapted suitable words from the English translation of the Psalms to Marcello's music, with a view to their being performed as anthems in the cathedrals, with great success. This elaborate work was printed by subscription in eight folio volumes. Marcello was successively a member of the council of forty, provveditore of Pola, and chamberlain of Brescia, in which city he died in 1739.

MARCELLUS, M. CLAUDIUS.—The first Roman general who successfully encountered Hannibal in the second Punic war. During his consulship he had given the greatest proofs of his valour in a single combat with Viridomarus, a Gallic chief, whom he slew; the Gauls, discouraged by the loss of their leader, fled before an inferior Roman force. The result of this victory was the complete conquest of Upper Italy. Marcellus received the honour of a triumph, as the decree of the senate expressed it, for his victory over the Insubri and Germans. This is the first time that the Germans are mentioned in the Roman history, and the last mention we have of a personal contest between generals. Soon after this

the second Punic war broke out, and after the fatal battle of Cannæ he was sent against Hannibal; and as prætor took the command of the troops remaining at Canusium in the room of Terentius Varro. On receiving information of Hannibal's march to Nola, he hastened to anticipate him, threw himself into the city, and forced the Carthaginians to retreat with great loss. Hannibal made a second attack upon Nola, and as the place was untenable, Marcellus resolved to risk a general engagement on the open plain. His army was inferior in point of numbers, but had the advantage of longer spears. After a hard-fought battle, Hannibal was driven to his camp. Marcellus was now chosen consul, with the celebrated Fabius Maximus Cunctator for his colleague. He frustrated a third attempt of Hannibal to regain the city of Nola, and again offered him battle, which the latter declined. His activity was interrupted for a time by disease, but he afterwards went to his province of Sicily, where the siege of Syracuse was his most remarkable achievement. After having used every means to capture by force that city, which was defended by the mechanical ingenuity of Archimedes, he limited himself to a blockade, and frustrated all the efforts of the Carthaginians to relieve it, and succeeded, partly by artifice and partly by force, in making himself master of the place. The city was surrendered unconditionally, and he was unable to save it from pillage, but he gave orders that no Syracusan should be put to death. Many of the inhabitants, however, and among them Archimedes were killed in the heat of victory. Marcellus was filled with regret on account of the death of Archimedes, granted many privileges to his connexions, and caused him to be buried with much pomp.

After having reduced the greater part of the island, and gained a complete victory over the Carthaginians, he returned to Rome, and received the honour of an ovation. He was again made consul B. C. 211, with M. Valerius Lavinius, and again received the command in Sicily. But the Syracusans sent ambassadors to Rome to complain of his cruelty, and pray for another general. Marcellus was acquitted, but he voluntarily exchanged provinces and remained in Italy. The Syracusans afterwards repented of their conduct, and entreated his forgiveness. He pardoned them, and procured them the restoration of their former privileges, and the honour of being considered as allies of Rome. As a mark of gratitude, they declared themselves the clients of the Marcellian family. In the mean time Marcellus carried on the war against Hannibal in Italy, and fought an undecisive battle at Numistrum. In the succeeding year he was defeated by Hannibal at Canusium; but, having rallied the fugitives and inspired them with fresh courage, he renewed the contest on the following day, and gained the victory, though with a heavy loss. B. C. 209, he was chosen consul the fifth time, with T. Quintius Crispinus. The two consuls united their forces on the Liris, but Hannibal avoided giving battle. The Romans, preparing to encamp upon a neighbouring hill, were suddenly surrounded; they would, however, have been able to cut their way through, had not the Etrurians, who composed the largest part of the cavalry, immediately surrendered. Marcellus himself fell; his son and the other consul escaped. Thus died this great general, who made himself formidable to Hannibal himself. He was called the sword, as Fabius was the shield, of Rome.

BIOGRAPHY.—VOL. II.

Hannibal took the ring from his finger, and caused the body to be burnt with the most distinguished honours, and sent the ashes to his son in a costly urn. His family continued to flourish, and furnished many consuls, until it became extinct with the son of Octavia, the sister of Augustus, whom Virgil has immortalized.

MAR CET, ALEXANDER, a learned chemist and natural philosopher, who was born at Geneva in 1770, and took his degree at the university of Edinburgh. He then settled in London, where he rose to great eminence as a physician. In 1814 he returned to his native country, where he was received with great distinction. He then determined to fix his residence at Geneva, but returned to London to settle his affairs, and died there on the 19th of October, 1822. His best work is "An Essay on the Chemical History of Calculi."

MARCHESI, LUIGI, called also Marchesini, a celebrated singer, born at Milan about 1755. While a youth, having attracted the attention of some cognoscenti, he was encouraged by them to quit his father's house privately, went to Bergamo, and there subjected himself to the necessary mutilation. After completing his studies in Munich, he returned to his native country, where he was received with the greatest admiration and enthusiasm. The academy at Pisa caused a medal to be struck in his honour; he afterwards sung in Rome, Vienna, Petersburg, Berlin, and in 1788 came to London, where the directors of the Italian opera gave him 1,500*l.* for one winter, with a benefit and his expenses. Marchesi was not less remarkable for the beauty of his person, and his grace and propriety of gesture, than for his voice. He sang in Vienna in 1801, but the time of his death is unknown.

MARGARET.—This celebrated queen of Denmark, Norway, and Sweden, justly called the Northern Semiramis, was the daughter of Waldemar III., king of Denmark. She was born at Copenhagen in 1353, and married to Haquin or Hacon, king of Norway, in 1363. The talents, firmness, and beauty of the princess rendered her popular among her countrymen, and, on the death of her father, she succeeded in placing her son Olaus on the throne of Denmark. The death of her husband in 1380 put the government of Norway in her hands, and the plan of uniting the three kingdoms, which was favoured by the imbecility of the Swedish monarch, seems now to have occupied the mind of this princess. Olaus died in 1387, and Margaret by her address caused herself to be declared queen. Taking advantage of the domestic dissensions in Sweden, and flattering the nobles with the prospect of greater power, she raised a party in that country who recognized her as queen; and having defeated the troops of Albert, the Swedish king, at Falköping, she soon obtained possession of the throne. Looking forward to a permanent union of the three crowns, she endeavoured to effect her purpose by the celebrated act of union, or treaty of Calmar, which took place in 1397. She restored tranquillity at home, and was successful against the foreign enemies of her kingdom, but her peace was disturbed by the ingratitude of Eric, whom she had nominated her successor. She died in 1412, after having, by her prudence, energy, address, and foresight, raised herself to a degree of power and grandeur then unequalled in Europe from the time of Charlemagne.

X

**MARGARET OF ANJOU** was the daughter of Regnier, or René the Good, titular king of Sicily. This beautiful but unfortunate princess was married in 1443 to the imbecile Henry VI. of England. By the marriage articles Maine was given up to her uncle, Charles of Anjou, and this cession facilitated the conquest of Normandy by the French. The loss of this important province was attributed to Margaret, and the house of commons accused Suffolk, the author of her marriage and the favourite minister of the queen, of high treason. He was banished the kingdom. Soon after the sentence, and without having quitted the country, he was murdered. In the war of the roses, which soon began to desolate England, Margaret played a conspicuous and important part. The bold, active, and even fierce temper of this princess, contrasted singularly with the feeble character of her husband. She was for a long time the life of the Lancastrian party. She defeated the duke of York, and, placing a paper crown on his head, exposed him at the gates of the city of York. In 1461 the princess defeated Warwick at St. Alban's, and her victories were always stained with numerous executions. The son of the late duke of York, the gallant young Edward, soon appeared at the head of the Yorkists, who now became victorious. Margaret's army was annihilated at Towton, and Edward was declared king. The unhappy queen succeeded in obtaining assistance from Louis XI. of France, but was again defeated, and compelled to flee. After concealing herself in the wildest parts of the country, where she was often compelled to suffer the greatest privations, and even endured the greatest indignities from the lawless bands with which the distracted kingdom was then infested, the queen finally took refuge in France. It was not long before Warwick became embroiled with the young king, and determined to replace Henry on the throne. Edward was in turn obliged to escape to the continent, but, having obtained assistance from the duke of Burgundy, re-appeared in England after a few months, and defeated Warwick at Barnet on the very day that Margaret landed in England with her son then eighteen years of age. On hearing of the defeat and death of her champion, the courage of Margaret seemed for once to forsake her, and she took refuge in the monastery of Beaulieu; but her undaunted and masculine spirit again led her to the field: having collected her partisans, the hostile forces met at Tewkesbury, and the Lancastrians were totally defeated. Her son was carried before the king. "How dare you," said Edward, "enter my realm with banner flying?" "To recover my father's kingdom," answered the prince, with the spirit of his mother, "and heritage from his father and grandfather to him, and from him to me lineally descended." Edward pushed him back, and the lords despatched him. Henry soon after died, if he was not murdered, in the Tower, and Margaret remained in prison four years. Louis XI. ransomed her for 50,000 crowns, and in 1482 she died, "the most unhappy queen, wife, and mother," says Voltaire, "in Europe." Her courage, her sufferings, and her crimes have been delineated with historic truth and poetic beauty by the genius of Shakspeare.

**MARGARET OF AUSTRIA.**—This princess was the daughter of the emperor Maximilian I. She was born in 1480, and sent to France after the death of her mother, Mary of Burgundy, to be educated at

the court of Louis XI., to whose son, afterwards Charles VIII., she was affianced. Charles, however, having married Anna, heiress of Brittany, she was sent back to her father's court, and was married in 1497 to John, infant of Spain. On the voyage to Spain a terrible storm threatened the destruction of the ship. In the midst of the danger, while the rest of the company were at their prayers, she is said to have composed her epitaph in the following words:

*Cy-gît Margot, la gente demoiselle,  
Deux fois mariée et morte pucelle.*

She arrived in safety, but on the 4th of October, 1497, the infant died. In 1501 she was married to Philibert II., duke of Savoy, who died in 1504. Her father then named her governess of the Netherlands, where her administration was distinguished by prudence and vigour. She died in 1530. Jean le Maire collected her addresses before the court and the estates, in the "*Couronne Margaritique*," which contains also many poems, and her "*Discours de sa Vie et de ses Infortunes*." Fontenelle has made her a speaker in one of his witty "*Dialogues of the Dead*."

**MARGARET OF VALOIS**, was queen of Navarre and sister to Francis I. She was born at Angoulême in 1492. She was brought up at the court of Louis XII., and married the duke of Alençon in 1509, became a widow in 1525, and in 1527 was espoused to Henry D'Albret, king of Navarre. She joined with her husband in every effort to make their small kingdom flourish, by encouraging agriculture and the useful arts, and by improving knowledge and civilization. She was fond of reading, and had been led by curiosity to make herself acquainted with the principles of the reformers, to which she became partially a convert, and not only afforded protection to reformed divines, but used her influence with her brother Francis to the same purpose. She also read the Bible in the French translation, and formed mysteries for representation from the New Testament, which she caused to be performed at court. She wrote a work entitled "*Le Miroir de l'Âme Pécheresse*," printed in 1533, which incurred the censure of the Sorbonne. She underwent some ill treatment from her husband on this account, and might have suffered more, but for the interposition of her brother, Francis I., who was much attached to her, and in complaisance to whom she, externally at least, became more strict in her attention to the ceremonials of the ancient religion. It will appear extraordinary in the present day, that a princess so contemplative and pious as Margaret of Valois should be author of a book of tales as free in their tendency as those of Boccaccio. Such is "*Heptameron, ou sept Journées de la Reyne de Navarre*," which was written during the gayety of youth, but not printed until after her death. She died in 1549, leaving one child, Joan d'Albret, afterwards mother of Henry IV. In 1557 a collection of her poems and other pieces was printed, under the title of "*Marguerites de la Marguerite des Princesses*."

**MARGARET**, called Madame de Parma, duchess of Parma. This lady was born in 1522, and was the natural daughter of Charles V. and Margaret of Gent. She was married first to Alexander of Medici, and afterwards to Octavia Farnese, duke of Parma and Piacenza. Philip II. of Spain appointed her to the government of the Netherlands in 1559, where she acted, under the advice of Granvella, with considerable prudence, and perhaps might have restored

quiet had not the king sent the duke of Alva to aid her in suppressing the disaffection. Alva brought such powers that nothing but the title of sovereign was left to Margaret, who returned indignantly to Italy to her husband, and died at Ortona in 1586. Her son was the celebrated Alexander Farnese, duke of Parma.

MARGARET OF FRANCE, queen of Navarre, wife of Henry IV., and daughter of Henry II., was born in 1552, and was one of the greatest beauties of her age. Her talents and accomplishments corresponded to the charms of her person. She was married to Henry, then prince of Béarn, in 1572, but the duke of Guise was known to be the object of her affections, and, notwithstanding her brilliant beauty, she never possessed the heart of her husband. The gallantries of Henry, which he never pretended to conceal from his wife, could not excuse nor authorise, but doubtless contributed to increase, her own irregularities. On the escape of Henry from Paris, she demanded permission of Henry III. to follow him, but was not for a long time allowed to depart. After living several years with the king of Navarre, she returned to Paris, on account of some disgust at the restraints placed on the exercise of the catholic religion, and while there was guilty of the greatest licentiousness. Rejected at once from the court of Navarre and that of Paris, she maintained herself in the Agenois in open defiance of her husband and brother. On the accession of the former to the throne of France, he proposed to dissolve their marriage, to which she consented, on condition of receiving a suitable pension and having her debts paid. In 1605 Margaret returned to Paris, where she lived in great splendour, retaining her beauty, wit, and habits of dissipation, and died in 1615 at the age of sixty-three. The house of Margaret was frequented by the wits of the day, and she knew how to unite excessive indulgence in pleasure with attention to study.

MARIA LOUISA, queen of Spain.—This princess was the daughter of Philip duke of Parma, and married to Charles IV. against his wishes, but in obedience to the express commands of his father, in 1765. Maria was prudent, not without address, and much superior to her husband in understanding. She soon overcame the violent temper of Charles, which at first broke out into acts of personal outrage, and so far prevailed over the formality of the Spanish court as to have unrestricted access to the king. Every thing was submitted to her approval. For her favourites she took care to secure the favour of the king previously to avowing her own inclinations, and thus had the merit of appearing to yield to the wishes of her husband. Even while princess of Austria, an intrigue with the elder Godoy was only terminated by his banishment from Madrid. His place was supplied by his younger brother, Don Manuel Godoy, who became equally the favourite of Charles. Their intrigues led to the affair of the Escorial, in which Maria acted a most unnatural part against her son. In 1808 the revolution of Aranjuez took place, Charles abdicated, and Maria threw herself into the arms of the French. Charles was obliged to retract his abdication, and that celebrated correspondence with Murat followed in which Maria Louisa, in a letter written with her own hand, accuses her son of hardheartedness, cruelty, and want of affection for his parents. After the well-known proceedings at Bayonne, Maria Louisa remained in France a short

time with Godoy and the ex-king, and finally went to Rome, where she died in 1819.

MARIA LOUISA, LEOPOLDINE CAROLINE, archduchess of Austria, duchess of Parma, was the eldest daughter of the emperor Francis I. by his second marriage with Maria Theresa, daughter of Ferdinand, king of Naples. She was born in 1791, and married to the emperor Napoleon at Paris on the 1st of April, 1810. This connexion seemed to confirm the peace of the continent. Napoleon conducted his bride in a kind of triumph through the provinces of his empire; and on the 20th of March, 1811, Maria Louisa became the mother of a son. The court of the empress was now more brilliant than ever. The next year Maria Louisa accompanied her husband to Dresden, and visited, in company with her imperial parents, her former home. After this she returned to Paris; and previous to setting out for his final struggle Napoleon appointed her regent of the empire, with many limitations. In March 1814 she was obliged to leave Paris with her son, and in April retired to Blois by the command of her husband after Napoleon abdicated his authority. She then went to Orleans, and, attended by Prince Esterhazy, proceeded to Rambouillet, where she had an interview with her father at Petit Trianon, which decided her fate. She was not permitted to follow her husband. In May she passed through Switzerland with her son to Schönbrunn; and on the 17th of March, 1816, she entered upon the administration of the duchies of Parma, Piacenza, and Guastalla, secured to her by the treaty of Fontainebleau. In May 1816 she declared herself grandmistress of the Constantine order of St. George, which she had established. As Spain refused to accede to the acts of the congress of Vienna, it was agreed at Paris in June 1817, between Austria, Russia, France, Spain, England, and Prussia, that the duchies of Parma, Piacenza, and Guastalla, on the death of the archduchess Maria Louisa, who no longer bore the title of empress but that of "your majesty," should revert to the infanta Maria Louisa, formerly queen of Etruria, then princess of Lucca, and her male heirs, and that Lucca should then be annexed to Tuscany. Austria, however, retained the Parmesan district, surrounded by the kingdom of Lombardy, on the left bank of the Po, and the right of maintaining a garrison in Piacenza. The son of Napoleon and Maria Louisa, formerly hereditary prince of Parma, was no longer called Napoleon in the state calendar, but Francis Charles Joseph. By the treaty above mentioned, on the death of his mother, and the reversion of Parma to the house of Bourbon, he was, had he lived, to have received the appanage of Ferdinand grand-duke of Tuscany, in Bohemia. In 1818 the emperor Francis conferred upon the prince, his grandson, the title of duke of Reichstadt. When his father returned from Elba to Paris in 1815 a plan was formed for carrying off the young prince from Schönbrunn, where he was under the care of the countess Montesquiou, who had accompanied him from France. The empress Maria Louisa had also received letters from her husband, inviting her to come, with her son, to France; but his letters were not answered. The design of carrying off the prince conceived by the son of the countess Montesquiou, was discovered at the moment of its execution. The prince was transferred to Vienna, and placed under the inspection of Germans till his death.

MARIANA, JUAN, or JOHN, a Spanish historian, who was born at Talavera in 1536. He devoted himself to the clerical profession, and entered the society of the Jesuits; and it was at the university of Alcalá he acquired that pure taste and that eloquence which are found in his writings. He then journeyed, and taught theology with distinction in Rome, Sicily, and Paris. The climate of the latter city however, and still more his indefatigable industry, undermined his health, so that he returned in 1574 into the Jesuits' college at Toledo. He now wrote his "*Historia de Rebus Hispaniæ*" in elegant Latin, that the great deeds of his countrymen might become known to all nations. His tone is impartial, though he ardently loves Spain and admires Spanish virtue. Though a Jesuit he complains of Pope Alexander VI., and says that he caused Cæsar to leave the clerical order *contra fas, contra auspicia, contra omnia æquitatis jura*. Though a Spaniard he is not blindly prejudiced for his king. He describes with sorrow the conquest of Naples; and his censure of Ferdinand is moderated only by considering his good qualities as personal, his bad ones as common to all princes. His style is elegant, and often beautiful and concise. The great success of Mariana's work, and the fear of seeing it badly translated, induced the author to translate it into the Castilian idiom himself, with those improvements which the progress of years had suggested to him. Four editions of the translation appeared during his lifetime, each with corrections and additions. An English translation was made by Captain Stephens, the continuator of "*Dugdale's Monasticon*." Mariana's best works are, his essay "*De Rege et Regis Institutione*," which exposed the author to much inconvenience, and eleven years after its publication was condemned to be burned by the parliament of Paris as a revolutionary work, because it maintains that it is permitted to make away with a tyrant; "*De Ponderibus et Mensuris*," and seven essays, appeared together in a folio volume at Cologne. Mariana dedicated his last years to his *scholia* on the Old and New Testament, the completion of which his infirmities prevented; yet he caused them to be printed in 1619 at Madrid. He died in 1623 at Toledo.

MARIEPTE, PIERRE JEAN, an engraver, who was born at Paris in 1694, was instructed by his father in the art of engraving, and, by his travels in Germany and Italy, rendered himself familiar with the fine arts. In 1750 he purchased the post of royal secretary and controleur of the chancery, and devoted himself entirely to his collection of engravings. His works are, "*Traité du Cabinet du Roi*," "*Lettres à M. de Caylus*," "*Lettres sur la Fontaine de la Rue de Grenelle*," "*Architecture Française*," "*Descriptions of D'Aguilles's and Crozat's Collections*," &c. His taste and learning procured him the friendship of Caylus, Barthelemy, and Laborde, by whom he was entrusted with the supervision of the "*Recueil des Peintures Antiques*," from drawings by Pietro Santo Bartoli.

MARINI, or MARINO, GIAMBATTISTA, stands at the head of a school of Italian poets. He was born in 1569 at Naples. Against the wish of his father, who intended him for the study of the law, he followed his inclination for poetry. The duke of Borino took him into his palace, and the prince of Conca, high admiral of the kingdom, into his service. Here he became acquainted with Torquato

Tasso, and in intercourse with him his powers were developed. At a later period he found a patron in the cardinal Pietro Aldobrandini at Rome, with whom he went to Turin, where a flattering poem on the duke of Savoy, entitled "*Il Ritratto*," procured him a kind reception, an order, the title of the duke's secretary, &c. The envy of his enemies, and his satirical humour, involved him in various disputes. Margaret, the divorced wife of Henry IV., had invited him to Paris, and after her death Maria de' Medici became his patroness there. He showed his gratitude in a poem, "*Il Tempio*," for which new rewards were bestowed upon him. Towards the end of 1622 he returned to Italy, was elected president of the *Accademia degli Umoresti* at Rome, and after some time proceeded to his native place. Here he chose the incomparably beautiful Posilippo for his residence, and hoped to enjoy the fortune he had acquired, but death removed him in 1625. Marini's most celebrated work, the epic "*Adone*," was first published in Paris in 1623, and has been equally praised and blamed both for its plan and execution. The voluptuousness of many passages has placed it among the prohibited books. The other works of Marini are a narrative poem, "*La Strage degli Innocenti*," and a great collection of miscellaneous poems published at various times under the titles of "*La Lira*," and "*La Zampogna*;" also "*Lettere Grave, Argute, Facete*," and other compositions in prose and verse. Some of his sonnets are among the most perfect in the Italian language. He who has read Marini—and there are many who condemn him without having done this—will readily admit that nature endowed him with the gifts of a poet, but ambition made him fail. He was jealous of the laurels of Ariosto and Tasso, and strove after a new distinction, attempted to penetrate deeper into the recesses of the human heart, to enhance the beauty of the beautiful, and to give new zest to voluptuous description; hence the undue freedom of his colouring; hence his far-fetched metaphors and forced conceits; yet, in spite of these, talent, wit, and the power of imparting new charms to common things, cannot be denied him; but the faults of the master became insupportable in his followers, who could imitate indeed his conceits, but could not redeem them by flashes of genius.

MARION, FRANCIS, a distinguished American officer in the revolutionary war, who was born near Georgetown, South Carolina, in the year 1733. He was engaged in agricultural pursuits until the year 1759, when he became a soldier, and served with credit against the Cherokee Indians. As soon as the war between the mother country and the colonies broke out he was called to the command of a company in his native state. In 1776 he co-operated bravely in the defence of Fort Moultrie, and soon reached the rank of lieutenant-colonel, commandant of a regiment, in which capacity he acted during the siege of Charleston. He became subsequently, as brigadier-general in the militia of South Carolina, an indefatigable and most useful partisan. The country from Camden to the sea-coast, between the Pedee and Santee rivers, was the scene of his operations. Many very striking and characteristic anecdotes of his prowess and habits are related in the life of him written by Colonel Hovy, and in Garden's "*Anecdotes of the Revolutionary War*." It is stated that, in addition to his distinction in partisan warfare,

General Marion acquired much reputation by the assistance which he bestowed in conducting the sieges of the captured posts held by the British. At Georgetown, Fort Watson, Fort Moste, Granby, Parker's Ferry, and at Eutaw he highly distinguished himself. He died in February 1795, leaving an excellent personal as well as a high military character.

MARIUS, CAIUS, a Roman born in the territory of the Volsci. With strength of body he united much understanding, firmness of purpose, and a spirit of enterprise. His character was rough, ambitious, and unyielding. Marius devoted himself to a military career, and gave the first proofs of his courage at Numantia under Scipio Africanus. His merits successively raised him through the different ranks, and Scipio foresaw in him a great general. During the consulship of Cæcilius Metellus and L. Aurelius Cotta he was made tribune by the influence of the former, when, in order to check the abuses at the comitia, he proposed the law making the entrance to the place of voting narrower, so as to protect the citizens from the solicitations of the candidates and their friends. The patricians, indignant at a law so injurious to their influence, demanded of Marius an explanation of his motives. The two consuls declared against him, but Marius threatened them with the weight of his tribunitian authority; and, without regard to his obligations to Metellus, ordered the licitor to conduct the consul to prison. His firmness triumphed, and gained him the favour of the people. He afterwards modified the law proposed by Gracchus for the division of corn among the poor citizens so as to spare the public treasury. He then stood candidate for the edileship, but without success. He was, however, appointed pretor. Having been charged with procuring his election by bribery, he was acquitted, and discharged the duties of his office to general satisfaction, supplying the deficiencies of his education by the natural strength of his understanding. The office of pro-pretor of Spain, which was conferred on him the following year, he discharged with great reputation. He delivered the country from robbers, and endeavoured to civilize the yet savage natives. On his return he again devoted himself to political affairs; and by his marriage with Julia, the aunt of Julius Cæsar, connected himself with the illustrious Julian family.

A wider career was now open to him. He accompanied the consul, Q. Cæcilius Metellus, as his lieutenant to the Jugurthine war. His courage and his patience in hardships, in which he placed himself on a level with the meanest soldier, gained for him the esteem of Metellus and the love of the army. But Marius was so ungrateful as to vilify the man who had raised him from obscurity in order to rise by his fall. At length Marius asked permission of Metellus to return to Rome, in order to seek for the consulship. Metellus, not without ridicule, refused his request, but Marius continued his importunity till he obtained his object, a few days before the election of the consuls. In six days he hastened to Rome, and, by calumnies against Metellus and the most extravagant promises, he gained over the minds of the people so completely that he was chosen unanimously; and although Metellus had been appointed pro-consul of Numidia for the third time, he obtained the command in that province. L. Cassius Longinus was his colleague in the consulship. As Marius perceived that his plebeian origin would never per-

mit him to gain the support of the patricians, and that he could expect nothing but from a powerful party among the common people, he declared himself the enemy of the nobles. In proportion to the violence with which he attacked the nobility in his public speeches was the favour of the populace. As the rich refused to enrol themselves in his legions, in order to complete the number he had recourse to the lowest class of citizens, who had previously been employed only in cases of the most pressing necessity, and taught the Roman people to enrich themselves by the service, and with the speed of lightning he appeared in Utica, and began the campaign.

In the mean time Jugurtha had found an ally in Bocchus, king of Mauritania. Two armies opposed the Romans, and Marius avoided a general engagement, till he was forced to yield to the impatience of his men. He then directed his march through the deserts of Numidia to Capsa, the capital of the country, which he stormed and destroyed. Terrified by this cruel example every place which he approached surrendered. While Marius was prosecuting the war, L. Cornelius Sylla, the questor, arrived with a reinforcement of cavalry, and by his courage, his perseverance against obstacles, and his austere manner of living, gained the friendship of his commander. After the capture of Mulucha, Marius led his troops back to the sea-coast in order to place them in winter quarters. On this march Bocchus and Jugurtha attacked him, and surrounded him in his intrenchments. The Romans seemed to be lost; but during the night Marius fell upon the enemy, exhausted with dancing and revelry, and almost entirely destroyed them. After this defeat Bocchus made his peace with the Romans, and was persuaded by Sylla to betray Jugurtha to them. Marius divided a part of Jugurtha's territory between Bocchus and Hiempsal II., or Mandrestal, and made the remainder a Roman province. Before his return to the capital he received the unexpected information that he was chosen consul the second time. The people, terrified by the approach of the Cimbri and Teutones, had chosen him contrary to the laws. Marius received in Rome the honour of a triumph. He then marched over the Alps to Gaul, while C. Fulvius Fimbria, his colleague, went to Upper Italy. The Cimbri and Teutones, instead of passing into Italy, had invaded Spain, and thus given Marius an opportunity to discipline his army. As the terror of the Cimbri was unabated he was made consul a third and fourth time in succession. The barbarians at length returned from Spain, and threatened to invade Italy from two sides. Marius stationed his army at the confluence of the Rhone and the Iser, while his colleague Lutatius Catulus was to take his position at the foot of the Norican Alps. As it was impossible for ships to enter the mouths of the Rhone, he constructed a canal, the Fossa Mariana, uniting the waters of the Rhone with the Mediterranean, to supply the army with provisions from the sea. This work was scarcely finished when the Teutones, with the Ambrones, pitched their camps opposite to the Romans. Marius hesitated to meet in the open field so superior a force; and by cutting off their means of subsistence he hoped, if not to destroy, at least to weaken them. But the barbarians determined to continue their course without regard to the Roman army. He first attacked the Ambrones, and on the next day the Teutones, and destroyed both armies. On the report

of this victory messengers were sent from Rome to inform him that he was appointed for the fifth time to the consulship, and that the honour of a second triumph was decreed him. The latter, however, he would not accept until he had made himself worthy of it by the defeat of the Cimbri. These barbarians had entered Italy on the east; Marius united his forces with those of Lutatius, and marched against them. They then sent an embassy requesting a grant of territory in which they might reside, but Marius scornfully announced to them the total destruction of their allies. Exasperated by this news the Cimbri advanced to meet him. Bojorix, their king, called upon Marius to fix upon a time and place for a decisive engagement. He selected a plain called *Campi Raudii*, not far from Vercelli, which would not allow the Cimbrian army to avail themselves fully of their superiority of numbers. The Roman army was 52,000 strong. Marius reserved to himself the chief attack, but the battle was decided by Lutatius and Sylla. The defeat of the barbarians was complete; 150,000 fell, 60,000 surrendered, and the remainder perished a voluntary death to slavery.

Marius and Lutatius entered the city in triumph, and the victorious general was appointed consul for the sixth time, although the noble Metellus Numidicus was his rival. He now entered into a combination with the tribunes of the preceding year—Apuleius Saturninus and the pretor Servilius Glaucia, and in connexion with them employed every means to gain the people and deprive the patricians of their privileges. This was effected chiefly by the law that every order of the people should be confirmed by the senate within five days after its promulgation. The senators were compelled to swear obedience to this law, and Metellus refusing to do it, was punished with exile. In the meantime Marius had become an object of suspicion to both parties by his ambiguous conduct, and on the next consular election he was not rechosen. Chagrined at the recall of his enemy, Metellus, Marius went to Asia, under pretence of performing a vow to Cybele, but in reality to gain new importance by kindling a new war. On his return he was astonished to find himself almost entirely forgotten, and Sylla the favourite of the people. His hatred was excited, and a civil war would have been the consequence if the consuls had not checked it in its commencement. Soon after this the social war broke out. Marius gained a few victories in an inferior command, but acquired less reputation than might have been anticipated. His strength was broken by age and sickness, and in the midst of the war he resigned his office. This dangerous contest was hardly closed when the civil war broke out between Marius and Sylla. They were both candidates for the command against Mithridates. The consuls favoured Sylla, but P. Sulpitius, tribune of the people, who favoured Marius, attacked them sword in hand, and drove Sylla from Rome. Marius received the chief command; but the army marched to Rome under his rival, where Marius was committing the greatest violences against the friends of Sylla. Sylla entered the city without resistance. Marius and his son fled and were proscribed.

Separated from his son, Marius wandered about on the coasts of Italy, and, after escaping several times the pursuit of his enemies, was found by some horsemen in a marsh. He was conducted naked to Minturnæ, where the magistrate after some deliberation

resolved to obey the orders of the senate and of Sylla. But the Cimbrian slave, to whom the execution was entrusted, awed by the look and words of Marius, dropped his sword, and the people of Minturnæ, moved with compassion, conducted him to the coast, whence a vessel conveyed him to Africa. He landed amid the ruins of Carthage, and joined his son, who had sought assistance in Numidia in vain. They spent the winter together in the island Cercina. When they received information that their party had once more triumphed in Italy by means of Cinna, Marius hastened to return. He declined the honours offered him, and united himself with Cinna and Sertorius. They resolved to attack the city, which was defended by Octavius. Provisions and soldiers failing in the city, the senate offered to throw open the gates on condition that no Roman should be put to death without trial. This was granted. Marius was at first unwilling to enter the city till the act of proscription against him was repealed. But while the citizens were assembled to rescind the act he entered with his infuriated followers, and, in violation of the conditions, a dreadful massacre took place, to which Sertorius and Cinna finally put an end. He had given orders for the death of every one whose salutation he did not return. Almost all the senators, who were opposed to the popular party, were put to death, and their estates confiscated. When the term of Cinna's consulship was completed he declared himself and Marius consuls. Marius was now seventy years of age, and enjoyed this dignity for the seventh time; but seventeen days after he died, exhausted by his preceding sufferings, and by the anxiety which the threats of Sylla occasioned.

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE, a novelist and dramatic writer, who was born at Paris in 1688, and was led by his inclinations to write for the theatre. Thinking that nothing new was to be done in the way of character pieces, Marivaux wrote comedies of intrigue. He was not without delicacy, but it was connected with a certain littleness. His characters want life, his plots variety. The development of the intrigue is so simple that the *denouement* is discoverable from the beginning. He is so far-fetched and affected that the French have given his name to a conceit and affectation of manner or expression, *marivaudage*. At the time of their appearance his dramas were popular; but a few only have remained on the stage. Among his other productions, the best is his "*Vie de Marianne*," which abounds in interesting situations, faithful delineations, and tenderness of sentiments; "*Le Paysan Parvenu*," "*Le Philosophe Indigent*," &c., are not of much merit. The same forced and conceited style that disfigures his theatrical productions prevails in these romances. He became a member of the French academy in 1743, and died in 1763.

MARK, THE EVANGELIST, according to the old ecclesiastical writers, the person known in the Acts of the Apostles by the name of John Mark, was for many years the companion of Paul and Peter on their journeys. His mother Mary was generally in the train of Jesus, and his house at Jerusalem was open constantly for the reception of the apostles. He was himself present at a part of the events which he relates and received his information partly from eye-witnesses. His gospel is plainly intended for Christian converts from paganism. It is

not certain, however, whether it was first read at Rome or Alexandria, where he had established churches, or at Antioch. He is distinguished from the other evangelists by his brevity, passing over much that relates to the character of the Messiah, which could be important only to Jewish converts.

MARKLAND, JEREMIAH, an eminent critic, who was born in 1693, and received his education at Cambridge. In 1717 he obtained a fellowship in that university, which he held until his death in 1776. His time was devoted to his favourite studies, uninterrupted by any avocations but those of a college and travelling tutor. His principal works are, an edition of "The *Sylvæ* of Statius;" "Notes on *Maximus Tyrius*;" "Remarks on the *Epistles* of Cicero to Brutus, and of Brutus to Cicero;" with "A Dissertation upon Four Orations Ascribed to Cicero;" an edition of "The *Supplices Mulieres*" of Euripides; to which was annexed a tract, "De *Græcorum Quinta Declinatione*," and other philological works.

MARLOWE, CHRISTOPHER, an eminent English poet and dramatist of the Elizabethan age, was educated at Cambridge, where he was made M. A. in 1587. He afterwards settled in London, and became an actor, as well as a writer for the stage. Besides six tragedies of his own composition, and one written in conjunction with Thomas Nashe, he left a translation of "The Rape of Helen," by Coluthus some of Ovid's *Elegies*, the first book of Lucan's "Pharsalia," and "The Hero and Leander" of Musæus completed by George Chapman. The exact time of his death is not known; but, according to Anthony Wood, it took place previously to 1593, and was owing to a wound received from the hand of a servant-man, whom he had attacked on suspicion of being rivalled by him in the affection of a humble female.

MARMONTEL, JOHN FRANCIS, a popular French writer and dramatist, who was born in 1723. He was educated, with some difficulty on account of the poverty of his parents, at the Jesuits' college of Manriac, and afterwards became a teacher of philosophy, in a seminary of Bernardines, at Toulouse, and became a distinguished candidate for the prizes at the Floral games, which acquired him the notice of Voltaire, who recommended him to try his fortune at Paris. He accordingly arrived there in 1745, and, after experiencing some vicissitudes, brought out a tragedy in 1748, which at once raised him into competence and celebrity; and, having been recommended to Madame Pompadour, he was appointed secretary of the royal buildings, under her brother, the marquis de Marigny. Having distinguished himself by writing some of his well-known tales, to assist his friend Boissy, then entrusted with the "Mercure de France," on the death of the latter it was given to him, and, resigning his post of secretary, he took up his abode with Madame Geoffrin. He subsequently lost the "Mercure de France" by merely repeating in company a joke upon the duke d'Aumont, and was committed to the Bastille because he would not give up the real author.

In 1763, after much opposition, Marmontel succeeded Marivaux as a member of the French academy. His next literary production was "Bélisaire," which, in consequence of its liberal sentiments in favour of toleration, was censured by the Sorbonne, and widely read in every country in Europe. In order to benefit Grétry, he worked up several little stories into

comic operas, which were all acted with great success. On the death of Duclos he was appointed historiographer of France, and in 1783, on the death of D'Alembert, he was elected secretary to the French academy. On the breaking out of the revolution, he retired to a cottage in Normandy, where he passed his time in the education of his children, and the composition of a series of tales of a more serious cast than his former ones; together with his amusing memoirs of his own life. In April 1797 he was chosen member of the council of elders; but his election being subsequently declared null, he again retired to his cottage, where he died of an apoplexy, in December 1799, in the seventy-seventh year of his age.

The style of this author is so peculiar, that it is difficult, except by a long descriptive periphrasis, to convey any suitable idea of it. In its general nature, indeed, it is composed of the constituents of a perfect simplicity—a simplicity of thought—a simplicity of feeling—and a simplicity of language. But his simplicity is not the simplicity of an English writer. It has no resemblance to that of Sterne, and still less to that of Goldsmith. It is the simplicity of Marmontel, and of Marmontel alone. Amongst the works of Marmontel his reputation almost solely rests upon his "Moral Tales." He has been, indeed, the author of many other productions; of some poems, some comedies, and a kind of historical romance, of a peculiar kind. It is, however, somewhat singular that his poems are altogether as flat and insipid as his "Moral Tales" are pointed and spirited. He loses himself at the moment in which he attempts to become poetical. His figures are the most wretched common-place and his natural humour is lost in lengthened dilatation. His comedies are little better. He has no success when he steps out of his peculiar circle. He is equal to a scene, but not to an act. It is from the "Moral Tales," therefore, that we must endeavour to form a due estimate of the genius of Marmontel. With respect to the general plan of them, they are a species of narrative dramas. They have their fables, and their characters, and their peculiar scenery: the fable is some action of life and manners: the fidelity of the painting to the original in life constitutes its chief excellence. It is this, in fact, which may be termed the peculiar talent of Marmontel. He selects for his fable some certain action—something which we see daily passing in the domestic intercourse of life, and with equal judgment and accuracy follows it through all its parts with a representation as exact as lively. His tale is thus a domestic picture, a representation of manners as seen in the action which he has chosen for his subject. His dramatis personæ are as natural and as domestic as his fable. They are all of a piece, and seem as if taken together, and existing only for each other. They are imitated with the same fidelity as the action. He possesses the peculiar faculty of transmigrating into the person of each of his characters, and of investing himself as it were in the same circumstances. It is by this facility of substitution and general sympathy that he is enabled so correctly to imitate nature. It is this which constitutes his *naïvete*.

"The Shepherdess of the Alps" is perhaps the best specimen of the general style of Marmontel;—it is at once nature and romance. It has been adopted as the groundwork of an opera in almost every kingdom in Europe: the scenes are beautiful and the situation

impressive; it is an epic romance. When it appeared the author was anxiously sought out, and taken under the immediate patronage of a prince of the blood. He was, in fact, from that moment admitted into the society of the first men in France. To understand its character we must, however, take a brief specimen in an English dress:—In the mountains of Savoy, not far from the road from Briançon to Modena, is a solitary valley, the sight of which inspires travellers with a pleasing melancholy. Three little hills in form of an amphitheatre, on which are scattered at a great distance from each other some shepherds' huts, torrents that fall from the mountains, clumps of trees here and there, pastures always green, form the ornament of this rural place. The marchioness of Fonrose was returning from France to Italy with her husband. The axle-tree of their carriage broke; and as the day was on the decline they were obliged to seek in this valley for some shelter to pass the night. As they advanced towards one of the huts, they saw a flock going that way, conducted by a shepherdess whose gait astonished them. They drew nearer, and heard a heavenly voice, whose plaintive and moving accents made the echoes groan.

How the setting sun still glitters with a gentle light! "It is thus," said she, "that at the end of a painful race the exhausted soul departs to grow young again in the pure source of immortality. But alas, how distant is the period, and how long is life!" On saying these words the shepherdess retired with her head inclined; but the negligence of her attitude seemed to give still more nobleness and majesty to her person and deportment. Struck with what they saw, and still more with what they had just heard, the marquis and marchioness of Fonrose redoubled their pace in order to overtake this shepherdess whom they admired. But what was their surprise, when under the plainest head-dress, beneath the most humble garb, they saw all the graces, all the beauties united! "Child," said the marchioness to her, on seeing that she avoided them, "fear nothing; we are travellers whom an accident obliges to seek shelter in these huts till the day: will you be so good as to be our guide?" "I pity you, madam," said the shepherdess to her, looking down and blushing: "these huts are inhabited by poor persons, and you will be very ill lodged." "You lodge there without doubt yourself," replied the marchioness; "and I can easily endure for one night the inconveniences which you suffer always." "I am formed for that," said the shepherdess, with a modesty that charmed them. "No, surely," said the marquis de Fonrose, who could no longer dissemble the emotion she had caused in him, "no, you are not formed to suffer; and Fortune is very unjust! Is it possible, lovely damsel, that so many charms are buried in this desert under that habit?" "Fortune, Sir," replied Adelaide (this was the name of the shepherdess), "Fortune is not cruel but when she takes from us that which she has given us. My condition has its pleasures for one who knows no other, and custom creates wants for you which shepherds do not know."

"While she talked thus they arrived at the hut. It was separated by a partition from the fold into which this incognita drove her sheep, telling them over with the most serious attention, and without deigning to take any further notice of the travellers who contemplated her. An old man and his wife, such as Philomel and Baucis are described to us, came forth

to meet their guests with that village-honesty which recalls the golden age to our minds. "We have nothing to offer you," said the good woman, "but fresh straw for a bed, milk, fruit, and rye-bread for your food; but the little that Heaven gives us we will most heartily share with you." The travellers, on entering the hut, were surprised at the air of regularity which every thing breathed there. The table was one single plank of walnut-tree highly polished: they saw themselves in the enamel of the earthen vessels designed for their milk. Every thing presented the image of cheerful poverty, and of the first wants of nature agreeably satisfied. "It is our dear daughter," said the good woman, "who takes upon her the management of our house. In the morning, before her flock ramble far into the country, and while they begin to graze round the house on the grass covered with dew, she washes, cleans, and sets every thing in order with a dexterity that charms us." "What!" said the marchioness, "is this shepherdess your daughter?" "Ah! madam, would to Heaven she were!" cried the good old woman; "it is my heart that calls her so, for I have a mother's love for her; but I am not so happy as to have borne her; we are not worthy to have given her birth." "Who is she then? Whence comes she? and what misfortune has reduced her to such a condition?" "All that is unknown to us. It is now four years since she came in the habit of a female peasant to offer herself to keep our flocks; we would have taken her for nothing, so much had her good look and pleasing manner won upon our hearts. We doubted her being born a villager; but our questions afflicted her, and we thought it our duty to abstain from them. This respect has but augmented in proportion as we have become better acquainted with her soul; but the more we would humble ourselves to her, the more she humbles herself to us. Never had daughter more attention for her father and mother, nor officiousness more tender. She cannot obey us, because we are far from commanding her; but it seems as if she saw through us, and every thing that we can wish is done before we perceive that she thinks of it. She is an angel come down among us to comfort our old age." "And what is she doing now in the fold?" demanded the marchioness. "Giving the flock fresh litter; drawing the milk from the ewes and she-goats. This milk, pressed out by her hand, seems to become the more delicate for it. I, who go and sell it in the town, cannot serve it fast enough. They think it delicious. The dear child employs herself, while she is watching the flock, in works of straw and osier, which are admired by all. Every thing becomes valuable beneath her fingers. You see, madam, continued the good old woman, "you see here the image of an easy and quiet life: it is she that procures it to us. This heavenly daughter is never employed but to make us happy."

MAROT, CLÉMENT, an excellent French poet, who was born at Cahors in 1495, and was the son of John Marot, valet-de-chambre to Francis I., and poet to Queen Anne of Brittany. He enjoyed his father's place of valet-de-chambre to Francis I., and was page to Margaret of France, wife to the duke of Alençon. In 1521 he followed that prince into Italy, and was wounded and taken prisoner at the battle of Pavia; but at his return to Paris was accused of heresy, and thrown into prison, from whence he was delivered by the protection of King Francis I. He at length

retired to the queen of Navarre, then to the duchess of Ferrara, and in 1536 returned to Paris: but, declaring openly for the Calvinists, he was obliged to fly to Geneva; which he at length left, and retiring to Piedmont, died at Turin in 1544, aged fifty. His verses are agreeably filled with natural beauties. La Fontaine acknowledged himself his disciple, and contributed greatly to restore to vogue the works of this ancient poet. Marot, besides his other works, translated part of the Psalms into verse, which was continued by Beza, and are still sung in the Protestant churches abroad.

MARSDEN, WILLIAM, was born in 1754, at Verval in Ireland, and sent out early in life as a writer to the island of Sumatra, where he rose to be chief, and gained much information respecting the language, manners, and antiquities of the Oriental archipelago, a part of which he has communicated in articles sent by him to the royal and antiquarian societies. The chief of these are, "On a Phenomenon observed on the Island of Sumatra;" "Remarks on the Sumatran Language;" "Observations on the Language of the People commonly called Gipsies;" "On the Hejira of the Mohammedans;" "On the Chronology of the Hindoos;" and "On the Traces of the Hindoo Language and Literature extant amongst the Malays." His separate publications are, the "History of Sumatra," a dictionary of the Malayan language, and a grammar of the Malayan language, to which is prefixed an interesting discourse on the history, religion, and antiquity, of the Oriental Islands.

MARSH, HERBERT, a learned bishop of Peterborough, who was a native of London, and educated at St. John's college, where he was much distinguished both as a classical scholar and mathematician. Having obtained a fellowship and academical honours, he went to Gottingen to improve himself in modern languages. He resided several years in Gottingen, and there undertook the translation of one of the most profound works of Germany into English, viz., Michaelis's "Introduction to the New Testament," to which he added explanatory and supplemental notes. But he did not confine himself to theological studies; he sought for and gained much information on political affairs, which he transmitted to Pitt, who procured him a pension. When the French invaded Germany, he returned to England, and obtained the Margaret professorship of divinity in the university of Cambridge. He then engaged in a course of lectures on theology, and read them in English instead of Latin, by which he induced persons of all orders and descriptions to attend them. In 1792 he published "An Essay on the Usefulness of Theological Learning." He was soon engaged in controversy; first with Archdeacon Travis, in support of his notes on Michaelis. He next took up his pen against Mr. Belsham, for the purpose of defending his own hypothesis respecting the history of the gospel. He was afterwards engaged in a newspaper war on the dispute between Mr. Lancaster and Dr. Bell. He likewise published "An Essay on the English National Credit." What most recommended him to notice was his "History of the Politics of Great Britain and France," which was esteemed a full justification of the conduct of the English ministry. These exertions in the cause of church and administration rendered him conspicuous, and he was in 1816 appointed bishop of Llandaff, and soon after translated to the see of Peterborough.

His other works are "An Examination of the Conduct of the British Ministry relative to the Proposal of Bonaparte," "The Politics of Great Britain Vindicated," "A Dissertation on the Origin and Composition of the Three First Gospels," "Letters to the Anonymous Author of the Remarks on Michaelis and his Commentator," "The Illustration of his Hypothesis respecting the Three First Gospels," a defence of the above illustration, "A Course of Lectures on Divinity," "A Vindication of Mr. Bell's System of Education," "History of the Translations of the Scriptures," "Horse Pelagica," containing an inquiry into the history and language of the Pelasgians, with others of less note.

MARSHAL, ANDREW, an eminent Scottish physician, who was born in Fifeshire in 1742, and educated at the universities of Edinburgh and Glasgow. He rose to great eminence in his profession, and as an author is best known by his work "On the Morbid Anatomy of the Brain."

MARSHALL, SIR JOHN, a learned writer on history and chronology, who was born at London in 1602. He was warmly attached to Charles the First, and suffered severely in the civil wars. At the restoration he was knighted, became M. P. for Rochester, and afterwards obtained a baronetcy. He died in 1685. The most celebrated production of Sir John Marshall is entitled "Canon Chronicus Aegyptiacus, Ebraicus, Graecus, et Disquisitiones."

MARSHALL, STEPHEN, a presbyterian divine, who was a native of Godmanchester in Huntingdonshire, and educated at Emanuel college, Cambridge, where he took his degree of B.A. Fuller says, "That he was very popular with the members of the long parliament, who referred to him in all affairs of moment." He died in 1655, and was buried in Westminster Abbey. Dr. Marshall was one of the authors of the celebrated work entitled "Smectymnuus."

MARSHALL, THOMAS, an English divine, who was born at Barkby in Leicestershire in 1621, and educated at Lincoln college, Oxford. On the ruin of the royal cause in England, he went to the continent, where he remained till the restoration. He subsequently received several valuable church preferments, and died in 1681. He was the author of "A Commentary on the Gothic and Anglo-Saxon Versions of the Gospel," and several other valuable works.

MARSHALL, WILLIAM, a writer of considerable talent, whose works have been of great service in the important science of agriculture and rural economy. His first production was entitled "Minutes of Agriculture on a Farm of Three Hundred Acres of Various Soils, near Croydon, Surrey," which was followed by another on the "Rural Economy of the County of Norfolk," and similar works relating to the midland counties of England. Mr. Marshall died in Yorkshire in 1818.

MARSIGLI, LODOVICO FERNANDO, COUNT OF, was born in 1658, of an illustrious family, at Bologna, and, after having received a good education, went to Constantinople in 1679 with the Venetian ambassador. On his return he entered into the imperial service, and was employed as an engineer in the war with Turkey. He was taken prisoner at the passage of the Raab, and sent as a slave to Bosnia. On obtaining his liberty he was again employed, and having been made a colonel of infantry, was sent with his regiment to garrison the fortress of Brisac; and that place being taken by the French in 1702,

was accused of misconduct, and ignominiously dismissed from the Austrian service. Retiring to Switzerland, he published a justificatory memoir, and afterwards took up his residence at Cassis, near Marseilles, where he occupied himself with the study of marine botany, and other scientific pursuits. In 1709 Pope Clement XI. made him commander of his troops; but he soon relinquished this office, and retired to his native place, where in 1712 he founded the institute of Bologna. He afterwards travelled in England and Holland, and in 1725 published at Amsterdam his "*Histoire Physique de la Mer*," and in 1726 his most valuable work, the "*Danubius Pannonico-Mysicus*" containing the natural history of the Danube, in its course through Hungary and Turkey. He died at Bologna in 1730.

MARSTON, JOHN, an English dramatic author, who lived in the reign of James I., was educated at Corpus Christi college, Oxford, and was entered at the Middle Temple, of which society he became lecturer; but little more of his personal history is known except that he was at one time upon terms of friendship with Ben Jonson. He was the author of eight plays, all acted at the Blackfriars with applause. Six of these were printed in one volume in 1633, and dedicated to the viscountess Falkland. He also wrote three books of satires, entitled "*The Scourge of Villany*."

MARTHA, SISTER.—This kind hearted member of the catholic church was long deservedly admired for her active and impartial humanity. Anne Biget, known by the name of Sister Martha, was before the French revolution what is called a *touriere* in a convent; that is, a nun who has the care of the turning box, fixed on pivots in the wall, by means of which messages and articles are conveyed to and from the convent, without any of the nuns being seen. When the dissolution of the convents compelled her to return into society, she dedicated her time and her means to the consoling of the poor, and particularly of prisoners. Though her pecuniary resources were small, her kindness was unbounded. In 1809, when she was between sixty and seventy years of age, six hundred Spanish prisoners arrived at Besançon, the place where she resided. She hastened to their assistance, did her utmost to supply their wants, and watched over those who were sick. She was often employed by them to solicit the governor of Besançon, when they had any thing to request; and one day, when she was visiting him on this kind of errand, he said, "Sister Martha, you will be much grieved to hear that your good friends the Spaniards are going to leave Besançon." "Yes," replied she, "but the English are coming, and all the unfortunate are my friends." Her impartial benevolence was indeed extended to all; and in 1814 its utmost powers were called forth to comfort and assist the wounded French and allied soldiers. "It was on the field of battle," said the duke of Reggio to her, "that I became acquainted with your character. Our soldiers, when they were wounded, and far from their country, used to exclaim, 'Oh, where is Sister Martha? If she were here, we should suffer less.'" After the confederated sovereigns obtained possession of Paris they were desirous of seeing this admirable woman, and did not forget to reward her virtues. The emperor of Russia gave her a gold medal and a sum of money, the emperor of Austria the cross of civil merit and 2000 francs, and the king of Prussia a gold

medal. The Spanish monarch sent her a cross. She was also presented to Louis XVIII., who received her graciously, and conferred honours upon her. She died at Besançon in 1824.

MARTENS, GEORGE FREDERIC VON, an eminent German writer, whose earliest work, which has become a standard book on the subject, was published at Göttingen in 1789, and was translated by Cobbett. It bears the title of "*A Compendium of the Law of Nations, Founded on the Treaties and Customs of the Modern Nations of Europe*." He afterwards published "*A Course of Diplomacy*," "*A Collection of the Principal Treaties of Peace and Alliance since 1761*," and several other works. The merit of these works caused the services of the author to be sought for by the German sovereigns. In 1807 Jerome Bonaparte appointed him a counsellor of state in the financial department, and he was retained in it after the fall of Jerome. In 1814 he was employed at the congress of Vienna, to draw up the reports of the conferences between the ministers, and was afterwards sent on a mission to Prince Christian in Norway. In 1816 he was nominated minister from Hanover to the diet at Frankfort, where he died in 1821.

MARTIAL, MARCUS VALERIUS, the most celebrated of the epigrammatical writers among the Romans. He was born at Bilbilis, in Celtiberia, A. D. 43, and educated at Calaguris, the birth-place of his friend Quinctilian. He went to Rome when young, during the reign of Nero, and lived under the reign of Galba and the following emperors; from some of whom he received marks of esteem and favour. Domitian appointed him tribune, and made his circumstances more easy by presents, but Trajan, who was no friend to satirists, withheld the favour which Martial had received from his predecessors. This induced the poet to retire to his native city. Pliny the Younger gave him a sum of money to pay the expenses of the journey. While in Italy he married a Spanish lady, who brought him a considerable estate. He died in the year 101. His celebrity is founded on fourteen books of epigrams. The number and value of his epigrams give a high idea of the wit of the poet. Most of them are ingenious and cutting; many are full of grace and Attic salt; and many, in which he chastises the vices of his age, are extremely indecent and immodest. He is the true father of modern epigram, which is distinguished from the simple Greek epigram, by the convergence of all its parts to one witty point.

MARTIN, BENJAMIN, a clever mathematician and natural philosopher, who was a native of Worpleston in Surrey, where he is said to have worked as a day-labourer. From this situation he raised himself to the rank of schoolmaster, and then commenced lectures on experimental philosophy. In addition to which he carried on the business of globe maker and optician in London. There he continued for many years, but owing to the mismanagement of his son he became a bankrupt. This misfortune had such an effect on his mind that he attempted to commit suicide, and although the injury did not prove fatal yet it hastened his death, which took place in 1782. His publications were very numerous and relate almost exclusively to scientific subjects.

MARTIN, WILLIAM, an eminent naturalist, who was born at Marsfield, Nottinghamshire. He was educated for the stage, but having a natural taste for drawing and natural history, he directed his at-

tention to those subjects. In 1793 he published the first number of "Figures and Descriptions of Petrifications in Derbyshire," which was followed by several other works of a similar character. He was a member of several of the learned societies of Great Britain, and died on the 31st of May, 1810.

MARTYN, HENRY, an able missionary, who was born in Cornwall in 1781; in 1797 entered St. John's college, Cambridge, of which society he was chosen fellow in 1802. The following year he took orders, and in 1805 went to India as a chaplain to the East India company. In the east he distinguished himself by his rapid acquirement of the native languages. He became master of Sanscrit, translated the Common Prayer into Hindoostanee, and performed divine service publicly in that language. From India he proceeded to Shiraz in Persia, and translated the Psalms and New Testament into the Persian tongue. He also held conferences with the learned Mohammedans, and converted some of them to Christianity. He died of a decline in Persia in 1812.

MARTYN, JOHN, an excellent botanical writer, who was born in London in 1699. His first work was "A History of Plants growing about Paris," which was followed by others of a similar character. This gentleman died at his house at Chelsea in 1768.

MARTYN, THOMAS, an English divine, who is well known for his botanical, antiquarian, and other works. He was born at Chelsea and educated at Cambridge. Through the influence of his friends he obtained some valuable church preferments. He published "The English Connoisseur;" "Antiquities of Herculeaneum," a new edition of Miller's "Gardeners' Dictionary," besides several other works of considerable merit.

MARTYR, PETER, an Italian writer, who, after having attached himself to the cardinal Visconti, and to the archbishop of Milan, went to Spain, distinguished himself in the military service of Ferdinand and Isabella, and then embraced the clerical profession. Ferdinand employed him in some important affairs, and created him counsellor of the Indies. Charles V. also treated him with favour. He died in 1526. His principal works are, "De Rebus Oceanicis et Orbe Novo Decades,"—a history of the discoveries of Columbus and his successors, from their own relations; "De Insulis nuper Inventis;" "De Legatione Babylonica,"—an account of his embassy to Egypt, whither Ferdinand had sent him in 1501; and his "Opus Epistolarium."

MARTYR, PETER, one of the earliest protestant divines, who was particularly distinguished for learning and abilities. He was born at Florence in the year 1500, and entered at the age of sixteen into the order of the regular canons of St. Augustine at the monastery of Fiesole. In 1519 he removed to Padua, where he studied Greek and philosophy. In 1526 he commenced preacher, and attracted great applause in several cities of Italy. After receiving numerous important offices in his order, his religious opinions were considered as savouring too much of the doctrines of the reformers, and it became necessary for him to quit Italy and Zurich. In Switzerland he was received in a friendly manner by the protestant clergy. Soon after he became professor of divinity at Strasburg, and in 1547 accompanied Bucer, Fagius, and other learned reformers, on the invitation of Archbishop Cranmer, to England. Martyr had followed

the example of Luther, in marrying a nun who had renounced her vows. He was appointed to the theological chair at Oxford in 1549, and became a very efficient assistant to the English reformed clergy, in carrying on their plans of innovation in the church. On the accession of Queen Mary, being commanded to quit the country, he returned to Strasburg, and resumed his former situation. In 1556 he removed to Zurich to occupy the office of theological professor, and in 1561 he assisted at the celebrated conference between the catholics and protestants held at Poissy in France, and died at Zurich in the following year. Peter Martyr was the author of many works on divinity, including commentaries on some parts of the Old and New Testaments. He is said to have excelled Calvin in erudition and the knowledge of languages, and his personal character was extremely amiable.

MARVELL, ANDREW, an able writer and uncorruptible patriot, who was born at Kingston-upon-Hull in 1620. His father was master of the grammar school and lecturer of Trinity church in that town. Fuller speaks of him as an excellent preacher, who "never broached what he had new-brewed, but preached what he had studied some competent time before." Echard styles him, "the facetious Calvinistical minister of Hull." He was drowned in crossing the Humber in rough weather. At the age of fifteen, Marvell was sent to Trinity college, Cambridge, but he appears to have left the university shortly after the death of his father, about 1641, without taking any degree, and to have joined Milton in Italy, or to have met him there. He spent four years abroad, in Holland, France, Italy, and Spain, "to very good purpose and the gaining of those four languages." He subsequently resided for some time with General Fairfax's family, being "intrusted to give some instructions in the languages to the lady his daughter." In 1653 he was selected by Cromwell to be tutor to his nephew, Mr. Dutton; and in 1657 he was appointed assistant Latin secretary to the protector, under Milton. The affectionate veneration which he cherished for his illustrious and "honoured friend," is a pleasing trait in Marvell's character.

He was among the few friends who frequently visited the great poet when secreted through fear of

his enemies; and Mr. Dove conjectures, not improbably, that the humour of Marvell might have contrived the mock funeral of Milton, which is reported to have duped his persecutors into a belief of his death. Marvell's spirited lines on "Paradise Lost," now prefixed to all editions, are an interesting memorial of a friendship honourable to both. In 1660 Marvell was returned by his native town to the new parliament, or convention, which ushered in the restoration; and to this circumstance he probably owed the immunity, and even favour, which he enjoyed under the restored government, notwithstanding his having held office under the protector. He was again returned, in December of the same year, as a member of the king's first parliament, and a third time to the parliament of 1661. Prudence might have induced him afterwards to absent himself from the house and the country, during the disgraceful scenes that ensued; for, from the middle of 1661 to April 1663 he appears to have resided on the continent. His absence at length led the high-steward of Hull, Lord Bellasis, to give directions to the corporation to elect a new member in case of their burgess not appearing in his seat in parliament.

At the call of his constituents, Marvell returned and resumed his seat; but three months after he accepted the offer of Lord Carlisle, who had been appointed ambassador extraordinary to Muscovy, Sweden, and Denmark, to attend his lordship as secretary. This voyage, he tells his constituents, he undertook "with the order and good-liking of his majesty, and by leave given from the house, and entered in the journal." The embassy occupied nearly two years; after which we find Marvell attending the parliament at Oxford in 1665. From that time to 1678 he appears to have devoted himself with the most exemplary assiduity to his parliamentary duties as member of the house of commons, keeping up a constant correspondence by letter with his constituents at Hull.

At this time members were paid by their constituents. The "wages" were, for a burgess, two shillings a-day, and for a knight of the shire four shillings. And in ancient times there were instances in which boroughs petitioned to be excused from sending members to parliament, as being unable to bear such an extraordinary expense! Marvell is supposed to have been the last representative that received wages from his constituents, the very last, probably, that contrived to make them pay for his dinners. The story of his refusing 1000*l.* from Lord Treasurer Danby, at a time that he was at his last guinea, is told with variations; but there is no reason to doubt its substantial authenticity. Although he is not known to have spoken in parliament, he obtained a considerable influence by his weight of character, talent, and indefatigable attention to parliamentary business. After he had become obnoxious to the court party, Prince Rupert, it is said, would frequently visit him privately in his lodgings; "so that, whenever his royal highness voted on the side of Marvell, which he often did, it was the observation of the adverse faction, that 'he had been with his tutor.'"

In 1672 Marvell first entered the lists with Parker. In 1675 he took up his pen in reply to an attack made upon Bishop Croft's "Naked Truth." He was also the author of various valuable political tracts and facetiæ. For his last production, "An Account

of the Growth of Popery and Arbitrary Government in England," printed in 1678, he was threatened by the court with prosecution, a reward being offered for the discovery of the writer; and it is even supposed to have cost him his life, which was thought to have been shortened by poison. He died on the 16th of August in the same year, in the fifty-ninth year of his age, and in the full vigour of his constitution. He was buried in the church of St. Giles-in-the-Fields, at the expense of the corporation of that town which he had so long and faithfully represented.

The first edition of Marvell's poems is posthumous, and was published in folio in 1681 by a bookseller, who bought his manuscripts from the woman in whose house Marvell lodged, and who is made to certify their authenticity in the advertisement prefixed to them, in the assumed character of his widow. Marvell was never married; and the "cheat was soon detected." As these poems were not left by Marvell for publication, but merely found among his papers, it is impossible to determine whether he was the actual author of all the compositions ascribed to him. That he was a poet of no contemptible talents, his lines on "Paradise Lost" evince; but nothing is more likely than that he should have copied into his common-place book many productions, which pleased him, by different authors. The best edition of his poems is that published by Thomas Davies in the year 1726. In 1775 Captain Edward Thompson, of Hull, a very zealous liberal of his day, but not very peculiarly fitted for the literary task he undertook, published "The Works of Andrew Marvell, Esq., with a New Life."

Marvell might occasionally trifle in poetry; but in his prose writings he appears in his native vigour of character as the indignant satirist and the intrepid advocate of freedom. In the "Rehearsal Transposed," appears the following ironical lament on the "doleful evil" of the press, which must serve as a sufficient specimen. "The press hath owed him (Parker) a shame a long time, and is but now beginning to pay off the debt. The press (that villanous engine) invented much about the same time with the reformation, hath done more mischief to the discipline of our church than the doctrine can make amends for. It was a happy time when all learning was in manuscript, and some little officer, like our author, did keep the keys of the library; when the clergy needed no more knowledge than to read the liturgy, and the laity no more clerkship than to save them from hanging. But now, since printing came into the world, such is the mischief, that a man cannot write a book, but presently he is answered. Could the press but at once be conjured to obey only an imprimatur, our author might not disdain, perhaps, to be one of its most zealous patrons. There have been wayes found out to banish ministers, to find not only the people, but even the grounds and fields where they assembled in conventicles; but no art yet could prevent these seditious meetings of letters. Two or three brawny fellows in a corner, with mere ink and elbow-grease, do more harm than a hundred systematical divines, with their sweaty preaching. And what is a strange thing, the very sponges, which one would think should rather deface and blot out the whole book, and were anciently used for that purpose, are become now the instruments to make them legible. Their ugly printing letters, which look but

like so many rotten tooth-drawers; and yet these rascally operators of the press have got a trick to fasten them again in a few minutes, that they grow as firm a set, and as biting and talkative as ever. O, printing! how hast thou disturbed the peace of mankind! That lead, when moulded into bullets, is not so mortal as when formed into letters! There was a mistake, sure, in the story of Cadmus; and the serpents' teeth which he sowed were nothing else but the letters which he invented. The first essay that was made towards this art was in single characters upon iron, wherewith of old they stigmatized slaves and remarkable offenders; and it was of good use, sometimes, to brand a schismatic; but a bulky Dutchman diverted it quite from its first institution, and, contriving these innumerable syntagmes of alphabets, hath pestered the world ever since with the gross bodies of their German divinity. One would have thought in reason that a Dutchman might have contented himself only with the wine-press."

*Andr. Marvel*

MARY, queen of England, eldest daughter of Henry VIII. by Catharine of Arragon. She was born in 1517, and received a good classical education. Her first preceptor was the celebrated Linacer, who drew up for her use "The Rudiments of Grammar," and afterwards, "De Emendata Structura Latini Sermonis Libri Sex." Linacer dying when she was but six years old, Ludovicus Vives, a learned Spaniard, became her next tutor; and composed for her, "De Ratione Studii Puerilis." Under the direction of these teachers, she became so good a Latin scholar that Erasmus commends her for her epistles in that language. Towards the end of her father's reign, at the earnest solicitation of Queen Catharine Parr, she undertook to translate Erasmus's "Paraphrase on the Gospel of St. John;" but owing to sickness, after she had made some progress in the work, she left the rest to be done by Dr. Mallet, her chaplain. This translation is printed in the first volume of Erasmus's "Paraphrase upon the New Testament," London, 1548, folio; and before it is a preface written by Udall, the celebrated master of Eton school, and addressed to the queen dowager. This preface contains some very interesting passages illustrative of the history of the times. Mr. Udall remarks on "the great number of noble women at that time in England, not only given to the study of human sciences and strange tongues, but also so thoroughly expert in the Holy Scriptures that they were able to compare with the best writers, as well in inditing and penning of godly and fruitly treatises, to the instruction and edifying of realms in the knowledge of God, as also in translating good books out of Latin or Greek into English, for the use and commodity of such as are rude and ignorant of the said tongues. It was now no news in England to see young damsels in noble houses, and in the courts of princes, instead of cards and other instruments of idle trifling, to have continually in their hands either psalms, homilies, and other devout meditations, or else Paul's epistles, or some book of holy scripture

matters, and as familiarly both to read or reason thereof in Greek, Latin, French, or Italian, as in English. It was now a common thing to see young virgins so trained in the study of good letters that they willingly set all other vain pastimes at nought for learning's sake. It was now no news at all to see queens and ladies of most high estate and progeny, instead of courtly dalliance, to embrace virtuous exercises of reading and writing, and with most earnest study, both early and late, to apply themselves to the acquiring of knowledge, as well in all other liberal arts and disciplines, as also most especially of God and his holy word. And in this behalf like to your highness, as well for composing and setting forth many godly psalms, and divers other contemplative meditations, as also for causing these paraphrases to be translated into our vulgar tongue, England can never be able to render thanks sufficient; so may it never be able, as her deserts require, enough to praise and magnify the most noble, the most virtuous, the most witty, and the most studious Lady Mary's grace, for taking such pain and travail in translating this Paraphrase of "Erasmus upon the Gospel of St. John." What could be a more plain declaration of her most constant purpose to promote God's word, and the free grace of his gospel?" Mr. Udall appears to have been mistaken; as she never meant any such thing: for soon after her accession to the throne, a proclamation was issued for calling in and suppressing this very book, and all others that had the least tendency towards furthering the reformation.

King Edward died on the 6th of July, 1553, and Mary was proclaimed queen the same month, and crowned in October by Stephen Gardiner, bishop of Winchester. Upon her accession to the throne, she declared in her speech to the council, that she should not persecute her protestant subjects; but in the following month she prohibited preaching without a special license; and before the expiration of three months the protestant bishops were excluded the house of lords, and all the statutes of Edward VI. respecting the protestant religion were repealed. In July 1554 she was married to Philip prince of Spain, eldest son of the emperor Charles V.; and now began that persecution against the protestants for which her reign is so justly infamous. Some have supposed that the queen was herself of a compassionate and humane disposition, and that most of those barbarities were transacted by her bishops without her knowledge or privity. For this view of her character we have however no warrant in history. Burnet says, "that her firm adherence to her mother's cause and interest, and her backwardness in submitting to the king her father, were thought crimes of such a nature by his majesty, that he came to a resolution to put her openly to death; and that when all others were unwilling to run any risk in saving her, Cranmer alone ventured upon it;" and yet we know the cruel death that that amiable prelate suffered.

Mary, after a reign which must ever be considered as the most disgraceful for religious bigotry in the English annals, fell a sacrifice at last to disappointed expectations, both of a public and domestic kind, and especially the absence and unkindness of Philip; which are supposed, by deeply affecting her spirits, to have brought on the illness of which she died on the 7th of November, 1558, after a reign of five years, four months, and eleven days. "It

is not necessary," says Hume, "to employ many words in drawing the character of this princess. She possessed few qualities, either estimable or amiable, and her person was as little engaging as her behaviour and address. Obstinacy, bigotry, violence, cruelty, malignity, revenge, tyranny,—every circumstance of her character took a tincture from her bad temper and narrow understanding. And amidst that complication of vices, which entered into her composition, we shall scarcely find any virtue but sincerity; a quality which she seems to have maintained throughout her whole life; except in the beginning of her reign, when the necessity of her affairs obliged her to make some promises to the protestants which she certainly never intended to perform. But in these cases a weak bigoted woman, under the government of priests, easily finds casuistry sufficient to justify to herself the violation of a promise. She appears also, as well as her father, to have been susceptible of some attachments of friendship, and even without the caprice and inconstancy which were so remarkable in the conduct of that monarch. To which we may add, that in many circumstances of her life she gave indications of resolution and vigour of mind, a quality which seems to have been inherent in her family."

Mary possessed considerable literary attainments, and her "Three Prayers" are creditable to the times in which she lived. In Fox's "Acts and Monuments" are printed eight of her letters to King Edward and the lords of the council, on her nonconformity, and on the imprisonment of her chaplain Dr. Mallet. In the "Sylloge Epistolarum," are several more of her letters, extremely curious: one on the subject of her delicacy in never having written but to three men; one of affection for her sister; one after the death of Anne Boleyn; and one very remarkable letter by Secretary Cromwell to her. In "Haynes's State Papers" are two in Spanish, to the emperor Charles the Fifth. We subjoin her autograph.

*Marye the quene*

MARY, queen of England.—This sovereign reigned jointly with her husband William III. She was born in 1662, and her father, James the Second, bestowed her hand in marriage on the prince of Orange, as soon as she had entered her fifteenth year. Mary remained in Holland till 1689, when in consequence of the abdication of James she was crowned with her husband at London. Mary, of whose personal character but little is correctly known, died of the small-pox in 1694.

MARY, queen of Scotland.—This ill-fated sovereign, celebrated alike for her beauty, and the perversion of great natural acquirements, was born in 1542. She was the daughter of James V. of Scotland, and lost her father when but eight days old. She was early taught the Latin, French, Spanish, and Italian languages, in which she attained great proficiency.

In 1558 Mary was married to Francis II. of France, but the prince dying in 1560, the queen returned to Scotland, from which she had long been absent. Queen Elizabeth had sent a fleet to arrest her progress; but, owing to a propitious fog, the Scottish queen reached the land of her fathers, and with a

glad and lightsome heart entered the capital amidst the shouts and congratulations of her subjects.

The discussions between the two queens now excited considerable interest, and an arrangement was proposed by their ministers that they should have a personal conference in some of the northern counties. Mary, who speedily forgot any injury done to herself, acceded most cheerfully to the proposal; but Elizabeth, whether from jealousy of Mary's charms, or from apprehension that her presence might influence her partisans in England, declined the interview. Cecil urged, in reply to Mary's proposal of visiting her royal relative, that the rains had made the roads impassable; that the queen's houses on the road between London and York were out of repair; and that the necessary supply of wine, fowl, and poultry, could not be made in the short space of a month. The jealousy of the English queen was soon, however, called into action. Mary informed her she had received a proposal of marriage from the archduke Charles. This it directly became the business of Cecil to prevent; and to that effect he formed two plans: the first was to bring Elizabeth forward as her personal rival, which he did by employing the duke of Wirtemberg to solicit, as from himself, that Ferdinand would renew the suit from his son to the queen of England; but Ferdinand replied, that he should not expose himself a second time to the selfish and insincere policy of Elizabeth. Cecil then tried his other plan, to make the Scottish queen refuse the archduke. For this he commissioned Randolph to return, and read the queen a lecture on the recommendations necessary in the man whom she should select, telling her at the same time, her sister was not displeased that she should entertain thoughts of marriage, though she herself preferred a single life.

The marriage of the Scottish queen was a subject of active intrigue in the courts of England and Scotland. Elizabeth had shown such ambiguity in word and conduct, and displayed such caprice in her recommendations and her refusals, that she at length proposed her own favourite, Lord Robert Dudley, as a proper husband, to her sister: but Mary considered it beneath her dignity to marry a mere subject, and also hinted her opinion that Elizabeth could not well

spare him. By the advice of her council, Mary had now refused every foreign suitor, and accepted Lord Darnley, son of the countess of Lennox, which marriage would unite with her own the claims of the children of Margaret, eldest sister of Henry VIII. As he was after Mary the next heir to the crown of England, and was moreover an Englishman by birth, and could not by his power and alliances give any cause of suspicion to Elizabeth, it was expected this marriage would not be displeasing to that princess.

At the receipt of this intelligence the English cabinet employed Throckmorton to go and remonstrate with the Scottish queen. He went, and finding his threats and promises were useless, he stirred the disaffected lords to rebel against their sovereign. Murray, who had long laboured to fix the crown of Scotland on his own head, declared that "the profession of the evangel" was in danger, and retired from court under pretext that his conscience could not endure the idolatrous worship in the royal chapel. A plan was formed to murder Lord Darnley and his father, to imprison the queen and to place Murray at the head of the government. The conspirators were, however, disappointed; a person hinted to the queen that there was an intention of intercepting her on her road to Callendar; and, instead of going in the evening, she reached the place by ten in the morning, and on her arrival in Edinburgh she called on her subjects for aid against the insurgents, married Darnley, whom she had created earl of Ross and duke of Albany, in the chapel of Holyrood House, and issued a proclamation, commanding that all writs should run in the style of Henry and Mary, king and queen of Scotland.

The English ministers supplied Murray with money and men, though Mary had requested her "good sister" to be content with the government of England, and leave Scotland to its own sovereign. Mary succeeded in driving the rebellious lords from Dumfries, and they found an asylum with the duke of Bedford at Carlisle.

Mary, whose ardent passion for Darnley had caused her to overlook the natural defects of his character, now found that he was capricious, violent, and vindictive; and that he had acquired such a habit of inebriety, as sometimes even to forget the respect due to his consort. But above all he was ambitious, and felt incensed against his queen because she refused to secure to him by parliament the kingdom of Scotland during his natural life; and he directed his resentment towards her advisers, particularly to her secretary, David Riccio. This man was a native of Piedmont, formerly in the suite of the ambassador of Savoy. At the request of that minister Riccio was made a page of the chamber, and on the removal of the French secretary, had succeeded him in that office. All the foreign correspondence passed through his hands; and, in addition, on the queen's marriage he was appointed keeper of the privy purse to the king and the queen. His being a foreigner, and a catholic, caused his promotion to be viewed with jealousy by the courtiers and the preachers. Besides the fugitive lords who had fled to England, there still remained several of the conspirators in the Scottish court: these were all in dread of the act of attainder, which their rebellious conduct had merited; but, seeing the dissension between the king and the queen, they hoped to gain the former to their party, and through the agency of George Douglas, suggested

to the king that Mary had transferred her affections to Riccio,—said it was to his advice he owed the queen's denial of the matrimonial crown,—and advised him, as the certain way to obtain his just rights, to call in the aid of the expatriated lords. The inexperienced Darnley fell into the snare, and thus threw himself into the arms of his enemies.

One of the first results of this compact was the murder of Riccio, which took place at Holyrood House in March 1566. In the month of June following she gave birth to a son, afterwards James VI. On the 10th of February, 1567, Darnley was killed by the blowing up of the house called Kirk of Field, in the vicinity of Edinburgh, where he lay ill,—an event which was unquestionably the result of design, whoever were the guilty parties. On the 15th of May, Mary became once more a wife, by giving her hand to the earl of Bothwell, the man who was universally accused of having been the contriver of the murder of her late husband, and who indeed may be said to have been since proved to have been the author of that crime. We are not perhaps warranted to conclude, as some writers appear to have been inclined to do, from this act alone, taking all circumstances into consideration, either that Mary herself had been a party to the murder, or even that she was cognizant of Bothwell's guilt; but it seems impossible to acquit her of a most indecorous and profligate indifference as to whether he was guilty or no. Her imprudent conduct, to call it by no harsher name, brought its punishment after it, in a life henceforth of almost unmixed trouble and sorrow.

Party violence now ran very high in Scotland, and the disputes were continually fomented by Elizabeth's emissaries, so that Mary was ultimately shut up a close prisoner at Loch Leven. The ruins of this celebrated royal prison are represented in the engraving, and their interest is in no small degree increased by the description of Mary's confinement furnished by Sir Walter Scott in one of his most popular novels.

While at Loch Leven, Mary was compelled to sign a renunciation of her crown in favour of her son, but made her escape on the 2nd of May, 1568, and fled to Hamilton Castle, in Lanarkshire, where she was soon joined by some thousands of her adherents. But the result of the battle of Langside, fought on the 13th, in which her forces were completely defeated by the Regent Murray, suddenly left her again a helpless fugitive. After concealing herself for a few days in the house of Lord Herries in Galloway, she took boat at Kirkcudbright on the 16th, and putting across the Solway, landed at Workington in Cumberland. She never again set foot on the soil of her native country. Queen Elizabeth, who, from their relative political position and certain feelings of a more private nature, was her rival and her irreconcilable enemy, had now got her victim within her grasp, and was not the woman to permit her again to escape. Mary had arrived in the English territory in a state of nearly entire destitution, without a shilling in her pocket, or an article of dress except what she wore on her person. After a few days she was conducted by Elizabeth's order to Carlisle, from whence, on the 16th of June, she was removed to Bolton Castle, the house of Lord Scroop, warden of the West Marches. The honours due to her regal rank were at the same time punctiliously paid to her. Here she remained till the beginning

of the next year, when she was transferred to Tutbury Castle in Staffordshire, and committed to the custody of the earl of Shrewsbury. This continued to be her principal place of confinement during the remainder of her life, although she spent some short periods at Whinfield in Derbyshire, at Chatsworth in the same county, at Coventry, Sheffield, and other places.

In 1570 the cause of Mary obtained a temporary ascendancy, in consequence of the death of Murray, who was shot in Linlithgow by Hamilton of Bothwellhaugh, whose wife had become mad from the illtreatment of a retainer of the regent. Lennox, the grandfather of the young king, succeeded Murray in his office. This change caused the opinion of the English cabinet to alter. Elizabeth now began to apprehend that to retain the Scottish queen longer in England might be attended with many inconveniences; she, therefore, sent Cecil and Sir Walter Mildmay with proposals to the captive queen, that she should relinquish all claim to the crown of England; that she should not espouse any Englishman without Elizabeth's consent, nor any other person without the consent of the states of Scotland; that the murderers of the late king should be brought to condign punishment; that the young king of Scotland should be educated in England; and that six Scottish noblemen should be delivered as hostages to Elizabeth, for the performance of these articles. Elizabeth ordered Cecil and Mildmay to go to Chatsworth to treat with the captive Mary; but with those apparent signs of an adjustment, so many delays were contrived, and such capricious changes took place in the mind of Elizabeth, that Cecil, who had lately been raised to the peerage as Baron Burleigh, relieved the perplexities of his royal mistress by a proposal of marriage to her majesty with the duke of Anjou, brother to the French monarch. The commissioners returned to Scotland, because, in case of marriage, no accord with Mary was requisite,—but this only proved an interruption to gain time. Elizabeth made it a condition of the matrimonial contract that Anjou should embrace the reformed faith; and the negotiation ended by the French prince himself being bound to refuse, what, otherwise, he said, it would have been his most ardent wish to obtain.

Philip of Spain, as well as the Roman pontiff, had some months before offered some assistance to the Scottish queen. The latter waited the result of negotiations between her people and England, until driven to despair by the sudden interruption of the

conferences, Mary resolved to avail herself of their offer, and she sent Rudolphi, an Italian, as her ambassador, to Alva, governor of the Netherlands, and to the king of Spain, and the Roman pontiff. In England the duke of Norfolk, with many other catholic noblemen, had laid frequent plans for the liberation of Mary, in order to replace her on her throne. Some letters of a correspondence on this subject between Norfolk and the duke of Alva were intercepted. Burleigh was ever the enemy of Norfolk, and the resentment of Elizabeth was, by him, roused by the duke's perseverance in his suit of marriage to Mary. The minister urged the necessity of making him an example, to warn the other friends of that unfortunate queen. Several treasonable facts were alleged against him, to which he replied by a declaration of his innocence; and had it not been for the insurmountable difficulties, which in that age attended the cause of any prisoner under a prosecution by the crown, the duke might have justified himself by proving that he had acted solely with a view of restoring Mary to the throne of Scotland, without desiring any detriment to Elizabeth, and without any reference whatever to the royal succession in England. The duke was arraigned before his peers, went through such a form of trial as his enemies thought most likely to procure the desired event of his death, and was by them condemned to suffer the punishment of a traitor. Twice Elizabeth signed the warrant for his execution, and each time remanded the order, for the queen declared herself averse to his death, as he was not only the chief of the English nobility, but he was allied to her by blood. Burleigh, fearful that the duke's life would be spared, had recourse to his former stratagem to excite the fears of his royal mistress, by telling her that until she applied the axe to the root of the evil, and that the Scottish queen should repose in the grave, neither the crown nor the life of her majesty could really be secure. But as Elizabeth still continued irresolute, the artful minister sought the aid of parliament; this interference, however, was unnecessary, as the queen had signed the warrant a third time, and did not revoke the command.

To Burleigh's suggestions relating to the Scottish queen, Elizabeth declared the strongest repugnance to put to death "the bird" (to use her own expression) "that, to escape the lure of the hawk, had fled to her feet for protection." But in this the parliament served his wishes, by resolving to pass a bill of attainder against Mary: but the queen forbade the proceedings. They then brought forward another bill intended to render her incapable of the succession: this also the queen prevented; but she instituted an inquiry into the conduct of Mary, who replied to the commissioners, that in her project of marriage with the late duke of Norfolk she was free from any hostile feeling against her good sister. The death of Norfolk, and the proceedings of the parliament, disheartened the friends of Mary in England, and their number gradually diminished. Scotland was in arms; the archbishop of St. Andrew's had suffered on the gallows, by order of the regent Lennox; and the kingdom continued in a distracted state till after the death of Mary, whose life was sacrificed to the very great interest he felt in the welfare of his unhappy country. Morton then became regent; he, having always favoured Elizabeth's party, soon brought the Scottish nobles into a state of submission; and Eng-

land was no longer troubled with its cabals. The treachery of Morton delivered the chivalrous earl of Northumberland into the power of the English ministry; he was beheaded at York for his services to the unfortunate Mary, who thus saw herself bereft of all her most active friends.

In 1584 Sir Drew Drury and Sir Amias Pawlet were appointed gaolers to Mary, and there is no doubt but what one at least of these individuals were commissioned to destroy the queen privately.

"My answer," wrote Sir Amias Pawlet, "I shall deliver unto you with great grief and bitterness of mind, in that I am so unhappy as living to see this unhappy day, in which I am required, by direction from my most gracious sovereign to do an act which God and the law forbiddeth. God forbid I should make so foul a wreck of my conscience, or leave so great a blot to my poor posterity, and shed blood without law or warrant." It was then resolved to destroy the unfortunate queen under the forms of law. In 1585 the parliament passed an act declaring that "whosoever should endeavour to raise a rebellion in the kingdom, or attempt the queen's life, or claimed any right to the crown of England," should be tried by a commission appointed by the queen, and, if found guilty, put to death. It was well understood by every body at the time, that this act was expressly levelled against the queen of Scots. Accordingly, after her papers had been seized, and she had been removed to Fotheringay Castle, on the 25th of September, 1586, forty-two commissioners, with five judges of the realm, were appointed by letters patent under the great seal, on the authority of this act, to meet at the latter place to try her on the charge of having been a party to the conspiracy of Antony Babington and his confederates, who, to the number of fourteen, had just been executed for a plot against the queen's life. Thirty-six of the commissioners assembled on the 11th of October, and after various adjournments, pronounced sentence on the 25th, in the Star Chamber at Westminster, against the accused. This trial exhibited perhaps as extraordinary an accumulation of substantial injustice and oppression as was ever witnessed. It was the fit conclusion of an illegal and tyrannical imprisonment of twenty years. Not being a subject of the English crown, Mary could not be brought to trial on the existing statute of treasons. But just as little surely could she, except by the most outrageous defiance of all reason, be made amenable to the provisions of a new act specially framed to comprehend her case, while she was detained a prisoner in the country by force. Among the most active of her judges were Elizabeth's ministers themselves, Lord Burleigh, Sir Francis Walsingham, and others, the very men who had been labouring for years to effect her destruction, and who, at all events, were the acknowledged originators and directors of the present proceedings. It was not even pretended that any of her jury were her peers. She was allowed no counsel. The letters and other papers, forming the principal evidence upon which she was convicted, were not only all of them the compositions of others, but were not even originals. Of the witnesses, some, such as Babington, had been previously put to death, merely the testimony which had been extracted from them before they suffered being exhibited; others, such as her secretaries, Naue and Curl, although alive, were never confronted with her—their written depositions only

being produced. Having obtained her easy object by the verdict of the commissioners, Elizabeth thought it necessary to go through a melancholy farce of dissimulation, without a parallel for elaborate and at the same time transparent artifice. At last, in the midst of her hypocritical lamentations, she affixed her signature to the warrant of execution. She could not at the moment conceal the exultation with which her heart was palpitating. "Go," she said, jestingly to Davison, as she delivered him the fatal document, "tell this to Walsingham" (who was then sick), "though I fear he will die for sorrow when he hears it." She afterwards pretended that the execution took place contrary to her intentions; and Davison, whom she and her advisers had made their instrument, suffered severely for the part which he had been befooled to play.

Mary was executed at Fotheringay on the 8th of February, 1587, and the malice of her enemies pursued her even to the place of execution, as she was not permitted to have a minister of her own communion in the last solemn hour. Her remains were in the first instance interred at Peterborough cathedral, but her body was afterwards removed by her pusillanimous son to Henry the Seventh's chapel in Westminster Abbey.

MARY OF MEDICI, a daughter of Francis II. of Medici, grand-duke of Tuscany, who was born at Florence in 1573, and married to Henry IV., king of France, in 1600. After his death in 1610 she became regent. Mary, at the same time regent and guardian of her minor son, Louis XIII., dismissed the great minister, Sully, and allowed herself to be guided by Italian and Spanish favourites. The state lost its respect abroad, and was torn by the dissensions of the great within. A treaty, concluded in 1614, granted to the malcontents every thing which they had asked for; but party spirit arose anew, as Mary's conduct caused universal dissatisfaction, she having given herself totally up to the guidance of the marshal d'Ancre and his wife, the two most shameless favourites that ever stood near a throne.

The death of d'Ancre, murdered by order of Louis XIII., put an end to the civil war, and Mary was banished to Blois, whence she proceeded to Angoulême. Richelieu, then bishop of Luçon, reconciled the mother and son in 1619, but Mary, dissatisfied with the non-fulfilment of the terms of the agreement, kindled a new war, which however was soon subdued. After the death of the connétable de Luynes, her enemy, Mary stood at the head of the council of state. In order to strengthen her authority she introduced Richelieu, her favourite, into the council; but hardly had the cardinal reached the summit of his greatness when he made his former protectress sensible that he was no longer dependent upon her, and she immediately laboured to effect his downfall. Louis XIII. having fallen seriously sick at Lyons, she obliged him to promise to abandon the cardinal. In order to avoid the fulfilment of this promise, the king endeavoured to reconcile the two parties after his recovery. Mary was not to be moved, and the king was so much displeased that he consented to sacrifice her. A secret council of state was held, the chief mover of which was the cardinal, who showed in a long speech that either the queen or he himself must be sacrificed. He then set forth the dangers which threatened the state from without and within so forcibly, that the king held himself lost without the support of its

prime minister. All the other members of the council of state agreed with the king, partly from flattery, partly from fear of opposing him, partly from the wretched state of the kingdom. The king was apprehensive, in consequence of the suggestion of the cardinal, that the queen intended to put her second son Gaston on the throne. The queen therefore received orders in 1631 to retire for life to the castle of Compiègne, and all her adherents were either banished or confined in the Bastille.

**MEADOWCOURT, RICHARD**, an English critic, who was born in Staffordshire in 1697, and educated at Oxford. He is best known as the author of "Notes and Commentaries on Milton's *Paradise Regained*." He was also author of several small tracts containing critical remarks on the English poets; and his notes were not neglected by Bishop Newton, in publishing his edition of Milton. He died at Worcester in 1769. Dr. Newton thus speaks of him in his preface to the '*Paradise Regained*.' After enumerating the assistance given by friends, he adds, "I had the honour of all these for my associates and assistants before, but I have been farther strengthened by some new recruits, which were the more unexpected, as they were sent me by gentlemen with whom I never had the pleasure of a personal acquaintance. The Rev. Mr. Meadowcourt, canon of Worcester, in 1732 published a critical dissertation with notes, upon the '*Paradise Regained*,' a second edition of which was published in 1748; and he likewise transmitted to me a sheet of his manuscript remarks, wherein he hath happily explained a most difficult passage in '*Lycidas*,' better than any man had done before him."

**MECHELN, or MECKENEN, ISRAEL OF**.—There were two artists of this name, father and son, the former of whom appears to have been a painter, the latter a goldsmith, and one of the earliest and most distinguished engravers. They lived between 1450 and 1503. The son was born at Mecheln, near Bocholt. From his drawing we may conjecture that he was a scholar of Van Eyk. Of the circumstances of his life, little else is known than that he lived during his latter years at Bocholt, and died there in 1503. His engravings are rare and much sought after; yet they bear the marks of a rude taste and imperfect drawing, incorrect perspective, and other traits which characterise the period. They are chiefly valuable for the minute accuracy of their execution, and as monuments of the history of the art.

**MECKEL, JOHN FREDERIC**, a German practitioner, who rendered much service to anatomy and medicine. He was born at Halle in 1781. His grandfather, John Frederic Meckel, who died in 1774, acquired the reputation of one of the first anatomists, by several treatises in the Transactions of the academy of Berlin, especially by his dissertation, "*De Quinto Pare Nervorum Cerebri*." His father, Philip Frederic Meckel, who died in 1803, was professor of surgery and midwifery at Halle, and united the reputation of a scientific teacher with that of a popular and successful practitioner. The son, after making himself known as a scion worthy of his family by his inaugural dissertation, "*De Conditionibus Cordis Abnormibus*," undertook a course of scientific travels through Germany, Italy, and France. He prosecuted chiefly the study of comparative anatomy, for which he has unquestionably done more than any of his countrymen. In his translation of "Cuvier's

*Comparative Anatomy*," he embodied in notes and observations a mass of most valuable information. His "*Contributions to Comparative Anatomy*" soon followed, rich in original and sagacious views; after which he began his "*System of Comparative Anatomy*." His "*Manual of Pathological Anatomy*," his "*Manual of Human Anatomy*," the "*Tabulæ Anatomico-Pathologicæ*," the "*Descriptio Monstrorum*," all bear witness of the most laborious investigation and deep insight into the laws of life. An idea principally formed and practically illustrated by him with success is, that the human organization is developed in its formation by degrees, and these gradations correspond to the permanent forms of the different kinds of animals; and in monstrous births are merely formations whose developement has ceased prematurely. His anatomical museum is unique among private collections of its kind in Germany. It was founded by his grandfather and enlarged by his father, and M. Meckel was continually enriching it with invaluable additions, especially for comparative anatomy.

**MEDE, JOSEPH**, an English divine and writer, who was born at Berden in Essex, in 1586, and educated at Christ college, Cambridge, where he took his degree in 1610. He is best known as an author for his work entitled "*Clavis Apocalyptica*," which is considered by biblical critics as the ablest explanation of the obscure prophecies to which it refers. He died in 1638.

**MEDICI**.—It is not uncommon for families from the common ranks of society to attain to great opulence by industry and good fortune. But wealth imparts influence, and this rank and distinction. In democratic states then, it is not wonderful that we find families of originally little importance after some generations appearing among the rulers of the state, and even at the head of it. The histories of the Grecian and Italian republics are full of such examples. But owing to the fluctuating nature of wealth and popular favour, such houses generally decline as rapidly as they rose into consequence. If, therefore, a family from the class of commoners flourishes for centuries amidst the continual vicissitudes of conflicting parties, if its influence during this time gradually becomes supreme, and it maintains this power for centuries, we can confidently conclude that the heads of the family must have been distinguished for wisdom and good fortune. Such is the case with the family of the Medici. The Medici, when they first appeared in Florentine history, in the beginning of the fourteenth century, were already rich and important, having recently acquired affluence by commerce. Corso Donato, the head of the party of the Neri, had expelled the Bianchi from Florence, but found himself neglected by his former friends, the chiefs of the nobility; he therefore attached himself, for the purpose of forming a new party, to some wealthy families belonging to the commoners. Among these the Medici are the first named, although, according to some, they were in favour of the recall of the banished Bianchi. However that may be, they conducted themselves with so much sagacity that they soon became one of those families from which the popular oligarchy of Florence was composed. They principally contributed to the elevation of Walter of Brienne, duke of Athens, to the head of the state, who, however, made use of his power to humble the ruling families, and caused Giovanni de' Medici, who had

not defended Lucca against the Pisans with sufficient firmness, to be beheaded. The Medici, therefore, with some other families, entered into a conspiracy against him, which was discovered to him by Matteo di Marozzo; but, fortunately for the Medici, the tyrannical duke, in a fit of caprice to appear magnanimous, did not investigate the case. This proved his ruin; for when the dissatisfaction at last broke out into open rebellion, the Medici were among the leaders.

After the banishment of the duke the old nobility were again admitted to participate in the government, from which they had been excluded for fifty years; but abusing their new liberty they were guilty of such violence and excesses, that Alamanno de' Medici, the oldest of the family, called the people to arms and drove out the nobles. During the next ten years, when Florence was disturbed anew by the Ricci and Albizzi factions, and distracted by the Ammonizioni (as the exclusion of certain individuals and families from public honours under the pretence of Ghibelism was called), the Medici joined the Ricci, which was the weaker party. A son of Alamanno, named Bartholomew, entered into a conspiracy against Albizzi about the year 1360, but escaped on its discovery from the fate of his accomplices, by placing himself in time under the protection of his brother Salvestro, who was a magistrate. Salvestro himself, when gonfalonier of justice in 1378, procured a law by which the Albizzi were humbled and the Ammonizioni were moderated. The party of the Albizzi being afterwards wholly annihilated, and the popular party having gained the supremacy, Salvestro attained the great distinction which laid the foundation for the future influence of his house. The moderation of Salvestro and his family preserved them from falling, even when, a few years later, the party which had elevated him prepared its own ruin by its arrogance. Thus the Medici, undisturbed in their greatness and affluence, saw the Albizzi, Strozzi, Scali, Alberti, fall around them; for they did not, like the latter, aspire to the supreme power of the state. Yet they also, at least for a period, became the victims of republican party spirit. In an insurrection of the people against the principal citizens and the revived party of the Albizzi in 1393, the furious populace obliged Veri de' Medici, Salvestro's son, and at that time head of the family, to be their leader, and to compel the signoria to grant their demands. Veri might easily have then become the master of Florence; but he made use of his influence with the people only as a mediator, and calmed the disturbance. But the signoria failing to fulfil their promises to the people, he and his adherents loudly expressed their dissatisfaction.

The government shortly after took advantage of some threats uttered by a friend of the Medici, to banish all those members of the family who were lineally descended from Salvestro with their friends. Some of these exiles, and among them Antonio, in concert with their friends in Florence, attempted in 1397 to return and seize the government. They forced their way into the city, but found no assistance, and were obliged to take refuge in the church S. Reparata, where a part of them were killed and a part made prisoners and executed. After the detection of another conspiracy, excited by the duke of Milan in 1400, among the Florentine exiles in Lombardy, and in which inhabitants of Florence were to have co-operated, the Medici were again banished,

with the exception of a few. But these few, who continued to enrich themselves by successful commerce, restored the distinction of their house on a firmer basis. Giovanni de' Medici was in 1402, 1408, and 1417, member of the signoria; in 1414 belonged to the council of the Ten, and, finally, when the ruling aristocracy was convinced of his moderation and of his impartiality, became in September and October, 1421, gonfalonier of justice. The people vainly expected from him the formation of an opposition party, which he was too prudent to attempt; on the other hand he was honestly devoted to the Albizzi. He died in 1429. Of his sons, Cosimo Cosmo, and Lorenzo, the former begins the splendid series of the celebrated Medici; the latter was the ancestor of the grand-duke of Tuscany. Cosmo had already a seat in the signoria in 1416; and, though he made little direct opposition to the ruling party, yet the great liberality which his immense wealth allowed him to exercise, collected a numerous party around him, which, envious of the Albizzi, neglected no means to weaken them. This does not indeed appear to have been effected by the instigation of Cosmo, and his party was not even called after him, but after a certain Puccio Pucci, who, with Averardo de' Medici, was most zealous to gain him partisans; yet he was considered by the Albizzi the chief of the party, and their most dangerous enemy. He was finally seized and imprisoned without being proved guilty of any crime except his popular affability, and succeeded only by bribing the gonfalonier, Bernardo Guadagni, in having the sentence of death, which was preparing for him by Rinaldo Albizzi, converted into banishment to Padua, in 1433. Yet his friends were so numerous that a year after a signoria, which consisted wholly of them, recalled Cosmo and banished Rinaldo and his adherents. By this victory the party of the Medici acquired the ascendancy.

Nevertheless, Cosmo scorned to use force against his enemies; but some suspected persons were banished in 1442. Neri Capponi endeavoured to oppose the policy of Cosmo, who was a friend of Francesco Sforza. But Cosmo was contented with protecting himself against his enemies by the number of his friends, and was able to check the arrogance of the latter, which he most feared, by inspiring them with a dread of the former. The ruling party in Florence was accustomed to obtain for some of their number, from the people, the grant of full powers, or *balia*, to appoint the magistrates for some years. Cosmo himself caused Neri to be appointed one of these commissioners, and thus attached him to his own party, which hazarded nothing in receiving the weaker one of Neri. When, after the death of Neri, the term of the *balia* was expired, he did not make use of his power to effect a prolongation of it, as heretofore some less sagacious chiefs had done, but waited quietly until the great mass of those who vainly expected honours from the people, but might have hopes of receiving them from him, effected the renewal of the former oligarchy for eight years in 1458. Indeed it was always his policy to let others work for his advantage, while he remained in apparent indifference and inactivity himself. As Puccio Pucci was formerly called the head of his party, so at present Cosmo ruled the republic from 1458 through Luca Pitti, he himself remaining in the back ground. From thence he observed his friends and his enemies, and endeavoured to keep the former within the

bounds of moderation, which are essential to the existence of a constitutional aristocracy, and much more to that of an insecure oligarchy.

He was less successful in this, in his later years, particularly on account of the imperious character of Luca Pitti. He therefore laid it down as a rule never to distinguish himself in his mode of living by expense or by a splendour that would excite envy. His superfluous wealth he expended upon public buildings, with which he adorned Florence, and in a splendid munificence, not only towards his adherents, but especially towards artists and learned men; among whom Argyropylus, Marcilius Ficinus, &c., enjoyed a liberal share of his favours; for he himself was a cultivated and accomplished friend to science, without being a less active merchant, or a less sagacious statesman. It would have been easy for him, who in Europe was considered as the prince of Florence, to ally himself with princes; but he married his sons and his grand-daughters to the daughters and sons of Florentine citizens. With equal wisdom he managed the foreign affairs of the republic, in its difficult relations with Naples, Milan and Venice, in which his commercial connexions with all countries and his vast credit firmly supported him.

After Cosmo had done every thing which he could to establish his house in the popular favour, he died in 1464, with anxious thoughts respecting the future; for his kinsman, the sagacious Bernardo de' Medici, who had gained so much honour in the war against Milan and Naples, and his son Giovanni, had both died before him; his other son, Piero, on account of his ill health, seemed little capable of being at the head of the state; the sons of Piero, Giuliano and Lorenzo, were still minors. Piero, in the commencement of his course, lost much of the favour which the Florentines would readily have transferred to him from his father, in consequence of following the evil suggestion of a false friend, Diotisalvi Neroni, who advised him, in order to restore his finances, which had suffered from the munificence of his father, to exact the payment of many sums of money, which his father had lent to citizens. The growing dislike of the people towards him on account of this measure, and also the betrothment of his son Lorenzo with Clarice (of the noble house of Orsini), were eagerly taken advantage of by Neroni and the ambitious Luca Pitti, in conjunction with the true patriot Nicolo Soderini, and Agnolo Acciajuoli, the personal enemy of the Medici, to effect his downfall. They prepared a list of names personally subscribed by the enemies of the Medici. Piero, to whom this was made known, procured a similar list of the names of his friends and partisans, which many subscribed under the influence of fear, who had already enrolled themselves among his adversaries. After unsuccessful attempts, by moderate measures, to change the government, the malcontents resolved to put Piero to death in his own house at Carreggi, and to take possession of the government, with the assistance of the marquis of Ferrara. But the design was revealed to Piero, upon which in August 1466, with a numerous body of armed men, he went to Florence. Guarded by these, he kept quietly in his own house. His enemies also armed themselves, but were discouraged by the defection of Luca Pitti. Piero having professed his moderation to a deputation of eminent citizens, and declared that he did not desire the renewal of the expired *balia*, the people would un-

dertake nothing against him; his enemies therefore dispersed, and their leaders fled from Florence. The *balia* was then renewed to the party of the Medici, and they became from this time supreme. But the other members of the *balia* abused this power in the most arbitrary manner, and Piero, being almost constantly confined to his bed, was unable to prevent them; he was, therefore, on the point of recalling his banished enemies, in order, by their means, to check the violence of his friends, when death prevented him in 1469. The secret enemies of the Medici, on account of the youth and inexperience of his sons, Lorenzo and Giuliano, thought the time favourable for a new attempt to overthrow that powerful house. In conjunction with Pope Sextus IV. and the archbishop of Pisa, Francesco Salviati, and the Pazzi, the family next in consequence to the Medici, formed the plan of an assault on Lorenzo and Giuliano, which, after many disappointments, was carried into execution on the 26th of April, 1478, in the church S. Reparata. They failed, indeed, in their attempt on Lorenzo; but Giuliano was murdered.

The people immediately armed themselves in the cause of the beloved Medici; his assassins were put to death, and the house of Pazzi was overthrown.

Lorenzo, now the only head of his house, and more than ever confirmed in the government of the republic, ruled it in a manner worthy of his grandfather, whom he surpassed in wisdom and moderation, as in magnanimity and munificence; but particularly in his active zeal for the arts and sciences, and by alliances with Venice and Milan, he protected Florence against the machinations of the pope and the king of Naples. He then made a journey to Naples, and induced the king, the bitterest enemy of himself and his country, to become his warmest friend, and an ally against the attacks of the implacable pope and the faithless Venetians. By his honourable and wise policy he placed the balance of power in Italy on a footing, which, until his death, ensured to her full security and ample scope to extend and confirm her prosperity. Great losses induced him to give up commerce, which the Medici

had always carried on, though, indeed, by agents who were frequently treacherous or inefficient. These losses had reduced him to such a want of money, that he was often compelled to borrow large sums from the public treasury; yet, when he withdrew his property from trade, he was sufficiently wealthy to purchase princely domains, and not only to adorn them with palaces of regal splendour, but also to ornament Florence with elegant edifices. In the long peace, which his wisdom procured for the republic, he entertained the Florentines with elegant and splendid festivals, himself with the society of the most distinguished literati of his age, whom (as, for instance, Demetrius Chalcondylas, Agnolo da Montepulciano, Christopher Landini, and, above all, the great John Pico of Mirandola) his fame and his invitation had attracted to Florence, and his princely munificence rewarded. He increased the medicean library, so rich in manuscripts, founded by Cosmo in 1471. He also opened a school for the fine arts, in a palace adorned with ancient statues and excellent paintings. All, who in this age had gained a reputation in Florence for great talents, shared his patronage. Lorenzo was therefore surnamed the Magnificent. Honoured by all the princes of Europe, beloved by his fellow-citizens, he died in 1492, and with him the glory of his country. The works of Lorenzo de' Medici were published at Florence in 1826, in a splendid edition, at the expense of the grand-duke, Leopold II., and contain the first complete collection of his poems.

Prefixed to his amatory poetry is his celebrated "Theory of Love;" which, next to that of Shakespeare, is one of the most perfect conceptions of that passion. He says, "With justice might I be blamed, had I been so richly gifted by nature as to make it easy for me to perform every action in a perfect manner; but this pre-eminence has been granted to very few, and even to these only on very rare occasions during their lives: whence, upon considering the frailty of humanity, and being bound for safety's sake to confine ourselves to the common condition of mankind, and the constant practice of the world, I think those actions are to be preferred which give rise to the fewest evils. Now love is so far from being reprehensible, that, on the contrary, it is the surest indication of a noble and lofty mind; and a special cause that allures and excites men to the active practice of the virtues which dwell in the soul. Whoever seeks for the true definition of love, discovers it to be only—a desire of the beautiful. And if this be the case, vice and deformity, in every shape, must be disgusting to him who truly loves. Beauty of countenance and mind is the principle and guide which leads man to seek for beauty in other objects, to mount up to virtue, which is beauty half earthly, half divine, and come at last to repose in the sovereign beauty, that is, God.

"The conditions which appear necessarily to belong to a true, exalted, and worthy love, are two:—First, To love but one—Second, To love this one always. Not many lovers have hearts so generous as to be capable of fulfilling these two conditions; and exceedingly few women display sufficient attractives to withhold men from the violation of them; yet without these there is no true love. For, in addition to natural charms, there must be found in the person beloved, talent, accomplishments, propriety of behaviour, elegant manners, a graceful presence, suavity of speech,

good sense, love, constancy, and fidelity. Beauty and the eyes first give birth to love; but other endowments are necessary for its preservation. Because, should sickness, or other accidents, discolour the cheek, or early beauty fade away in age, the gifts of mind remain and are not less dear to the heart than beauty to the eye and pleasure to the senses. The senses, it is true, open the door to love, but afterwards the soul must cherish it like a hallowed fire, must refine and purify it by degrees, and feed on it. And yet these estimable qualities may not be enough, unless the lover possess sensibility of heart to discern them, and elevation and generosity of soul to appreciate them. But when the above-mentioned conditions meet in two enamoured persons—she becomes more beautiful of soul, more wise, more happy in her affections—and he, to please her ever more and more, must, in all his actions, endeavour to excel in virtue, and beautify his soul, that he may emulate the moral and corporeal graces of his mistress."

Lorenzo left three sons, Piero, married to Alfonsina Orsini; Giovanni, afterwards Pope Leo X.; and Giuliano, duke of Nemours. Piero, the new head of the state, was wholly unqualified for the place. In two years he had alienated the duke of Milan and the king of France from the republic, and, by his imprudence and weakness, but particularly by the disgraceful peace of Serezna, had made himself despised and hated by the Florentines, who would willingly have honoured his great father in him. He was, in consequence, divested of the government, and banished with his whole family. After several attempts, by fraud or force, to return, Piero lost his life in 1504 in the battle of the Garigliano, being drowned in that river, where he was with the French army. In 1513 his brother the cardinal Giovanni, by an insurrection raised by the popular preacher Hieronymus Savonarola, obtained a re-establishment in his native city, and when he became pope in 1514 he elevated his family again to its pristine splendour. Piero's son, Lorenzo, created by the pope duke of Urbino, was the head of the state, though always without the princely title, and with the preservation of the republican forms. He died in 1519. Julius, a natural son of the Giuliano who was murdered in 1478, ascended the papal throne in 1523, under the title of Clement VII., and in 1533 Catharine, Lorenzo's daughter, became the wife of Henry II., king of France; after which events the speedy dissolution of the semblance of liberty at Florence was readily foreseen. The Florentines, indeed, seemed on the point of recovering their ancient freedom, when they banished, in 1527, the vicious Alessandro; but this was the last ebullition of republican spirit. At the persuasion of Clement VII., Charles V. besieged Florence in 1531, and after its capture reinstated Alessandro, made him duke of Florence, and gave him his natural daughter, Margaret, in marriage. At first the nation loved him for his affability; but finally he gave himself up to a licentious course of life. He was the first independent duke of Florence. When Alexander, the last descendant of the great Cosmo, had been murdered by Lorenzo de' Medici, who was a lineal descendant from Cosmo's brother Lorenzo, in 1537, the Florentines made a weak attempt to reestablish the republic; but Charles V. again attacked them, and his power promoted Cosmo I. (who belonged to another branch) to the dukedom of Florence.

Cosmo I. possessed, as did his successors, the art, but not the virtues, of the great Medici to whom he owed his power. To confirm his greatness, he made it his chief object to exterminate the Strozzi, the hereditary enemies of his house, in 1554; and to protect the commerce of the Levant against the Turks, he founded a new religious order, that of St. Stephen. He was a great amateur and collector of antiquities and pictures, and founded the extensive collection of statues of celebrated men, and constantly increased the collection of statues in the garden of Lorenzo the Magnificent. The foundation of the Florentine academy, and of the academy of design in 1562, is due to him. After he had made himself master of Sienna, with the assistance of Spain, in 1557, and by several other acquisitions had extended the dominions of Florence, he obtained from Pope Pius V. the title of grand-duke of Tuscany; but his son and successor, Francis, first procured from the emperor, Maximilian II., whose sister Joanna he married, the confirmation of this title in 1575, for a large sum of money. Francis's second wife, the celebrated Venetian, Bianca Capello, was declared, by the senate of her country, daughter of the republic, in order to make her worthy of this alliance. His daughter Maria became the wife of Henry IV. of France. This branch of the Medici had not, like that which became extinct with Alessandro, given up commerce; even when princes, Cosmo I., Francis, and his brother Ferdinand I., at that time cardinal, who succeeded him, likewise an ardent lover of the arts, as also Cosmo II., the son of the last, continued engaged in it, and Francis even continued the retail traffic which Ferdinand gave up. Under these grand-dukes the arts and sciences flourished at Florence, and, in this circumstance, as well as in the artful policy of the government (especially in the delicate situation of affairs between France and Spain), was recognised the spirit of the great Medici of the fifteenth century.

But the state of things was changed under Ferdinand II., son of Cosmo II., who in 1621 came to the government at the age of eleven years. During his minority the clergy, and through it the papal see, acquired a very pernicious influence in the administration, and persuaded him, contrary to the policy of his father, to throw himself into the arms of Spain and Austria—an alliance made use of by these courts to drain immense sums of money from the treasury of the Medici, which was thought to be inexhaustible. He governed forty-nine years, and his son, Cosmo III., austere brought up, and destitute of all political capacity, fifty-three years, from 1670 to 1723—a century in which Tuscany was reduced to the most deplorable state by an enormous national debt, and by an exhaustion of all the sources of national wealth. Fortunately for the country, John Gasto, son of Cosmo III., was the last of his family, once so glorious, but now degenerated beyond hope of recovery. He died in 1737, after an inefficient reign, and, in compliance with the terms of the peace of Vienna, left his duchy to the house of Lorraine. Francis Stephen, duke of Lorraine and grand-duke of Tuscany, afterwards the emperor Francis I., made a contract with the sister of John Gasto, the widowed electress of the palatinate, the last of the name of Medici, by which he acquired the various allodial possessions of her house, and also the celebrated works of art and antiquities collected by her ancestors. Under the twenty-six years' reign of his son, the wise and virtuous Leopold, Tus-

cany recovered from a decline that had lasted for more than a century.

MEDICI, LUIGI, DON, was a descendant from the ducal house of Ottojano. He was the favourite minister of the king of Naples, and succeeded Acton, and rendered considerable service by improving the state of the finances. During the reign of Joseph Bonaparte and Joachim Murat he resided in England, and returned with the Bourbons to Naples, where he was minister of the police, when Murat, induced by false reports, purposely spread in order to lead him to his ruin, passed from Corsica to the Neapolitan territory. Medici ordered the coasts to be watched, and Murat was taken and shot. In 1818 Medici concluded a concordate with the pope, and in 1819 the king, on his proposal, ordered "that all judges should decide causes according to the literal meaning of the laws, and, wherever this was not clear, should follow reasonable interpretations, and not the commentaries of jurisconsults; after which, the reasons of the sentences should be printed." To clear the prisons, filled with captive robbers, Medici sent 2000 criminals to Brazil, according to a treaty concluded with the court of Rio Janeiro. Yet his administration, particularly the re-establishment of convents in 1819, met with much censure. The people were dissatisfied with the new tax on landed property, and the revolution broke out at Nola in July 1820. The ministry of the police had previously been given to the prince of Canosa, who, unlike Medici, united with the secret society of the *Calderari*, in order to suppress the *Carbonari*, whilst Medici had sent the most ardent members of these societies to the insane hospital. Medici gave in his resignation and retired to Rome, where he remained for some time after the return of the king of Naples. But when the violent measures of the prince of Canosa appeared to be ill adapted to restore order, the king, on the advice of Austria, resolved to form a new ministry, the president of which was Prince Alvaro Ruffo, and the finances were once more given to Medici; milder measures were now adopted, and to cover the deficit in the revenue a loan had been contracted with the house of Rothschild. When the king, with Prince Ruffo, went to the congress of Verona, and afterwards to Vienna, Medici was appointed president of the council of ministers. He saw himself obliged to contract a new loan with the house of Rothschild for two millions and a half pounds sterling, for which, customs and other indirect taxes were pledged. Under the reign of Francis I., Medici retained his high post. He went with his king to Madrid, and is said to have been consulted respecting the regulation of the embarrassed finances of Spain. He died in 1830.

MEHUL, STEPHEN HENRY, a celebrated musical composer, and member of the institute of France, who was born at Givet in 1763, and received his first lessons from a blind organist at his native place, where he became such a proficient that, at the age of twelve, he was appointed joint organist to the abbey of Valledieu. The desire of improving his talents attracted him to Paris in 1779. He there studied under Edelmann, and, afterwards, under Gluck; and, after the departure of the latter for Vienna, Méhul presented to the royal academy of music the opera of "*Cora and Alonzo*;" but his "*Euphrosine and Coradin*" was first performed at the comic opera in 1790. This was followed, at different periods, by "*Stratonice*," "*Irato*," "*Joseph*," and

many other operas, besides the ballets of "The Judgment of Paris," "Dansomanie," and "Pereus and Andromeda." Méhul was one of the three inspectors of instruction at the conservatory of music, from its creation in 1795 till its suppression in 1815. He was then appointed superintendent of music at the king's chapel, and professor of composition at the royal school of music. He was chosen a member of the institute and of the academy of fine arts, and was also a knight of the legion of honour. He died at Paris in 1817. Méhul read before the institute two reports, "Sur l'Etat Actuel de la Musique en France," and "Sur les Travaux des Elèves du Conservatoire à Rome."

**MEIBOM, JOHN HENRY**, a celebrated physician, who was a native of Helmstädt, where he was born in 1590. After travelling in Italy, and taking his doctor's degree at Basle, he returned home, and occupied a medical chair in the university of Helmstädt. In 1626 he was appointed physician of Lubeck, where he died in 1655. His principal works are, "Aurelii Cassiodori Formula Comitum Archiatrorum;" "De Usu Flagrorum in Re Medica et Venerea;" "Jusjurandum Hippocratis," with commentaries relative to the history of Hippocrates, his disciples, &c. After his death appeared his treatise, "De Cerevisiis, Potibusque et Ebriaminibus extra Vinum Aliis."

His son, Henry Meibom, also a physician, was born at Lubeck in 1638, and became professor of medicine in the university of Helmstädt. In 1678 he was made professor of poetry and history. He was the author of numerous medical and anatomical dissertations, and distinguished himself by his investigation of the sebaceous glands and ducts in the eyelids, the valves of the veins, and the papillæ of the tongue. His principal historical publication, "Rerum Germanicarum Tomi Tres," is a collection of writers on German history. He also wrote many pieces concerning the dukes of Brunswick and Lüneburg, and in 1687 he published "Ad Saxonie Inferioris Historiam Introductio." Henry Meibom died in 1700.

**MEIBOMIUS, MARCUS**, a learned philologist, born at Tönningen, in the duchy of Holstein, in 1630. Settling at Stockholm, he acquired the favour of Queen Christina, whom he inspired with much of the same enthusiasm, with respect to the ancients, which possessed himself. Having prevailed upon his royal mistress to be present at a concert, which he proposed to conduct entirely upon the plan of the ancient Greeks, and at which Professor Naudaus was to dance a Greek dance, the ridicule of some of the courtiers at the absurdity of the performance excited his anger so violently that, forgetful of the presence of the sovereign, he struck M. Bordelot, a physician, who, as he fancied, encouraged it, a violent blow in the face. This indiscretion induced him to quit Sweden for Denmark, where he obtained a professorship in the college established for the education of the young nobility at Sorø, was eventually advanced to the rank of a royal counsellor, and made president of the customs. His inattention to the duties of his post soon caused his removal, on which he repaired to Amsterdam, and became historical professor there, but lost this appointment also by his petulance in refusing to give lessons to the son of one of the principal burgomasters. After visiting France and England, Meibomius returned to Amsterdam, and died

there in 1711. His principal work is an edition of the seven Greek musical writers, Aristoxenus, Euclid, Nicomachus, Alypius, Gaudentius, Bacchius, and Aristides Quintilianus, with an appendix, containing the "De Musica" of Martianus Felix.

**MEINERS, CHRISTOPHER**, was born at Ottendorf, in the kingdom of Hanover, in 1747, studied at Gottingen from 1767, and afterwards became one of the most valuable teachers there. His works are very numerous, on various subjects, and of unequal merit. As an academical teacher, his activity in organizing and promoting the prosperity of his university was untiring, and it is much to be regretted that his history of the university was left incomplete. His favourite study was the history of human civilization, and particularly of religion, to which some of his earliest writings, among them his "Historia Doctrinæ de Deo Vero," relate. His latest work on this subject, "Allgemeine Kritische Geschichte der Religion," is, however, more defective in acuteness of criticism and clearness of arrangement than his previous writings. Some of his earlier treatises bear the impress of a judicious, calm, and independent thinker. From his writings on the middle ages, and particularly from his learned lives of the restorers of learning in the fifteenth and sixteenth centuries, a new Bayle may find materials for attack and defence. A French translation of his "History of the Origin, Progress, and Decline of Learning in Greece and Rome," procured his election into the national institute. He died in 1810.

**MEISSNER, AUGUSTUS GOTTLIEB**.—This talented writer was born at Bautzen in 1753, studied law and the belles-lettres at Leipsic and Wittenberg, and died at Fulda, where he was director of the high seminaries of education in 1807. He was also for some time professor of æsthetics and classical literature at Prague. His works were, at one period, very popular in Germany. A glowing imagination, an easy style, grace, wit, and a brilliant manner, united with a delicate tone of gallantry, were the causes of his success. His principal productions are comic operas in the French style; sketches, a miscellaneous collection of anecdotes, tales, &c.; several historical romances, as "Alcibiades," "Bianca Cappello," &c. He also translated Hume's "History of England."

**MELA, POMPONIUS**, a geographer, who flourished during the first century of the Christian era. Little more is known of him than that he was a native of Spain, and the author of a treatise, in three books, in the Latin language, "De Situ Orbis," containing a concise view of the state of the world so far as it was known to the ancient Romans.

**MELANCTHON, PHILIP**.—This learned divine was Luther's fellow labourer in the reformation. He was born in 1497 at Bretten, in the palatinate of the Rhine, where his father, George Schwartzerd, was keeper of the armoury of the count palatine, and died in 1507, and his mother Barbara was a near relative of the learned Reuchlin. His rapid progress in the ancient languages during his boyhood made him a peculiar favourite with Reuchlin. And by his advice he changed his name, according to the custom of the learned at that time, from Schwartzerd Black-earth into the Greek name Melancthon, of the same signification, and in 1510 went to the university of Heidelberg. There he was pre-eminent in philological and philosophical studies, so that in the following

year he was deemed qualified for the degree of bachelor of philosophy, and was made instructor of some young noblemen. But as this university denied him the dignity of master on account of his youth, he went to Tübingen in 1512, where, in addition to his former studies, he devoted himself particularly to theology, and in 1514, after obtaining the degree of master, delivered lectures on the Greek and Latin authors. His profound knowledge is proved by a Greek grammar, which he published about this time. The ability of his lectures soon gained him universal esteem, and the great Erasmus himself gave him, in 1518, the praise of uncommon research, correct knowledge of classical antiquity, and of an eloquent style. Tübingen had to lament the loss of its chief ornament when Melancthon, being invited, on Reuchlin's recommendation to Wittenberg, appeared in 1518 at that university, in his twenty-second year, as professor of the Greek language and literature.

His enlightened mind soon decided him in favour of the cause of evangelical truth; and his judgment, ripened by classical study, his acumen as a philosopher and critic, the uncommon distinctness and order of his ideas, which spread light and grace over whatever he discussed, the caution with which he advanced from doubt to certainty, and the steadfast zeal with which he held and defended the truth when found, this combination of great qualities and merits, at all times rare, contributed greatly to the progress and success of the reformation, in connexion with Luther's activity, spirit, and enterprise. Melancthon's superiority as a scholar, his mild amiable character, the moderation and candour with which he treated the opposite party, made him peculiarly suitable for a mediator. No one knew better than he how to soften the rigour of Luther, and to recommend the new doctrines to those who were prepossessed against them. His "*Loci Theologici*," which appeared first in 1521, opened the path to an exposition of the Christian creed, at the same time scientific and intelligible, and became the model of all protestant writers of dogmatics. He urged decidedly, in 1529, the protest against the resolves of the diet of Spire, which gave his party its name. He drew up in 1530 the celebrated "*Confession of Augsburg*;" and this and the apology for it, which he composed soon after, carried the reputation of his name through all Europe. Francis I. invited him to France in 1535, with a view to a pacific conference with the doctors of the Sorbonne, and he soon after received a similar invitation to this country. Political reasons prevented him from accepting either of the invitations. He went to Worms in 1541, and soon after to Ratisbon, to defend the cause of the protestants in the conferences commenced there with the catholics. But while the reasonable part of the catholics learned on this occasion to respect him more highly, he had to endure from his own party bitter reproaches for the steps for effecting a compromise, upon which he had ventured after mature deliberation. The same thing happened to him when, having been invited to Bonn in 1543 by the elector Hermann of Cologne, he tried to introduce the elector's plans of reformation in a conciliatory spirit towards the catholics. Meanwhile, neither Luther, nor any other of his friends, who knew his noble heart and upright piety, ever entertained a doubt of the purity of his intentions or his fidelity to the gospel. Much as Melancthon had to suffer from Luther's vehemence, the friendship of these two noble spirited

men, agreeing in sentiment and belief, remained unbroken till Luther's death, whom Melancthon lamented with the feelings of a son. A great part of the confidence which Luther had enjoyed now fell to him. Germany had already called him her teacher, and Wittenberg revered in him its only support, and the restorer of its university, after the Smalcaldic war, during which he fled hither and thither and spent some time in Weimar. The new elector, Maurice, also treated him with distinction, and did nothing in religious matters without his advice. But some theologians who would fain have been the sole heirs of Luther's glory could not forgive him, nor believe that love to Wittenberg had induced him to submit to this prince, who had rendered himself suspected by the whole Lutheran church. They attacked his dogmas, and raised suspicions of his orthodoxy.

Melancthon had indeed shown in his negotiations with the catholics, that many an ancient usage, and even a conditional acknowledgment of the papal authority, did not seem to him so dangerous as to Luther. Moreover, the gradual approach of his views (respecting the presence of Christ in the supper) to the Swiss reformers was known, and the alteration which he had, in consequence, made in the article of the Augsburg Confession concerning the supper, was censured by friend and foe. He also explained the doctrine of justification more definitely, and, according to his convictions, more scripturally, both in the later editions of his "*Loci Theologici*," and in other public writings, and explicitly avowed his deviation from the Augustine system, by the assertion that the free will of man must and could co-operate in his improvement; as all will perceive who read his works with attention. His habit of continually advancing in his researches and correcting his opinions, had, unquestionably, a greater share in this change than his natural timidity and love of peace; although, from the last cause, he often used milder language than was agreeable to the rigid Lutherans; but that from fear of man, or a weak spirit of compliance, he ever yielded in any essential point of evangelical truth, cannot be maintained.

The introduction of the Augsburg Interim into Saxony, in which, after long deliberation, Melancthon acquiesced in 1549, under conditions which averted the danger of a relapse into ancient abuses, seemed to the more zealous the most fitting occasion of assailing him. The vexatious disputes respecting the greater or less importance of indifferent matters, considered in religious ceremonies, in which he was involved by Flacius; the complaints which Osiander urged against him in 1557 on account of his doctrine of justification; and, finally, the controversies respecting the co-operation of free will in man's improvement, in which Flacius engaged him shortly before his death, brought great trouble on his overlaboured and sensitive spirit. The investigation of his orthodoxy, which was instituted at Naumberg in 1554, resulted in his entire justification; but the reconciliation which took place there with his enemies, was, nevertheless, merely apparent; and their opposition frustrated the last attempt which he made in 1557 at a convention at Worms, in the name of his party, to produce a compromise with the catholics. The unity of the church was, therefore, Melancthon's last wish, when he died at Wittenberg, in April 1560. A son survived him, who inherited the virtues but not the genius of his father, and a

daughter, married at Wittenberg. His eldest daughter died in 1547; his wife in 1557. The over-anxious mind of this good and amiable woman had often saddened his domestic peace; but he was no where more amiable than in the bosom of his family. Modesty and humility were exhibited in his bodily appearance. No one who saw him for the first time would have recognised the great reformer, in his almost diminutive figure, which always continued meagre from his abstemiousness and industry. But his high, arched, and open forehead, and his bright, handsome eyes, announced the energetic, lively mind, which this light covering enclosed, and which lighted up his countenance when he spoke. In his conversation pleasantries were intermingled with the most sagacious remarks, and no one left him without having been instructed and pleased. He loved to see society at his table, and was so liberal towards the needy that he sometimes involved himself in embarrassments. His ready benevolence, which was the fundamental trait of his character, embraced all who approached him. Open and unsuspecting, he always spoke from the heart; piety, a dignified simplicity, and innocence of manners, generosity, and character, were to him so natural, that it was difficult for him to ascribe opposite qualities to any man; often deceived and abused he was long in learning the arts and ignoble passions which so often stood in the way of his best intentions. But this unsuspecting, benevolent character gained him the devoted love of his disciples. From all the countries of Europe students flocked to Wittenberg in order to assemble around him; and the spirit of profound and impartial investigation which he inculcated had a beneficial influence long after his death; and his exertions to promote education in general are never to be forgotten. If, therefore, stronger energies and greater deeds must be allowed to other distinguished men of his age, he will always be considered the most amiable, pure, and learned. We insert his autograph.

*philippus melancthon*

MELAS, an Austrian general, who in 1793 and 1794 was employed as major-general, and then as lieutenant field-marshal on the Sambre and in the country of Treves. In 1795 he was removed to the army of the Rhine, and in March 1796 to that of Italy, which he commanded for a short time, and afterwards served under different generals who succeeded him. In 1799 he was at the head of the Austrian army, which acted in concert with the Russians under Suwarrow. He distinguished himself at the battle of Cassano, was present at those of Trebia and Novi, beat Championnet at Genola, and took Coni. In 1800 he lost the battle of Marengo, and died in 1807.

MELCHTHAL, ARNOLD OF, was one of the founders of the freedom of Switzerland. The governor of the district, under Albert of Austria, having caused a yoke of oxen to be taken from the plough of Arnold's father, a rich proprietor, the menial of the tyrant added the words, "The peasants may drag the plough themselves if they want bread." Arnold, exasperated by the insult, wounded the servant and saved himself by flight; but his father experienced the vengeance of the governor, who deprived him of

sight. Arnold now conspired with two friends, Furst and Stauffacher, and all three bound themselves by an oath on the night of November 1307, at Grutlin, on the banks of the lake of Waldstetter, to effect the deliverance of their country. They promised each in his own canton to defend the cause of the people, and, with the assistance of the communes, to restore it at every sacrifice to the enjoyment of its rights. It was expressly agreed not to injure the count of Hapsburg in his possessions and his rights, not to separate from the German empire, and not to deny their duties to the abbey or the nobles. They were to avoid, as far as possible, shedding the blood of the territorial officers, since their only object was to secure to themselves and their posterity the freedom inherited from their forefathers.

MELEAGER, a Greek poet, who lived in the century preceding the Christian era. He was a native of Gadara, and spent the principal part of his life at Tyre; but he died in the Isle of Cos, where he had removed in the latter part of his life. Many short poems of Meleager have been preserved in the Grecian anthology, and in the simple elegance of their style contrast strongly with the productions of more recent bards in the same collection. The subject of the following translation from this poet is descriptive of the charms of female beauty:—

"Oh locks, that Damsel's forehead wreath!  
Oh Heliodora's sandal'd feet!  
And oh Timarion's doors, that breathe  
Moist odours from her chamber sweet!  
Oh Anticlea's smiles, that shed  
A tender luxury of light!  
Oh fillet! blooming fresh to sight  
On Dorothea's flower-twined head!  
Love! not thy golden quiver hides,  
In close reserve, the winged dart;  
Each arrow through my vital glides;  
I feel, I feel them in my heart."

MELISSUS, a native of Samos, who flourished about 444 B. C. He is distinguished in the history of his country as a statesman and naval commander. As a philosopher he is considered as belonging to the Eleatic school; he differed from Parmenides in many points, by developing the Eleatic system with still stricter consistency. Parmenides allowed credit to experience obtained through the senses; Melissus represented all existence as one eternal unlimited and immutable yet material being, and rejected the experience obtained through the senses; he also maintained that nothing could be known with certainty respecting the gods.

MELLON, HARRIET.—This lady, who attained a considerable share of celebrity from her dramatic talents and subsequent good fortune, was born in 1775. Her father was employed in the East India company, but died previous to her birth; shortly after which event her mother married a second husband, Mr. Entwistle, a musical professor of some celebrity, and who subsequently became leader of the band at the York theatre. Miss Mellon imbibed early a taste for dramatic pursuits, and at five years of age performed several juvenile characters on country stages. In the meantime her education was not neglected, and by Mr. Entwistle's perseverance and the assistance of a wealthy family at Halifax, his step-daughter rapidly progressed in improvement. Removing with her family to Staffordshire, she there became a member of Mr. Stanton's theatrical company, and performed various characters in that gentleman's circuit with an ability which elicited much applause. She

was altogether a most interesting child, and several of the first ladies in the county of Stafford became her warm patronesses, and in some cases her warm friends. One of those introduced her to Mr. Sheridan, then on a visit to his constituents at Stafford, and that gentleman, after seeing her perform *Rosalind and Priscilla Tomboy*, engaged her for Drury Lane. She made her *debut* at that theatre in 1793 as Lydia Languish in "*The Rivals*," and was received with the most flattering applause. "It was not assumed," says one of her biographers, "that Miss Mellon was a perfect representative of the character; but the vivacity of her air, the good sense she discovered in the dialogue, as well as her pleasing countenance and figure, were sufficiently admired to render her metropolitan *debut* decidedly a successful one. She immediately took her station at the head of the second-rate actresses of Drury Lane theatre, and often was entrusted with first-rate comic characters." In 1794 she is said to have gained a prize of 10,000*l.* in the lottery, when she immediately made a donation of 100*l.* to the theatrical fund. Some accounts say that this was a present from Mr. Coutts, the rich banker, whose repeated visits to her, and the substantial interest he took in her welfare, gave rise to a rumour that she resided under his protection for some years previous to her retirement from the stage. This event took place in 1815, in which year she became the wife of Mr. Coutts, who appears to have been devotedly attached to her, and at his death, in 1822, left her in sole possession of his immense property. This brought her various noble suitors, but she chose to give her hand to the duke of St. Alban's. This lady was the subject of much gross and distinguished calumny, which is equally unworthy of credit and notice. On all hands she was admitted to devote to charitable purposes a great portion of her wealth, her possession of which was certainly no ground for the infamous and malignant abuse with which a large portion of the press assailed her. The duchess of St. Alban's died much regretted on the 6th of August, 1837.

The charities of the duchess of St. Alban's were very numerous. When an actress of 4*l.* a week, she made baby-linen with her own hands and lent it, because she could not afford to give it, to poor women during their accouchement. Her liberality to the two theatrical funds is well known. She allowed Mr. Weitzer 100*l.* per annum; but her charities were at length partially (and only partially) stopped by the calumnies of those who attributed to affectation and love of notoriety what was really the offspring of a generous mind. Miss Stephens, Miss Foote, Miss Smithson, young Kean, and many others experienced the benefits of her fostering kindness; and whatever may have been the faults of the duchess, it is certain that we may look far and wide ere we find one who has ensured to others so much happiness, or effected so much good. The princely fortune which this lady received from her first husband, Mr. Coutts, was at her death nearly all divided between his grand-children.

MELMOTH, WILLIAM.—This gentleman, who is best known as the author of a work entitled "*The Great Importance of a Religious Life*," was born in 1710, and received a liberal education, but does not appear to have studied at either of the universities. He was bred to the law, and in 1756 received the appointment of commissioner of bankrupts, but passed

the chief part of his life in literary retirement at Shrewsbury and Bath. He first appeared as a writer about 1742, in a volume of letters, under the name of Fitzosborne, which have been much admired for the elegance of their style, and their calm and liberal remarks on various topics, moral and literary. In 1757 this production was followed by a translation of "*The Letters of Pliny the Younger*," which has been regarded as one of the happiest versions of a Latin author in the English language, although somewhat enfeebled by a desire to obliterate every trace of a Latin style. He was also the translator of Cicero's treatises "*De Amicitia*" and "*De Senectute*." These he enriched with remarks, literary and philosophical, in refutation of the opposing opinions of Lord Shaftesbury and Soame Jenyns, the first of whom maintained that the non-existence of any precept in favour of friendship was a defect in the Christian system, while the second held that very circumstance to form a proof of its divine origin. His last work was memoirs of his father, under the title of "*Memoirs of a late Eminent Advocate and Member of Lincoln's Inn*." Mr. Melmoth died at Bath in 1799.

MELVIL, SIR JAMES, a statesman and historian, who was born at Hall Hill in Fifeshire, in 1530; and at the age of fourteen became page to Mary queen of Scots, then wife to the dauphin of France. After having travelled and visited the court of the elector palatine, with whom he remained three years, on the accession of Mary to the throne of Scotland, Melvil followed her, and was made privy counsellor and gentleman of the bed-chamber, and continued her confidential servant until her imprisonment in Loch Leven castle. He was sent to the court of Elizabeth, and maintained correspondences in England in favour of Mary's succession to the English crown. He died in 1606. He left an historical work in manuscript, which was published in 1683 under the title of "*Memoirs of Sir James Melvil of Hall Hill, containing an Impartial Account of the Most Remarkable Affairs of State during the last Age*."

MENAGE, GILLES, a distinguished man of letters of the seventeenth century, who was born at Angers in 1613, in which city his father was king's advocate. After finishing his early studies with great reputation he was admitted an advocate, and pursued his occupation for some time at Paris; but, disgusted with that profession, he adopted the ecclesiastical character so far as to be able to hold some benefices without cure of souls. From this time he dedicated himself solely to literary pursuits; and being received into the house of Cardinal de Retz, soon made himself known by his wit and erudition. He subsequently took apartments in the cloister of Notre Dame, and held weekly assemblies of the learned, where a retentive memory rendered his conversation entertaining, although pedantic. He was, however, overbearing and opinionative, and passed his life in the midst of petty hostilities. He precluded himself from being chosen to the French academy by a witty satire entitled "*Requête des Dictionnaires*," directed against the dictionary of the academy. He died in Paris in 1692. His principal works are, "*Dictionnaire Etymologique, ou Origines de la Langue Française*," "*Origines de la Langue Italienne*," "*Miscellanea*," an edition of Diogenes Laertius, with valuable notes, "*Remarques sur la Langue Française*," "*Anti-Baillet*," a satirical critique, "*Historia Mulierum Philosophorum*," "*Poésies Latines, Italiennes*,"

Grecques, et Françaises." After his death a "Ménagiana" was compiled from notes of his conversation, anecdotes, remarks, &c., which is one of the most lively works of the kind.

**MENANDER.**—This most celebrated Greek writer was born at Athens B. C. 342, and is said to have drowned himself on account of the success of his rival Philemon at the age of fifty-two years, though some accounts attribute his death to accident. The superior excellence of his comedies, the number of which exceeded 100, acquired him the title of prince of the new comedy. We have unfortunately nothing but a few fragments remaining of them. Terence imitated and translated him, and from his comedies we may form some idea of the character of those of Menander.

**MENASSEH BEN ISRAEL**, a celebrated rabbi, who was born in Portugal about 1604. His father was a rich merchant, who suffered greatly both in property and person from the inquisition, and on that account fled into Holland. At the age of eighteen the son was made preacher and expounder of the Talmud at Amsterdam. In 1632 he published, in the Spanish language, the first part of his work entitled "Conciliador," &c., of which the next year a Latin version was printed by Dionysius Vossius, entitled "Conciliator, sive de Convenientia Locorum S. Scripturæ quæ pugnare inter se videntur, Opus ex vetustis et recent oribus omnibus Rabbinis magna Industria ac Fide congestum." He also published three editions of the Hebrew Bible. In the time of Cromwell he came to this country, and obtained for his nation more privileges than they ever before enjoyed. He died at Amsterdam in 1659. His other works are the "Talmud Corrected," with notes, "De Resurrectione Mortuorum," "Esperanza de Israel," dedicated to the English parliament in 1650, one object of which is to prove that the ten tribes are settled in America, and "An Apology for the Jews in the English Language."

**MENDELSSOHN, MOSES**, a celebrated Jewish philosopher, who was born in 1729 at Dessau, Germany. His father, though very poor, gave him a careful education, and himself instructed the boy in Hebrew and the rudiments of Jewish learning, others instructed him in the Talmud. The Old Testament also contributed to the formation of his mind. The poetical books of those ancient records attracted the boy particularly. The celebrated book of Maimonides, "More Nevochim," or "Guide of the Erring," happening to fall into his hands, excited him first to the enquiry after truth and to a liberal way of thinking. He studied this work with such ardent zeal that he was attacked by a nervous fever, which, carelessly treated, entailed upon him for the rest of his life a crooked spine and weak health. His father was unable to support him any longer, and he wandered in 1742 to Berlin, where he lived several years in great poverty, dependent on the charity of some persons of his own religion. Chance made him acquainted with Israel Moses, a man of philosophical penetration and a great mathematician, who, persecuted every where on account of his liberal views, lived also in utter poverty and became a martyr to truth. This man often argued with Mendelssohn on the principles of Maimonides. He also gave him a Hebrew translation of Euclid, and thus awakened in the youth a love for mathematics. A young Jewish physician named Kisch encouraged him to study

Latin, and gave him some instruction in this language, and Dr. Gumpert made him acquainted with modern literature.

Thus he lived without any certain support, all the time occupied with study, until a silk manufacturer of his persuasion at Berlin, Mr. Bernard, appointed him tutor of his children, and at a later period he took him as a partner in his business. In 1754 he became acquainted with Lessing, who had a decided influence upon his mind. Intellectual philosophy became now his chief study. His "Letters on Sentiments" were the first fruit of his labours in this branch. He became now also acquainted with Nicolai and Abbt, and his correspondence with the latter is a monument of the friendship and familiarity which existed between these two distinguished men. Mendelssohn contributed to several of the first periodicals, and now and then appeared before the public with philosophical works which acquired him fame, not only in Germany but also in foreign countries. He established no new system, but was nevertheless one of the most profound and patient thinkers of his age, and the excellence of his character was enhanced by his modesty, uprightness, and amiable disposition. His disinterestedness was without limits, and his beneficence ever ready, as far as his small means would allow. He knew how to elude with delicacy the zealous efforts of Lavater to convert him to Christianity; yet his grief at seeing himself so unexpectedly assailed brought on him a severe sickness, which long incapacitated him for scientific pursuits.

In his "Jerusalem, oder über religiöse Macht und Judenthum," he gave to the world in 1783 many excellent ideas, which were much misunderstood, partly because they attacked the prejudices of centuries. In some morning lessons he had expounded to his son and other Jewish youths the elements of his philosophy, particularly the doctrine of God. He therefore gave the name of "Morning Hours" to the work containing the results of his investigations, of which his death prevented him from completing more than one volume. F. H. Jacobi having addressed to him a treatise "On the Doctrine of Spinoza," he thought himself obliged to defend his deceased friend Lessing against the charge of having been an advocate of Spinoza's doctrines. Without regarding the exhausted state of his health, he hastened to publish his work entitled "Moses Mendelssohn to the Friends of Lessing," and became in consequence so much weakened, that a cold was sufficient to put an end to his valuable life in 1786. The German language is indebted to him in part for its development.

In the philosophical dialogue he made the first successful attempt among the writers of his country, taking for his models Plato and Xenophon. Besides the works already mentioned, he wrote "Philosophische Schriften;" his masterpiece, "Phædon, or On the Immortality of the Soul," which has gone through several editions since 1767, and has been translated into most modern European languages.

**MENDEZ, MOSES**, a clever Jewish poet, who was born in the metropolis and educated at Oxford, where he received the degree of B. A. in 1750. He was the author of several popular musical entertainments, among which that called "The Chaplet" is considered the best. His poem entitled "The Seasons" is in the style of Spenser, of whom he was a

great admirer. The following is an extract from this production :—

" Ere yet I sing the round-revolving year,  
And show the toils and pastime of the swain,  
At Alcon's grave I drop a pious tear;  
Right well he knew to raise his learned strain,  
And, like his Milton, scorn'd the rhyming chain.  
Ah! cruel fate, to tear him from our eyes;  
Receive his wreath, albe the tribute's vain,  
From the green sod may flowers immortal rise,  
To mark the sacred spot where the sweet poet lies.

It is the cuckoo that announceth spring,  
And with his wreakful tale the spouse doth fray:  
Meanwhile the finches harmless ditties sing,  
And hop, in buxom youth, from spray to spray,  
Proud as Sir Paride, of rich array.  
The little wantons that draw Venua' team  
Chirp am'rous through the grove in beavies gay;  
And he, who erst gain'd Leda's fond esteem,  
Now sail'd on Thamis' tide, the glory of the stream!

Proud as the Turkish sultan, chaunticleer  
Bees, with delight, his numerous race around:  
He grants fresh favours to each female near;  
For love as well as cherisaunce renown'd.  
The waddling dame that did the Gauls confound,  
Her tawny sons doth lead to rivers cold;  
While Juno's darling, with majestic bound,  
To charm his leman doth his train unfold,  
That glows with vivid green, that flames with burning gold.

But hark! the bag-pipe summons to the green,  
The jocund bag-pipe, that awaketh sport;  
The blithesome lasses, as the morning sheen,  
Around the flower-crown'd May-pole quick resort:  
The gods of pleasure here have fix'd their court.  
Quick on the wing the flying moment seize,  
Nor build up ample schemes, for life is short,  
Short as the whisper of the passing breeze.  
Yet, ah! in vain I preach—mine heart is ill at ease."

**MENDEZ PINTO, FERDINAND**, a celebrated Portuguese traveller, who in 1537 embarked in a ship bound for the Indies; but in the voyage it was attacked by the Moors, who carried it to Mocha and sold Ferdinand for a slave. After various adventures he arrived at Ormus, whence he proceeded to the Indies, and returned to Portugal in 1558. He published a curious account of his travels, which has been translated into French and English. Mendez Pinto, from his excessive credulity, has been classed with the English Sir John Mandeville, and both are now chiefly quoted for their easy belief and extravagant fiction.

**MENDOZA, DON DIEGO HURTADO DE**, a Spanish classic, who was also distinguished as a politician and a general in the brilliant age of Charles V. He was descended from an ancient family, which had produced several eminent scholars and statesmen, and was born at Granada in 1503. As a poet and historian, he contributed to establish the reputation of Castilian literature; but his public life displayed nothing of the finer feelings of the poet, the impartial love of truth of a philosopher, or the clear discernment of the experienced statesman. Stern, severe, arbitrary, and haughty, he was a formidable instrument of a despotic court. When Don Diego left the university of Salamanca, where his talents, wit, and acquirements, had rendered him conspicuous, he served in the Spanish army in Italy, and in 1538 Charles V. appointed him ambassador to Venice. In 1542 he was imperial plenipotentiary to the council of Trent, and in 1547 ambassador to the court of Rome, where he persecuted and oppressed all those Italians who yet manifested any attachment to the freedom of their country. As captain-general and governor of Sienna, he subjected that republic to the dominion of Cosmo I. of Medici, under Spanish supremacy, and crushed the Tuscan spirit of liberty.

Hated by the liberals, held in horror by Paul III., whom he was charged to humble in Rome itself, he ruled only by bloodshed; and, though constantly threatened with the dagger of assassins, not only for his abuses of his power, but also on account of his love intrigues in Rome, he continued to govern until 1554, when he was recalled by Charles V. Amidst the schemes of arbitrary power, Mendoza employed himself in literary labours, and particularly in the collection of Greek and Latin manuscripts. He sent learned men to examine the monastery of Mount Athos for this purpose, and took advantage of his influence at Soliman's court for the furtherance of the same object. After the abdication of Charles V. he was attached to the court of Philip II. An affair of gallantry involved him in a quarrel with a rival, who turned his dagger upon him. Don Diego threw him from the balcony of the palace into the street, and was, in consequence, thrown into prison, where he spent his time in writing love elegies. He was afterwards banished to Granada, where he observed the progress of the Moorish insurrection in the Alpujarra mountains, and wrote the history of it. This work is considered one of the best historical writings in Spanish literature. He was also engaged till the time of his death, which took place in 1575, in translating a work of Aristotle, with a commentary. His library he bequeathed to the king, and it now forms one of the ornaments of the Escorial. His poetical epistles are the first classical models of the kind in the literature of his country. They are mostly imitations of Horace, written in an easy style, and with much vigour, and show the man of the world. Some of them delineate domestic happiness and the tenderer feelings with so much truth that we can with difficulty recognise the tyrant of Sienna. His sonnets are deficient in elevation, grace, and harmony, and his canzoni are often obscure and forced. In the Spanish forms of poetry, redondillas, quintillas, and villancicos, he surpassed his predecessors in elegance of diction. His satires, or burlescas, were prohibited by the inquisition. As a prose writer, he forms an epoch; he has been called the father of Spanish prose. His comic romance, written while he was yet a student, "*Vida de Lazarillo de Tormes*," has been translated into foreign languages. The hero of this tale is a cunning beggar, and the life of the various classes of the people is described in it with great spirit and truth. The numerous imitations of *Lazarillo de Tormes* produced a peculiar class of writings in Spanish literature—*gusto picaresco*, so called. His second great work, the "*History of the War of Granada*," may be compared with the works of Livy and Tacitus. Though Mendoza does not pronounce judgment, yet it is easy to see, from his relation, that the severity and tyranny of Philip had driven the Moors to despair. The Spanish government would not, therefore, permit the printing of it till 1610, and then only with great omissions.

**MENEDEMUS OF ERETRIA** was the founder of the Eretrian school of philosophy, which formed a branch of the Socratic. He was a pupil of Plato and Stilpo, and ascribed truth only to identical propositions. He is said to have starved himself to death because he could not engage Antigonus to restore freedom to his country.

**MENGES, ANTHONY RAPHAEL**, one of the most distinguished artists of the eighteenth century. He was born at Aussig in Bohemia in 1728, and was

the son of an indifferent Danish artist, who had settled in Dresden. From the sixth year of his age the young Raphael was compelled to exercise himself in drawing, daily and hourly, and, a few years later, was instructed by his father in oil, miniature, and enamel painting. The father hardly allowed him a moment for play, set him tasks which he was required to accomplish within a given time, and severely punished him if he failed. In 1741 the young artist accompanied his father to Rome, and studied the remains of ancient statuary, the works of Michael Angelo in the Sistine Chapel, and finally, the inimitable productions of the divine Raphael in the Vatican. He was left to pass the day there with bread and water, and in the evening his studies were examined with the greatest severity. In 1744 his father returned with him to Dresden, and Augustus soon after appointed him court-painter. A second visit to Rome was occupied in renewing his former studies, studying anatomy, &c. His first great compositions appeared in 1748, and met with universal admiration. A Holy Family was particularly admired; and the young peasant girl who served him as a model became his wife.

On his return to Dresden the king appointed him principal court-painter; and in 1751 he was engaged to paint the altar-piece for the catholic chapel, with leave to execute it in Rome; and about the same time he made a copy of Raphael's School of Athens for the duke of Northumberland. The seven years' war deprived him of his pension; but in 1754 he received the direction of the new academy of painting in the Capitol, and in 1757 the Celestines employed him to paint the ceiling of the church of St. Eusebius, his first fresco. He soon after painted, for Cardinal Albani, the Parnassus in his villa, and executed various oil paintings. In 1761 Charles III. invited Mengs to Spain, where his principal works at this time were an assembly of the gods and a Descent from the Cross. Returning to Rome, he executed a great allegorical fresco painting for the pope, in the *camera de' papiri*, and, after three years, returned to Madrid. At this time he executed the apotheosis of Trajan in fresco, his finest work. He died in Rome in 1779, leaving seven children, thirteen having died previously. His expensive manner of living, and his collections of drawings of masters, vases, engravings, &c., had absorbed all his gains, although during the last eighteen years he had received 180,000 scudi. A splendid monument was erected to his memory by his friend the cavalier d'Azara, at the side of Raphael, and another by the empress of Russia, in St. Peter's. Mengs's composition and grouping is simple, noble, and studied; his drawings correct and ideal; his expressions, in which Raphael was his model, and his colouring, in every respect, are excellent. His works are finished with the greatest care. His writings in different languages, particularly his "Remarks on Correggio, Raphael, and Titian," are highly instructive.

**MENINSKI, OR MENIN, FRANCIS**, a celebrated orientalist, who was born in Lorraine in 1623, and studied at Rome, under the learned Jesuit Grattini. At the age of thirty he accompanied the Polish ambassador to Constantinople, and, applying himself to the study of the Turkish language, became first interpreter to the Polish embassy at the Porte, and soon after was appointed ambassador

plenipotentiary to the court. He was naturalized in Poland, and added the termination *ski* to his family name of Menin. In 1661 he became interpreter of the Oriental languages at Vienna, and was entrusted with several important commissions; and in 1669, on going to visit the holy sepulchre of Jerusalem, he was created a knight of that order, and, on his return to Vienna, was created one of the emperor's council of war. His principal work was his "*Thesaurus Linguarum Orientalium*," published at Vienna in 1680. Meninski died at Vienna in 1698.

**MENIPPUS**, a cynic, and disciple of the second Menedemus. He was a native of Gadara in Palestine, and his writings were chiefly of a satirical kind, so much so indeed that Lucian styles him "the most snarling of cynics," and, in two or three of his dialogues, introduces him as the vehicle of his own sarcasms. It appears that his satires were composed in prose; on which account those of Varro were denominated "Menippean," and, for the same reason, that of satire "Minippe" was given, in France, to the celebrated work written against the league. Menippus is said to have hanged himself in consequence of being robbed of a large sum of money. He had been originally a slave, but purchased his freedom, and was made a citizen of Thebes. None of his works is now extant.

**MENNO, SIMONIS**, an enthusiast, who was born in Friesland in 1505, and joined the anabaptists in 1537, having been previously a catholic priest. After the suppression of the disturbances at Munster, Menno collected the scattered remnants of the sect, and organized societies, for which he secured the toleration of the government. His peregrinations for many years in Holland and the north of Germany, as far as Livonia, contributed to increase the number of his followers and to disseminate his doctrines among those who were not satisfied with the progress of the protestant churches in reform. Except in some opinions respecting the incarnation of Christ, to which he was probably led by the controversy concerning the bodily presence of Christ in the eucharist, and in the administration of baptism to adults only, his tenets agreed, in general, with those of the Calvinists. Menno died at Oldeslohe in Holstein, 1561.

**MENOU, JACQUES FRANCOIS, BARON**, a military leader, who was born in Touraine in 1750. He entered the military service at an early age, and rose rapidly to a high rank. In 1789 the noblesse of Touraine chose him their deputy to the states-general, where he was one of the earliest to unite with the third estate. Menou turned his attention particularly to the new organization of the army, and proposed to substitute a general conscription of the young men in the place of recruiting. His subsequent votes and propositions in favour of vesting the declaration of war in the nation, of arming the national guard, &c., were generally on the revolutionary side; but when the more violent opinions began to prevail, he joined those who endeavoured to moderate the excitement. In 1792 he resumed his military duties, and was second in command of the troops of the line stationed near Paris. In this capacity he accompanied the king to the assembly, and was afterwards repeatedly denounced to the convention as an enemy to the revolution. He, however, escaped condemnation, and in May 1795 commanded the troops who defended the convention against the insurgents of the Faubourg

St. Antoine. Menou afterwards accompanied Bonaparte to Egypt, and distinguished himself by his courage on several occasions. After the return of Bonaparte, he married the daughter of a rich bath-keeper of Rosetta, submitting to all the ceremonies of the laws of Mahomet, and adopting the name of Abdallah. On the death of Kléber he took the chief command, and, after a gallant defence in Alexandria, was obliged to capitulate to the English. Bonaparte received him favourably on his arrival in France, and appointed him governor of Piedmont. Menou was afterwards sent to Venice, in the same capacity, and died there in 1810.

**MENSCHIKOFF, ALEXANDER**, a Russian nobleman, who was born near Moscow in 1674, and employed by a pastry-cook to sell pastry in the streets of Moscow. Different accounts are given of the first cause of his rise. According to some statements, he overheard the project of a conspiracy by the Strelitz, and communicated it to the czar; other accounts represent him as having attracted the notice of Lefort, who took him into his service, and, discerning his great powers, determined to educate him for public affairs. Lefort took the young Menschikoff with him on the great embassy in 1697, pointed out to him whatever was worthy of his attention, and instructed him in military affairs, and in the maxims of politics and government. On the death of Lefort, Menschikoff succeeded him in the favour of the czar, who placed such entire confidence in him that he undertook nothing without his advice; yet his passion for money was the cause of many abuses, and he was three times subjected to a severe examination, and was once also condemned to a fine. The emperor punished him for smaller offences on the spot; but much of his selfishness and faithlessness was unknown to his sovereign, and he was much indebted for support to the empress Catharine. He became first minister and general field-marshal, baron and prince of the German empire, and received orders from the courts of Copenhagen, Dresden, and Berlin. Peter also conferred on him the title of duke of Ingria. On the death of Peter, it was chiefly through the influence of Menschikoff that Catharine was raised to the throne, and that affairs were conducted during her reign. When Peter II. succeeded her on the throne, Menschikoff grasped with a bold and sure hand the reins of government; but in 1727, when his power was raised to the highest pitch, he was suddenly hurled from his elevation. Having embezzled a sum of money which the emperor had intended for his sister, he was condemned to perpetual exile in Siberia, and his immense estate was confiscated. He passed the rest of his life at Beresov, where he lived in so frugal a manner that, out of a daily allowance of ten roubles, he saved enough to erect a small wooden church, on which he himself worked as a carpenter. He sunk into a deep melancholy, said nothing to any one, and died in 1729. Menschikoff was selfish, avaricious, and ambitious, implacable and cruel, but gracious, courageous, well-informed, capable of large views and plans, and persevering in the execution of them. His services in the promotion of civilization, commerce, the arts and sciences, and in the establishment of Russian respectability abroad, have been productive of permanent good effects.

**MENZEL, FREDERICK WILLIAM**, a Saxon gentleman, who held the office of private secretary in

the royal cabinet of Dresden previous to the breaking out of the seven years' war. Frederick II., suspecting that negotiations were going on against him between the courts of Petersburg, Vienna, and Dresden, directed his minister at the court of Saxony to procure information on the subject. Chance made the ambassador acquainted with Menzel, whose expensive and dissipated habits had plunged him into embarrassments, to relieve which he had been induced to purloin from the public treasury. The unhappy man hoped to preserve himself by a greater crime, and, in consideration of a large sum of money, delivered to the Prussian ambassador copies of the secret correspondence between Saxony, Russia, and Austria, relating to Prussia. His conscience, indeed, was awakened, but he could not turn back without forfeiting the protection of the ambassador in case of detection. During a journey to Warsaw, in the retinue of the king, traces of his guilt were at length discovered. Menzel himself was surprised by the report of the discovery of his treachery in a social party. He attempted to save himself by flight, but was arrested at Prague, on the demand of the court of Saxony, and imprisoned, first at Brunn, but after the conclusion of the peace of Hubertsburg, in the castle of Konigstein. Here he lived thirty-three years, at first in the strictest custody. During his imprisonment at Brunn he cherished the hope that Prussia would stipulate for his liberation at the conclusion of peace. Through the favour of King Frederick Augustus I., his condition was somewhat alleviated in the latter part of his life; he received better food, and permission to take the air now and then; he was also relieved of the heavy chains which he had worn many years. He died in May 1796, at the age of seventy.

**MENZEL, CHARLES ADOLPHUS**, a German historian, who was born in 1784, in Grünberg, Silesia, and studied at Halle, where he devoted himself particularly to history. He published several historical works, which, though not equal in deep research to those of many contemporary writers of Germany, are valuable for their descriptive merit, particularly his "History of the Germans," which comes down to the death of Maximilian I. As a continuation of Becker's "Universal History," he wrote "A History of Modern Times since the Death of Frederic II." His last work was "A Modern History of the Germans from the Reformation to the Act of Confederacy," which is to be considered a continuation of his history of the Germans.

**MERCATOR, GERARD**, a mathematician and geographer, who was born at Rupelmonde, in the Low Countries, in 1512, and studied at Louvain, applying himself with such intensity as to forget to take the necessary food and sleep. His progress in the mathematics was very rapid, although without a teacher, and he soon became a lecturer on geography and astronomy, making his instruments with his own hands. Granvella, to whom he presented a terrestrial globe, recommended him to Charles V. Mercator entered into the emperor's service, and executed for him a celestial globe of crystal, and a terrestrial globe of wood. In 1559 he retired to Duisburg, and received the title of cosmographer to the duke of Juliers. His last years were devoted to theological studies. He died in 1594. Mercator published a great number of maps and charts, which he engraved and coloured himself. He is known

as the inventor of a method of projection called by his name, in which the meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, which has the effect of enlarging the degrees of latitude as they recede from the equator. His first maps on this projection were published in 1569; the principles were first explained by Edward Wright, in 1599, in his "Corrections of Errors in Navigation," whence the discovery has sometimes been attributed to him. His "*Tabulæ Geographicae*" is the best edition of the maps of Ptolemy, and has been merely copied by his successors.

MERCER, HUGH, a brigadier-general in the American revolutionary army, who was by birth a native of Scotland. He was liberally educated, studied medicine, and acted as a surgeon's assistant in the memorable battle of Culloden. He emigrated from his country not long after to Pennsylvania, but removed to Virginia, where he settled and married. He was engaged with Washington in the Indian wars of 1755, &c., and his children are in possession of a medal which was presented to him by the corporation of the city of Philadelphia, for his good conduct in the expedition against an Indian settlement, conducted by Colonel Armstrong, in September 1756. In one of the engagements with the Indians, General Mercer was wounded in the right wrist, and being separated from his party, he found that there was danger of his being surrounded by hostile Indians, whose war-whoop and yell indicated their near approach. Becoming faint from loss of blood, he took refuge in the hollow trunk of a large tree. The Indians came to the spot where he was concealed, seated themselves about for rest, and then disappeared. Mercer left his hiding-place, and pursued his course through a trackless wild of about one hundred miles, until he reached Fort Cumberland. On the way he subsisted on the body of a rattlesnake, which he met and killed. When the war broke out between the colonies and the mother country, he immediately joined the former, and distinguished himself by his bravery and skill during that important period of American history.

MERCY, FRANCOIS DE, one of the most distinguished generals in the thirty years' war. He was born at Longwy in Lorraine, and rose in the service of the elector of Bavaria through the successive ranks. After having defeated General Rantzau at Tuttlingen, he was appointed, with the rank of Bavarian lieutenant-general and imperial field-marshal, to the command of the combined forces, and captured Rotweil and Uberlingen. In the succeeding year, 1644, Friburg fell into his hands, and he threw up a fortified camp in its vicinity. The great Condé attacked him in this position, and after a combat of three days compelled him to retire. Turenne pursued him, but the retreat was so ably conducted that the French general was unable to obtain any advantage over him. In May 1645 he defeated Turenne at Marienthal, and fell on the 3rd of August, 1644, in the battle of Allersheim, near Nordlingen. He was buried on the field, and a stone was raised with the inscription *Sta, viator, heroem calcas*. Rousseau, in his "*Emile*" very justly remarks, that the simple name of one of his victories would have been preferable to this inflated sentence, borrowed from antiquity.

MERCY, FLORIMOND CLAUDE DE, a grandson of Francois de Mercy, who was born in Lorraine

in 1666, and entered the service of the emperor Leopold in 1682, and distinguished himself as a volunteer in the defence of Vienna against the Turks. His gallantry, particularly in the battle of Zenta, was rewarded with the rank of major. He afterwards served with equal distinction in Italy and on the Rhine. In 1705 he stormed the lines of Pfaffenhofen, and compelled the French to retreat under the cannon of Strasburg. In 1706 he covered Landau by his skilful manœuvres, and supplied it with provisions and troops. In 1707 he defeated General Vivans at Offenburg; but, having penetrated too far into Alsace, was entirely defeated at Rumersheim. In 1716 he commanded, with equal success, in Sicily against the Spaniards, and during the peace exerted himself in improving the condition of the Bannat. In 1734 he received the command in Italy, and occupied the duchy of Parma, but fell while leading the attack in person on the village of Croisetta. His remains were interred at Reggio.

MERIAN, MATTHEW, senior, an artist of celebrity, who was born at Basle in 1593. He studied at Zurich under Dietrich Meyer, and at Oppenheim under Theodore de Bry. He subsequently settled at Frankfort on the Maine, and died in 1651. His principal engravings consist of views of the chief cities of Europe, particularly those of Germany, with descriptions, and are remarkable for the excellence of their perspective. His other works are landscapes, historical scenes, the chase, &c.—His son, Matthew Merian, was born at Basle in 1621, and became a good painter of portraits. He studied at Rome, 1644, travelled in England, the Low Countries, France, &c., and died in 1687.—Maria Sibylla, a daughter of the elder Matthew, was born at Frankfort in 1647. She studied under her step-father Morefels, and Mignon, and was distinguished by the taste, skill, and accuracy with which she painted flowers and insects in water colours. Her zeal for this department of painting induced her to make a voyage to Surinam, for the purpose of observing the metamorphosis of the insects of the country; and, after a residence of two years, she returned with a large collection of drawings of insects, plants, and fruits on vellum. Her works are "*Erucarum Ortus, Alimentum, et Metamorphosis*;" "*History of the Insects of Europe*;" and "*Metamorphosis Insectorum Surinamensium*," with sixty plates. She died at Amsterdam in 1717. One of her daughters published a new edition of the last-named work, which her mother was preparing at the time of her death.

MERLIN, AMBROSE, a British writer, who flourished about the latter end of the fifth century. The accounts we have of him are so mixed up with fiction, that to disentangle his real life from the mass would be impossible. He was said to be the son of a demon and a daughter of a king of England who was a nun. His birth-place was Carmarthen in Wales; and he is said to have been instructed by his father in all branches of science, and received from him the power of working miracles. He was the greatest sage and mathematician of his time, the counsellor and friend of four English kings, Vortigern, Ambrosius, Pendragon, and Arthur. Vortigern, at the advice of his magicians, had resolved to build an impregnable tower, in order to secure himself against the Saxons; but the foundation was scarcely laid when the earth opened by night and swallowed it up. The magicians informed the king, that to give firmness to the

foundation, he must wet it with the blood of a child born without a father. After much search, the young Merlin was brought to the king. After Merlin had heard the dictum of the magicians, he disputed with them and showed them that under the foundation of the tower was a great lake, and under the lake two great raging dragons,—one red, representing the British, one white, representing the Saxons. The earth was dug open, and no sooner were the dragons found than they commenced a furious battle; whereupon Merlin began to weep, and to utter prophecies respecting the future state of England. The miracles ascribed to him are numerous. He is said to have escaped from the Saxons in a ship of glass. Instead of dying, it was supposed that he fell into a magic sleep, from which after a long period he would awake, and to this fable Spenser alludes in his "Faery Queen." In the British Museum is "*Le Compte de la Vie de Merlin et de ses Faits et Compte de ses Prophéties*," in two folio volumes, on vellum, without date or place.

MERLIN, PHILIP ANTONY, generally called Merlin de Douai, was born in 1754, in the village of Arleux in Flanders. His father, who was a farmer, had him placed in the rich abbey of Anchin, near Douai. The monks taught him to read and write, sent him to college, and educated him to the profession of the law. The young Merlin was no sooner admitted an advocate than his benefactors gave him the direction of the legal concerns of their wealthy house, and obtained for him the same charge from the chapter of Cambray. In 1789 he was chosen deputy to the states-general by the *tiers-état* of Douai, and when Necker called for a patriotic contribution in the midst of the distresses of the treasury, M. Merlin offered to the public wants a fourth of his revenue, amounting to 10,000 francs. He was a member of the committee formed to prepare the means of abolishing the feudal system, and drew up many able reports on this subject. After the session he was appointed president of the criminal tribunal of the north, and in 1792 deputy to the convention for that department. He voted for the death of the king without appeal to the people, and without respite; and he endeavoured to obtain a law, providing that no deputy should be sent before the revolutionary tribunal until the assembly itself should have decreed his accusation. Robespierre and Couthon opposed the law, with menaces against its advocates, and the proposition was lost.

He was afterwards successively president of the convention, and member of the committee of public safety. In March 1795 he proposed a decree of accusation against Barrere, Billaud de Varennes, Collot d'Herbois, and Vadier; and demanded a new organization of the revolutionary tribunal, with a view to lessen its power. When the sections of Paris were preparing to attack the convention, M. Merlin was one of the first to denounce the city; and on the 30th of September, 1795, obtained a decree that the armed force should be at the sole disposal of the representatives of the people, and that any other authority which should call it into action should be punished with death. Shortly after he presented in the tribune a code of crimes and punishments, which was decreed in two sittings, and remained in force until 1811. In 1795 the directory appointed M. Merlin minister of justice. He was also appointed a member of the directory in the room of M. Barthélemy, but resigned

his seat in the executive government in 1799, and retired to Douai. Napoleon recalled him from his retreat, and under the imperial government he became advocate-general, commandant of the legion of honour, and received the dignity of count. In 1806 he was appointed a member of the council of state, in which he acquired much influence. On the return of the king in 1814, M. Merlin was permitted to resign with a pension. On the return of Napoleon from Elba M. Merlin hastened to offer him homage, and was made one of his ministers of state; and he was afterwards chosen member of the chamber of representatives for the department of the north. He had been a member of the institute from its commencement. M. Merlin quitted France in 1816 with the design of passing to America; but being shipwrecked, he obtained permission to reside in the Netherlands.

MERRICK, JAMES, an English poet, who was born in 1720, and educated at Oxford. He took the degree of B. A. in 1739, and was chosen a probationer fellow in May 1744. The celebrated Lord North, and Lord Dartmouth, were his pupils at this college. He entered into holy orders, but never engaged in any parochial duty, being subject to acute pains in his head, frequent lassitude, and feverish complaints; but, from the few manuscript sermons which he left behind him, appears to have preached occasionally. His life was chiefly passed in study and literary correspondence, and much of his time and property were employed on acts of benevolence. Few men have been mentioned with higher praise by all who knew him. In 1734, while he was yet at school, he published "*Messiah, a Divine Essay*;" and, in April 1739, before he was twenty years of age, he was engaged in a correspondence with the learned Reimarus. The imprimatur from the vice-chancellor, prefixed to his translation of "*Tryphiodorus*," is dated the 20th of October, 1739, before he had taken his bachelor's degree. In Alberti's last volume of Hesychius, published by Ruhenkenius, are many references to Mr. Merrick's notes on "*Tryphiodorus*," which serve to illustrate the Greek writer by historical and critical explanations; many of them have a reference to the New Testament, and show how early the author had turned his thoughts to sacred criticism. Mr. Merrick was, in addition to the works already mentioned, the author of several other books of considerable merit. He died much regretted on account of his blameless life, in 1769.

MERRY, ROBERT, an English poet and dramatic writer, who was born in 1755 at London, where his father was a merchant. He received his education at Harrow under Dr. Summers, and had the celebrated Dr. Parr as private tutor. From Harrow he went to Cambridge, and on leaving that university he bought a commission in the horse guards; but subsequently quitted the service and went abroad, where he remained nearly eight years; during which time he visited most of the principal towns of France, Switzerland, Italy, Germany, and Holland. At Florence he studied the Italian language, encouraged his favourite pursuit, poetry, and was elected a member of the academy Della Crusca. Here also he was a principal contributor to a collection of poetry, by a few English of both sexes, called "*The Florence Miscellany*." The name of the academy he afterwards used as a signature to many

poems which appeared in the periodical journals, and the newspapers, and excited so many imitators as to form a sort of temporary school of poets, whose affectations were justly ridiculed by the author of the "Baviad and Mæviad." Mr. Merry, however, had more of the qualities of a poet than his imitators, although not much more judgment. His taste, originally good, became vitiated by that love of striking novelties which exhausts invention. In 1791 he married Miss Brunton, an actress, who performed in his tragedy of "Lorenzo," and a prospect opened to him by the joint production of that lady's talents, and his own pen; but the pride of his relations was wounded by the alliance; and he was constrained, much against Mrs. Merry's inclination, to take her from the stage. They retired to America in 1796, and died suddenly at Baltimore, in Maryland, in 1798.

\* MERSCH, VAN DER, a popular leader of the Brabant patriots in 1789, who was born at Menin, and entered the French service, in which he acquired the title of the brave Fleming. He afterwards served in the Austrian army, in which he rose to the rank of lieutenant-colonel. In the beginning of the opposition to Austria in the Low Countries, the command of a hastily raised body of troops was given to him, with which, though undisciplined and inferior to the enemy, he made a successful attack on the imperial forces at Hoogstraaten near Antwerp. After some other successful operations, which placed Ghent and Brussels in his hands, the chief command of the Belgian troops was entrusted to him. Party divisions soon, however, found their way into the government, and the enemies of Van der Mersch succeeded by their intrigues in removing him from his command, and, although they could prove nothing against him, threw him into prison. He remained in confinement until the Austrians recovered possession of the country, and died at Menin in 1792, esteemed and regretted.

MERTON, WALTER DE, a learned English prelate, who lived in the thirteenth century. He received a good classical education at Merton in Surrey, and afterwards devoted himself to a monastic life. By his talents and general ability he rose through several ecclesiastical offices of weight and importance, till, in 1258, he was advanced to the post of chancellor of England. Of this office he was deprived in the same year by the barons, but restored in 1261, with a yearly salary of 400 marks; and held it again in 1274, in which year he was consecrated bishop of Rochester. He appears to have been of high credit in affairs of state, and consulted on all matters of importance, as a divine, a lawyer, and a financier. His death was occasioned by a fall from his horse, in fording a river in his diocese in 1277. Notwithstanding his liberality, at his death he was possessed of goods valued by inventory at 5110*l.*, of which he left legacies to the amount of 2726*l.* His debts amounted to 746*l.*, and he had owing to him about 622*l.*

This prelate was interred on the north side of St. William's chapel, at the north end of the cross aisle in Rochester cathedral, with a marble monument, which had probably been injured or decayed, as in 1598 the present beautiful alabaster monument was erected by the society of Merton college, at the suggestion of the celebrated Sir Henry Savile, then warden of the college. With respect to the founda-

tion of this college, an opinion has long prevailed which the inquiries of some recent antiquaries have rendered doubtful. It was stated by Wood and others, that Walter de Merton first founded a college at Maldon, as a nursery for that at Oxford; that at a certain age the scholars were removed from Maldon to Oxford, where the founder provided a house for them on the site of the present college, and that the whole establishment was not removed from Maldon to Oxford until the year 1274, when the third and last charter was obtained. On the other hand, his original intention appears to have been to establish a religious house at Maldon, consisting of a warden and priests, who were to appropriate certain funds, with which he entrusted them, to the maintenance and education of twenty scholars at Oxford or elsewhere, and that when he founded Merton college, he removed the warden and priests thither.

MESMER, FREDERIC ANTHONY, a German physician, who was the author of the celebrated doctrine of animal magnetism. He was born at Mersburg in Suabia in 1734, and first made himself known in 1766 by the publication of a thesis, "*De Planetarum Influxu*," in which he maintained that the heavenly bodies exercised an influence on the bodies of animals, and especially on the nervous system, by means of a subtle fluid diffused through the universe. But this whimsical association of the Newtonian philosophy with the reveries of astrologers being too abstruse for general reception, he added the notion of curing diseases by magnetism, and went to Vienna to put his ideas in practice. Father Hell had previously performed some pretended cures by the application of magnets, and he, considering Mesmer as a rival, charged him with borrowing, or rather stealing, his invention. The new empiric thought it prudent, therefore, to renounce the use of common magnets, and declare that his operations were conducted solely by means of the magnetism peculiar to animal bodies. He had little success at Vienna, and his applications to the academies of sciences at Paris and Berlin, and the royal society of London, were treated with neglect. After an abortive attempt to cure Mlle. Paradis, a celebrated blind musician, by the exercise of his art, Mesmer quitted Vienna for Paris in 1778. There he for some time in vain endeavoured to attract the notice of men of science; but at length he succeeded in making a convert of M. Deslon, who, from being his pupil, became his rival, and whom he then represented as an impostor. Mesmer had the impudence to demand from the French government the gift of a castle and estate as a reward for his pretended discoveries; and the baron de Breteuil actually carried on a negotiation with this pretender, offering him a large pecuniary reward if he would establish a magnetic clinicum, and instruct three persons chosen by government in his process. The latter condition induced him to reject the proposal, and he removed, with some credulous patients, to Spa. A subscription was opened to induce him to return to Paris and reveal the principles of his professed discovery. He consequently went thither, gained a number of proselytes, and received 340,000 livres. Government at length appointed a committee of physicians, and members of the academy of sciences, among whom was Franklin, to investigate the pretensions of Mesmer; and the result of their inquiries appeared in an admirable memoir drawn up by M. Bailly, which completely

exposed the futility, of animal magnetism, and the quackery of its author. He afterwards resided some time in England, under a feigned name, and then retired to Germany, and in 1799 published a new exposition of his doctrine, which attracted no notice. He died at his native place in 1815. He was the author of "*Mémoire de F. A. Mesmer sur ses Découvertes*," and some other works.

**MESSALINA, VALERIA.**—This notorious Roman empress, who was the daughter of Messala Barbatus, and wife to the emperor Claudius, has left behind her the infamy of having surpassed, in licentiousness, the most abandoned women of any age. She had all the males belonging to the household of the emperor for her lovers; officers, soldiers, slaves, players—nothing was too low for her. Not satisfied with her own shame, she even compelled the most noble Roman ladies to commit, in her presence, similar excesses. Whosoever did not comply with her wishes she punished with death. She at length went so far as, during the lifetime of her husband, publicly to marry Caius Silius, a senator. Narcissus, a freedman and favourite of the emperor, formerly a paramour of the empress, discovered to Claudius, who was then absent from Rome, this new act of infamy on the part of Messalina; but Claudius delayed to punish her, and Narcissus, seeing that his own life was at stake, if the empress should succeed in recovering the favour of her weak and infatuated husband, gave orders to his friends to murder her secretly; this took place A. D. 46.

**MESSENIUS, JOHN**, was a Swedish historian, born in 1584. He was in the confidence of the great Gustavus Adolphus, and became professor of law and politics at Upsal. His fame exposed him to envy, and his enemies accused him in 1615 of corresponding secretly with the German emperor Sigismund, on which he was sentenced to imprisonment for life. He died in confinement in 1637. Of his writings, the principal is "*Joan. Messenii Scandia Illustrata, seu Chronologia de Rebus Scandiæ, hoc est Sueciæ, Daniæ, Norwegiæ*," &c. His son Arnold was executed in 1651, on account of a libel against the queen and the senate. This libel was written by John, son of Arnold, who was then but seventeen years old.

**MESSIER, CHARLES**, an astronomer, born at Badonville, in Lorraine, in 1730, and went to Paris at the age of twenty, and was employed by the astronomer Delille, in copying and drawing maps. Delille, who was struck with his zeal in the study of astronomy, obtained a situation for him, and, in 1758, the observation of the comet, which then occupied the attention of astronomers, was entrusted to him. He was one of the first to discover the comet whose return Halley had predicted in 1759; and he carefully observed the newly-discovered planet Uranus. A telescope, a quadrant, and a pendulum, were his only instruments. His sight was remarkably keen, and enabled him to discover objects of search before other observers. The revolution deprived him of his former appointments, but he continued his observations through the reign of terror, and was afterwards appointed a member of the institute, of the board of longitude, and of the legion of honour. He died in 1817. His observations are contained in the *Mémoires* of the academy and in the "*Connaissance des Temps*."

**MESTON, WILLIAM**, a burlesque Scottish poet, who was born in the parish of Midmar in Aberdeen-

shire, in 1686. He received a liberal education at the Marischal college in Aberdeen, and, after finishing his studies, became one of the teachers in the high school of New Aberdeen. Thence he removed into the family of Marshal, to be preceptor to the young earl of that name; and in 1714, by the interest of the countess, was appointed professor of philosophy in the Marischal college. He did not long retain this situation, for, when the rebellion broke out in 1715, he followed the fortunes of his noble patrons, who made him governor of Dunotter Castle. After the defeat at Sheriffmuir, he lurked among the mountains, till the act of indemnity was passed, with a few fugitive companions, for whose amusement and his own he composed several burlesque poems. He appears to have remained steady to his principles, and consequently was not restored to his professorship; but, while the countess of Marshal lived, resided chiefly in her family, where his great pleasantry and liveliness made him always an acceptable guest. After her death he must have been for some time without much provision, till he commenced an academy at Elgin, in conjunction with his brother. His imprudence, however, rendered this attempt abortive, and he subsisted on the bounty of his friends till his death, which took place in 1745. He was the author of the celebrated poems entitled "*Mother Grim's Tales*," and some Latin poems of less merit. Meston was an excellent classical scholar, and one of the best mathematicians of his college.

**MESUE**, a name given to the author of several ancient Arabic works on medicine, which were early translated into Latin. They are founded on the principles of Galen, and enjoyed great authority for a time, in the middle ages, and were commented upon down to the sixteenth century. There is much uncertainty respecting the name itself, and the life of the author. It seems necessary to suppose the existence of two physicians of this name, an elder one, who was body physician to the caliph Haroun al Raschid, and to several other caliphs, and died at Bagdad about A. D. 851. Haroun al Raschid, and his successor, Almamon, employed him to translate several works from the Greek. The younger Mesue was born in the eleventh century. He is said to have been a Christian, and a pupil of Avicenna. His works on medicine, translated into Latin, were common text-books in the medical schools of the middle ages, and were commented upon as late as the seventeenth century.

**METO, or METON**, a celebrated mathematician of Athens, who flourished 432 B. C. In the first year of the eighty-seventh Olympiad, he observed the solstice at Athens, and published his cycle of nineteen years, by which he endeavoured to adjust the course of the sun and moon, and to make the lunar and solar years begin at the same point of time. This is called the golden number, from its great use in the calendar. Meton was living about 412 B. C., for, when the Athenian fleet was sent to Sicily, he escaped a share in that disastrous expedition by counterfeiting insanity.

**METTERNICH, CLEMENS WENCESLAUS NEPOMUK LOTHARIUS, PRINCE OF METTERNICH.**—This celebrated politician and diplomatist was born May 17, 1773, at Coblenz on the Rhine. In 1788 he entered the university of Strassburg. At the coronation of the emperor Leopold II. he was one of the masters of ceremonies, after which

he studied law at Mentz until 1794, came to England, went to Vienna, became Austrian minister at the Hague, and married in 1795 the countess Eleonore von Kaunitz, grand-daughter of Prince Kaunitz. This lady was the heiress of the lordship of Austerlitz. She died in March 1825 at Paris. The prince then married Antonio, Countess de Beitstein, who died in 1829, and he has since married the countess Melaina Zichy, daughter of Count Zichy Ferrares. Prince Metternich began his diplomatic career at the congress of Rastadt, as minister of the college of the Westphalian counts, and in 1801 the Austrian court appointed him minister at Dresden. He was the chief agent in uniting Austria, Prussia, and Russia, by the treaty of Potsdam, against Napoleon, for which he received the grand cross of the order of Stephen. In 1807 he signed at Fontainebleau the convention, which put a stop to the disputes occasioned by the occupation of the *Bocche di Cattaro* by Russian troops, and which made the Isonzo the frontier of the kingdom of Italy. What he had begun in 1805 he continued in 1808 with rare activity and shrewdness. He never fully gave up his plans against France, because, whether republic or empire, the basis of the new order of things in France was odious to him, firmly attached as he was to the old system of feudalism or aristocracy, of which Austria may be considered the most obstinate champion; and, as Metternich was the most influential man in Austria, he will be one of the most interesting personages of this age to the future historian. Metternich followed his system with remarkable consistency and activity. Spain rose against France. In 1808 that public audience took place in which Metternich withstood, for about an hour, the warm attacks of Napoleon on the policy of Austria, which he declared would not leave him at peace. The campaign of 1809 broke out, and, shortly before the battle of Wagram, Count Metternich arrived in Vienna, from which he proceeded to the court of the emperor of Austria at Comorin. Passports had long been denied him at Paris. Count de Stadion resigned his place as Austrian minister of foreign affairs, and Count Metternich was appointed in his place. He and the French minister Champagny conducted the negotiations for peace at Hungarian Altenburg. Napoleon's proposal for the Austrian princess took place in 1810, and Metternich accompanied the new empress to France. When the war in the north began it was Austria's difficult task to manage affairs, so that, in spite of all treaties and obligations and the family relations, she should stand in a position to reconquer her former dominions and set Europe free from French influence. Baron Fain in the "Manuscrit de 1813," attacks the conduct of Austria on this occasion. Metternich must be allowed to have displayed great talent in this critical state of things. Austria's "armed mediation" was acknowledged by Alexander and Prussia, after a conference of Metternich with the former at Opotschna. Invited by Napoleon to Dresden, Metternich arrived and signed a treaty, according to which France also acknowledged the mediation. Metternich conducted the mediation in Prague. But the negotiations for peace not having been opened by the term fixed, which was the 10th of August, Metternich drew up the declaration of war on the part of Austria against France; and, on the morning of the 11th the Russian and Prussian troops marched over the Bohemian and Silesian

frontier. On the evening of the portentous battle of Leipsic, the emperor of Austria bestowed on him and his heirs the dignity of prince. He was active in the negotiations at Frankfort, Freiburg, Basle, Langres and Chaumont. He directed the negotiations at the head-quarters of the emperor Francis during the congress of Chatillon, and from Dijon the negotiations with Monsieur, afterwards Charles X., who had arrived at Nancy. He proceeded to Paris, signed the convention of Fontainebleau with Napoleon and the peace of Paris, after which he was sent to London. The university of Oxford conferred on him the degree of doctor of laws, and when in 1814 the congress of Vienna was opened, and the presidency was unanimously assigned him, with Talleyrand and Wellington he proceeded to the king of Saxony, then at Presburg, in order to effect peace between Saxony and Prussia, by obtaining a cession of territory from the former to Prussia. He was again Austrian plenipotentiary at the second peace of Paris in 1815; then at Milan, to conclude the treaty with Bavaria, which was ratified on the 14th of April, 1816. In 1817 he accompanied the Austrian princess destined for the Portuguese prince-royal (Don Pedro) to Leghorn, and then negotiated with the Roman see. He presided at Troppau and Laybach. He afterwards went on the invitation of George the Fourth to Hanover, and again conducted the negotiations at Vienna and Verona. In September 1823, when the emperors Francis and Alexander met at Czernowitz, Prince Metternich was prevented by sickness from partaking in the deliberations, but soon after transacted business with the Russian minister, Count Nesselrode. He continued in his post with unabated activity, and one of his latest works was the treaty between Austria and Sardinia, according to which the latter power engaged to keep 60,000 men in readiness for Austria in case of war, probably in return for an assurance, on the part of Austria, that she will make no further attempts to wrest the crown from the present king of Sardinia, as it is well known that she strove to exclude him, when Prince Carignano, from the succession, and to secure the crown for the duke of Modena-Reggio, an arch-duke of Austria. Prince Metternich has been knight of all the highest orders of Europe, with the exception of that of the garter. The king of Spain bestowed on him the dignity of a grandee of the first class with the title of duke. In 1816 the king of the Two Sicilies made him duke of Portella with 60,000 *ducati* income. In 1816 the emperor Francis presented him with Johannisberg, where the best hock is produced. Though actively engaged in the foreign affairs of his country, Prince Metternich has also taken a great part in the internal, as the management of the finances, &c. The prince has three children, two daughters and one son, who was born in 1829.

METZU, GABRIEL, a painter, born at Leyden in 1615, and lived in Amsterdam, where he died in 1658. His models were Douw, Terburg, and Mieris. His style, however, was nobler. He painted subjects from common life,—fruit-women, chemists in the laboratory, physicians attending the sick, &c. His manner is free and pleasing, and his imitation of nature true. A lady tuning her lute, and another washing her hands in a silver basin held by her woman, are among his best works.

MEULEN, ANTONY FRANCIS VAN DER, a battle painter, born at Brussels in 1634. Some of

his compositions, having been carried to France, attracted the notice of Lebrun, and Colbert invited the young artist to Paris, with a pension of 2000 livres, and a residence at the Gobelins manufactory. His talents as a battle painter recommended him to Louis XIV., who always took him on his expeditions, and often pointed out the subjects which he desired him to represent. The painter had thus an opportunity of perfecting himself in his department of the art, and is considered, on account of his truth of expression, one of the best battle painters of his day.

MEZERAI, FRANCIS EUDES DE, an eminent French historian, who was born at Argentau in 1610, and educated at the university of Caen, where he displayed a considerable share of talent as a poet. Indeed he supported himself for some time by writing satires against the French ministry during the minority of Louis XIV. He subsequently, however, gave his genius a better direction, and devoted himself to the study of history and politics. He published the first volume of his "History of France" in 1643, which extends from Pharamond to Charles VI.; the second in 1646, which contains what passed from Charles VI. to Charles IX.; and the third in 1651, which comprehends the history from Henry III. till the peace of Vervins in 1598; all in folio. This history procured him a pension from the king. In 1668 he published "An Abridgement of the History of France." He subsequently produced several other works, and died on the 10th of July, 1633.

MIAULIS, ANDREW VOKOS, a modern Greek leader, who was originally a poor sailor, but gained some property by his boldness and activity in the coasting trade. During the wars of the French revolution and those of Napoleon, he carried on a commerce with the French and Spanish ports in spite of the English cruisers, built the first ship at Hydra, but was shipwrecked on a voyage to Portugal, with the loss of all his fortune. He however recovered from his losses, and was held in great esteem by his countrymen. Though averse to beginning the struggle for Greek freedom at the moment when it was commenced, the first blow was no sooner struck than he embarked heartily in the cause, and was ever foremost in exposing himself, in sacrificing his fortune, and in giving an example of obedience to the government, and of disinterestedness. "Such is the man," says Howe, "who commanded the Greek fleet; and so irreproachable was his character, that even in Greece, where the people are so suspicious of their leaders, no voice was ever raised against Miaulis."

MICHAELIS, JOHN DAVID, a celebrated theologian and orientalist, who was born at Halle in 1717, where his father, Christian Benedict, was a distinguished professor of the same branches. Young Michaelis received his first instruction from his father, and afterwards studied in the orphan house at Halle. After taking his degrees, he made a journey to England and Holland, where he formed connections with several learned individuals in London and Oxford, and in Leyden. After his return to his native country, he prosecuted his studies with great ardour, and, in consequence of the death of Professor Ludwig, was entrusted with the preparation of a catalogue raisonné of the Halle university library. Through the influence of the baron von Münchhausen, Michaelis in 1745 was made professor of philosophy at Göttingen, where, in 1751, he was appointed, with Haller, to draw up the constitution of

the new royal society of sciences, of which he was secretary and director, until some differences with one of his colleagues induced him to resign his posts and leave the society. From 1753 to 1770 he was one of the editors of "The Göttingen Literary Notices," and from 1761 to 1763 was librarian to the university. After the death of Gesner, which took place in 1761, he undertook the direction of the philological seminary, from which so many eminent philologists have proceeded. During the troubles of the seven years' war, Michaelis was employed in making preparations for an exploring expedition into Arabia, which was afterwards undertaken by Niebuhr, and which contributed many important explanations to obscure passages of scripture. He died in 1791. His labours in biblical criticism and history are of great value. His principal works are, "Mosaisches Recht," "Introductions to the Study of the Old and New Testaments," "Spicilegium Geographiæ Hebræorum," "Translations of the Old and New Testaments, with Grammatical and Lexicographical Productions."

MICHAUD, JOSEPH.—This French royalist was well known as a violent partisan of the Bourbons. He was born in 1771, and in 1791 went to Paris, where he immediately began to write in the royalist journals. He was obliged to conceal himself during the reign of terror; and, under the directorial government, he was several times imprisoned, and was once condemned to death by a military commission. At the time of his condemnation he was the editor of "The Quotidienne." He took flight, but the sentence being subsequently annulled he returned, and was among the persons who were ordered to be transported to Cayenne, but he contrived again to escape, and found a refuge in the mountains of the Jura. Of these events he has given an amusing account in a poem, entitled "The Spring of a Proscribed Man." During the reign of Napoleon, M. Michaud was the secret agent of Louis XVIII. and the count D'Artois. He however celebrated the marriage of the emperor and Maria Louisa, in a poem called "The Thirteenth Book of the Æneid, or the Marriage of Æneas and Lavinia." Napoleon nevertheless, who suspected him to be an enemy, would never grant him any favour. Louis XVIII. appointed him one of his supplementary readers, censor-general of the journals, and officer of the legion of honour. After the second abdication of the emperor, M. Michaud was elected a member of the chamber of deputies, but sat during only one session. He was the author of many pamphlets and poems, and of "A Literary Journey to Mont Blanc, and in Some Picturesque Parts of Savoy," "History of the Empire of Mysore," "The History of the Crusades," and of a great number of articles in "The Universal Biography."

MICHAUD, LOUIS, was a younger brother of Joseph Michaud, and served in the army till he had attained the rank of captain during the early campaigns of the revolution; but in 1797 gave up his commission, in order to settle at Paris as a partner with M. Giguet in the printing business. He and his partner being royalists, their press was frequently employed in printing papers sent to them by Louis XVIII. and his brother; and for an offence of this kind M. Michaud, in 1799, suffered three months' imprisonment in the Abbaye. After the restoration M. Michaud became king's printer. In 1816 however he lost his place, in consequence of his having printed various publications hostile to the charter

Michaud was the author of "An Historical View of the First Wars of Napoleon," and the publisher of the celebrated "Biographie Universelle."

MICHAUX, ANDRE, a celebrated traveller and botanist, who was born at Sartory, near Versailles, in 1746, and was early led, by the example of his father and his own inclinations, to devote himself to agricultural pursuits, but at the same time did not neglect to cultivate the sciences and polite literature. The loss of his wife, soon after an early marriage, interrupted his prospects of domestic happiness, and carried him to Paris, where he became acquainted with Lemonnier, and acquired a taste for botany. He attended the lectures of Jussieu, and in 1780 visited Auvergne, the Pyrenees, and Spain, in company with Delamarck and Thouin, on a botanical excursion. In 1782 Lemonnier obtained for him permission to accompany Rousseau, who was appointed Persian consul to Persia, and after spending two years in those parts, Michaux returned with a fine collection of plants and seeds. In 1785 he was sent to America for the purpose of sending out trees and shrubs for the establishment at Rambouillet, landed at New York, and visited New Jersey, Pennsylvania, and Maryland, &c. In 1787 he formed a new establishment at Charleston for the procuring and preserving plants, and visited Georgia, Florida, the Bahamas, &c. Shortly after which he examined the more northern parts of the continent, to the vicinity of Hudson's Bay. The two gardens which he had established at New York and Charleston were now in a flourishing condition, and had done much towards advancing arboriculture in the United States. Soon after his return to Philadelphia, Michaux was sent to Louisiana by the French government on a public mission, and, in July 1793, crossed the Alleghanies, and descended the Ohio. The project in relation to which he had been sent having been abandoned, he returned in December to Philadelphia. The following year he again crossed the mountains, and examined the western parts of the United States. The difficulties which he had to encounter in these expeditions may be easily imagined. In 1796 he returned to Europe, was shipwrecked on the coast of Holland, but saved the greater part of his valuable collection, and, on his arrival in Paris, found that out of 60,000 stocks which he had sent out to Rambouillet, only a very small number had escaped the ravages of the revolution. Michaux was unable to obtain the arrears of his salary for seven years, or any employment from the government, and occupied himself in preparing materials for his works on North America. In 1800, however, he was attached to the expedition of Baudin to New Holland; but, after visiting Teneriffe and the Isle of France, he left the party, and went to Madagascar, where he died of a fever in November 1802. His best works are, "*Histoire des Chênes de l'Amérique Septentrionale*," and "*Flora Boreali-Americana*."

MICKLE, WILLIAM JULIUS.—This eminent poet was born at Langholm in Dumfriesshire towards the close of 1734. He received a good classical education from his father, who was a very pious presbyterian minister, and afterwards placed him in the high school at Edinburgh. At twenty years of age young Mickle commenced business as a brewer, but ultimately failed, and he speedily became an author by profession. To procure the patronage of Lord Lyttleton he presented him with copies of

several of his works, and his lordship furnishes the following remarks on "Mary Queen of Scots, an Elegy:"—

"As to the poem on the death of Mary queen of Scots, I will not criticise any part of it, because I wholly disapprove the subject: poetry should not consecrate what history must condemn; and it is as certain as history can render any fact, that (besides her criminal amours with David Rizzio and Bothwell) she was an accomplice in the murder of the king her husband. Read Thuanus or Hume (who have written her history more truly than Robertson) and you will be inclined to pity, not to praise her; nor will Robertson himself, though he shades her crimes as much as possible, give you such an idea of her as to make you think her a proper subject for the encomiums of a writer who means to serve the cause of virtue, not of party."

In reply to his patron's letter, Mickle wrote the following:—"Though you have disapproved of the ode on the queen of Scots, I must think myself very happy in having shown it to your lordship. Nothing was ever farther from my thoughts than to vindicate or deny her crimes; and if, while taken up with the subject, I have fallen into what might be looked on as endeavouring to give an amiable cast to her vices; now, when your lordship has been so good as to warn me of it, I can have no reluctance to suppress a piece that was merely a sport of fancy. That Buchanan, Knox, and others, have sometimes forgot the honour of the historian, and indulged the rancour of party, is pretty certain. This, with the greatness of her sufferings (in some instances beyond what the most crooked policy could demand), pleads something in her favour, and it was this that misled me to think of writing an ode on her death, without sufficiently weighing the propriety of the subject. I would fain take this opportunity," he adds, "to mention the plan of a poem, which I have long had some thoughts of. The subject of it, if not the title, to be, *The Cave of Deism*. Mr. Hume has asserted, that Mahometanism has been more salutary to the world than Christianity. And through all his works there runs a most disingenuous manner of blending revelation with the fopperies and sinister inventions of men; and in a variety of such ludicrous dresses, he would expose Christianity to the contempt of his reader. Such a conduct, with his shameless assertion that Polytheism was the first religion of mankind; his malevolence of the reformation; the nonsense he writes about miracles; together with such like sentiments from other infidel writers, would furnish out a part or character for the keeper or genius of the cave. The description of the gloomy cave itself, with the vices that shelter in it;—the genius of Mahometanism, with the finest countries lying in ruins behind her;—that of popery, and that of genuine Christianity, introduced as personages, with some proper action, might, I should think, afford materials for a poem of five or six hundred lines, which would fall naturally enough into the manner of Spenser."

Mr. Mickle afterwards took occasion to state the nature of his pursuits, and the obstacles which retarded his progress, in a letter to the same nobleman. It is dated April 9th, 1765.

"A situation that would enable me to cultivate the studies to which nature has led my inclination, was all the happiness I ever wished for; but any weak

attempt I have made has neither procured such, nor left much hope of it doing so. To write for the booksellers is what I never will do. Did my fortune enable me to do for myself in trade, I might expect some encouragement under Governor Johnstone, of West Florida, to whose family my father was related; but as I prefer going abroad to any thing I could expect in a counting-house in London, I think I have reason to hope that Major James Johnstone, brother to the governor, will befriend me so far as to procure me, if in his power, some settlement in the East or West Indies. The risk of being cut off by the climate," he adds, in another place, "would no wise deter me from going to Jamaica, did it otherwise appear as the most proper step I could take, in which case your lordship's recommendation to Beckford or Fuller, and mentioning me to your brother, the governor, would be every thing I could wish. But as your lordship likewise mentioned the East Indies, and, as next to a clerkship in some of the public offices at home, I should prefer going thither, so I should be very happy could any thing be done in it. The company have many resident clerks, and various places to bestow, and no doubt your lordship's interest with the directors would do a great deal."

After various commercial arrangements, none of which were fully matured, Mr. Mickle accepted of an appointment as corrector of the Clarendon press at Oxford, in which office he remained many years.

The favourable reception of his early poems induced him to publish, in 1770, three distinct productions:—"Mary Queen of Scots, an Elegy;" "Knowledge, an Ode;" and "Hengist and Mey, a Ballad." As he had signified a desire to suppress the poem on the death of Mary queen of Scots, in consequence of the disapprobation of his former patron, Lord Lyttleton, he conceived it necessary, on its appearance, to obviate the objection adduced by his noble friend to his vindication of her character, for which purpose he affixed the following note to the conclusion of the elegy:—

"Many elaborate attempts have been made to rescue the character of the beautiful but unfortunate Mary from obloquy and reproach. The artifices of her insidious but inexorable rival, Elizabeth, have been clearly laid open by the masterly pen of Dr. Stuart. Elizabeth was undoubtedly the enemy of her fame, her fortune, and her life. Yet the conduct of the queen of England may be considered as in a great measure justified by the alarming combinations of Mary and her abettors; by the general circumstances of the times, and of the two countries; and by the rebellious disposition of a considerable portion of her subjects, exasperated by the suppressed but malignant bigotry of the old superstition, and ready to seize every opportunity of disturbing the reign of their triumphant enemy."

Having opposed Dr. Harwood with some success in a theological disquisition, he published in 1771, "Voltaire in the Shades, or Dialogues on the Deistical Controversy," in which he gave evident proofs of learning and genius, as well as a mind disposed to promote the most essential interests of mankind. To add to the stipend he received as corrector of the Clarendon press he frequently wrote essays for the "Whitehall Evening Post;" but as economy is not a virtue generally attendant on genius, the produce of his labours united did not amount to what he deemed a competence, by which he was induced to

extend his views and conceive a design that might improve his income. In early life he had read, with great attention, Castera's translation of "The Lusiad" of Camoens into French, and entertained a distant thought of attempting a version of it into English. He did not abandon the intention though he had been precluded by a variety of engagements from the execution of it, till at length he formed the resolution of making an effort at the arduous task, and having previously acquired a competent knowledge of the Portuguese language, he entered upon it, and through the utmost exertion of his abilities, published in 1771 the first book as a specimen of his talents for that department of literature. His friends approving this specimen, and encouraging him to proceed in an undertaking which augured so favourably at the commencement, he dismissed all other engagements, determined to devote all his time and all his powers to the accomplishment of a design which afforded a rational prospect of conducting most essentially to his emolument as well as his reputation.

Pursuant to this determination he left his residence at Oxford and retired to a farm house at Forest Hill, where he applied himself with such unremitting assiduity to the accomplishment of his plan, that the translation, which had been sent to the press in stated portions as he proceeded on it, was completed in 1775, and published under the title of "The Lusiad, or the Discovery of India, an Epic Poem; with an Introduction, the History of the Discovery of India, the History of the Rise and Fall of the Portuguese Empire in the East, the Life of Camoens, a Dissertation on the Lusiad, and Observations upon Epic Poetry, and Notes and Illustrations."

This arduous work made its appearance under many unfavourable circumstances. Sir Richard Fanshawe had published a translation of "The Lusiad" in 1655, but the style in which it was executed afforded a very imperfect display of the excellencies of the original. In a letter to a friend, dated January 22nd, 1776, he says, "Though my work is well received at Oxford I will honestly own to you some things have hurt me. A few grammatical slips in the introduction have been mentioned, and some things in the notes about Virgil, Milton, and Homer have been called the arrogance of criticism. But the greatest offence of all is what I say of blank verse. My versification, however, receives a most general approbation."

In a letter to Mr. Boswell, preserved in his "Life of Dr. Johnson," he says, "Before publishing 'The Lusiad' I sent Mr. Hoole a proof of that part of the introduction in which I make mention of Dr. Johnson, yourself, and other well-wishers to the work, begging it might be shown to Dr. Johnson. This was accordingly done, and in place of the simple mention of him, which I had made, he dictated to Mr. Hoole the sentence as it now stands. Dr. Johnson told me, in 1772, that about twenty years before that time he himself had a design to translate 'The Lusiad,' of the merit of which he spoke highly, but had been prevented by a number of other engagements." Dr. Johnson, it is said, afterwards recommended it to Goldsmith.

During the greater part of the five years which Mickle chiefly devoted to the translation of "The Lusiad," he derived his sole support from the stipend he received from his employer as corrector of the Clarendon press; and when he gave up that engage-

ment he was circumscribed to the residue of the sum he had received from the subscription to his work. "When, after five years unremitting attention," says the writer of the anecdotes of his life, "he had completed this great work, those friends who knew his circumstances advised him to consider who would be the proper patron to whom he ought to dedicate such a poem. I am assured by one who lived with him in habits of great intimacy (the Rev. Mr. Sims, of Chenies, Bucks, formerly of St. Alban Hall, Oxford), that Mr. Mickle had repeated intimations from unquestionable authority, informing him that, to several persons, then high in the Indian department, it would be very acceptable; that by the dedication of such a poem as 'The Lusiad,' they would think themselves highly honoured, that he might depend on a princely acknowledgment, and they therefore advised him to think of the most worthy. This counsel he was at first inclined to, but the advice of Commodore Johnstone turned the scale, and it was dedicated to the duke of Buccleugh."

"That he might omit," says the anonymous writer of the best account of his life, "no prudential attentions to his future welfare; and, with the hopes of reaping those advantages which usually attend so laborious a work, he applied to a person of great rank, with whom his family had been connected, for permission to dedicate it to him. 'The manner,' says the author, 'in which ——— took the English 'Lusiad' under his patronage infinitely enhanced the honour of his acceptance.' The manner, as the author frequently told his friends, was 'by a very polite letter written with his own hand.' But let not indigent genius in future place too much expectation on the generosity of patrons. After receiving a copy, for which an extraordinary price was paid for the binding, days, weeks, and months elapsed without the slightest notice. During this time, though the author had too much spirit to solicit or complain, it is to be feared that some of the misery so feelingly described by Spenser fell to his lot:—

\* Full little knowest thou, that hast not tried,  
What hell it is in suing long to bide,' &c.

"At length a gentleman of rank in the political world, a fast and firm friend to the author, and who afterwards took him under his protection, and by that means afforded him the independence he latterly enjoyed, waited on the patron, and heard, with the indignation and contempt it deserved, a declaration that the work was then unread, but had been represented not to have the merit it had been first said to possess, and therefore nothing could be then done on the subject of his mission. This paltry evasion, the solicitor declared, he believed arose from the malicious insinuations of a certain person about the patron, whose mistakes had received a proper correction in the preface to 'The Lusiad.' We know not how true this suggestion may be, though, admitting the fact, it hardly alters the case. Mr. Mickle's account of this interview in a letter to a friend, dated August 22, 1776, now lies before us, and we might probably do no disservice to the general interests of literature were we to print it. We cannot, however, omit to suggest a doubt whether there is not some small violation of moral rectitude in a great man accepting from an indigent one that compliment which is offered him, under at least an implied agreement to receive some acknowledgment in return for the honour done him? It ought not to be concealed

that when the second edition of 'The Lusiad' was published in 1778, Mickle was strongly recommended by a friend to suppress the dedication. His resentment at the unworthy treatment he had received had by this time been converted into contempt, and with great magnanimity he refused. Whoever will read the life of Camoens cannot avoid observing a striking similarity in the fortunes of the author and his translator, and he will probably not be displeased at the concluding note of 'The Lusiad':—"Similarity of condition produced similarity of complaint and sentiment in Spenser and Camoens: each was unworthily neglected by the Gothic grandees of his age; yet both their names will live when the remembrance of the courtiers who spurned them 'shall sink beneath their mountain tombs.'"

\* O may that man that hath the muses scorn'd,  
Alive, nor dead, be ever of a muse adorn'd."

"I believe," says the writer of the anecdotes of his life, "the person alluded to is Dr. Adam Smith, who was the professed admirer of Hume, to whom Mickle was a declared antagonist, and once intended to have written and published 'An Heroic Epistle from David Hume to Dr. Adam Smith,' in which the doctor and his pupil would have been rather harshly treated. Many of the verses he at the time repeated to a particular friend, but the poem was never completed." Such was the reception of Mickle's dedication of "The Lusiad."

That Mickle entertained anxious doubts of the success of his translation, is evident from some remarks in the dissertation prefixed, reflecting on the poverty and misery in which Camoens, the author of "The Lusiad," was suffered to drag through a wretched existence, which he concludes with some lines in the style of Spenser, on the "Neglect of Poetry." But such was the merit of the poem in point of adherence to the ideas of the original, of fancy, and harmony of versification, that it obtained an applause beyond his most sanguine expectations, and totally dispelled the momentary apprehensions which had arisen in his mind from some disappointments he had experienced previous to the publication. The first edition having a very rapid sale, he immediately prepared a second with improvements, which was published with an etching presented to him by Mortimer; in gratitude for which, Mickle at his death, which happened in 1779, wrote an epitaph for him, which does equal honour to the poet and the artist.

Before the appearance of "The Lusiad," Mickle, at the persuasion of some friends, was induced to make an effort in dramatic poetry, and wrote a tragedy entitled "The Siege of Marseilles," founded on a passage in the French history of the reign of Francis I., when the duke of Bourbon, at the head of an army of Spaniards, invaded his native country, and laid siege to the city of Marseilles. This tragedy, with the recommendation of some literary friends, was submitted to Mr. Garrick, who, after perusing it, acknowledged, in a letter to a friend, "that it contained many beautiful passages;" but remarked, "that fine writing was not of itself sufficient to constitute a drama for public exhibition." Governor Johnstone, the warm friend and liberal patron of Mickle, unwilling that he should have taken so much pains without the least reward, solicited Mr. Home, author of "Douglas," to revise the tragedy, and make such alterations as to him might seem necessary. Mr. Home readily complied with his re-

quest, and the piece, with the alterations, having been inspected by Mr. Warton, was again rejected, at which the poet was so incensed that he resolved to appeal to the judgment of the public by printing it; and as soon as the first sheet came from the press, sent it to the manager. The reason he assigns for printing the tragedy is given in the preface to it; the motive for the latter is described in a letter to Mr. Hoole, dated November 15, 1773:—

"I have just received a letter from Mr. Ballantyne wherein he acquaints me, that you seemed sorry that Mr. Garrick had seen a proof sheet of the preface to my play. Mr. B. also expresses his surprise how he should have obtained it, and supposed that some person who wished me ill had sent it, that he might be prepared to prejudice the public against me.

"The truth is, I sent it to him in a blank cover. Let him be prepared as he will. Half a year ago I declared my resolution to my friend Mr. Boswell. He wrote me two earnest dissuasive letters, but in vain. I have maturely considered every circumstance; I have passed the Rubicon, and I will proceed. In a letter to Mr. Boswell, sent off only three days ago, I told him that I should look upon any farther dissuasive as thus, in plain English: 'What, do you think the public will mind such a scribbler as you? No, my friend, take my advice, fold your hands together, submit to the infallibility of Mr. Garrick, and starve.' I have also cited the same sentence in a letter, now on the table, to Governor Johnstone. I have passed the Rubicon I say, but I am not a Kenrick. No friend shall blush for me. I know what I owe to them, and to myself. If I am possessed of any satirical abilities, Mr. G. shall feel them. I have planned a new "Dunciad," of which he is the hero. As soon as I finish 'The Lusiad,' I will set about it. If you think proper, you may mention this in any company."

Mickle, thus disappointed in his application to the monarch of Drury, was inclined to try the fate of his piece in the Edinburgh theatre, but was prevailed on by the persuasion of his patron, Governor Johnstone, to lay it aside till his translation was completed, that it might not impede his progress in a work, the result of which was infinitely more important, both with respect to the advancement of his fame and fortune. When "The Lusiad" was finished, approved, and his reputation consequently enhanced, at the instance of a friend, he revised his tragedy, and submitted it to Mr. Harris, proprietor of Covent Garden theatre, but it met with the same fate as on the former occasions. Thus repulsed, he abandoned all hope of emolument from the theatre, though he was afterwards prevailed on to permit a person to present the ill-fated play to Mr. Sheridan, who became one of the proprietors of the theatre on the retirement of Mr. Garrick; but it was rejected by him on the same ground as by the other managers; yet such was the attachment of the author to his favourite though discarded child, that he always avowed his resolution of printing and inserting it in the collection of his works.

He published in 1779 a pamphlet entitled "A Candid Examination of the Reasons for Depriving the East India Company of its Charter, contained in the History and Management of the East India Company, from its Commencement to the Present Time; together with Strictures on some of the Self-Contradictions and Historical Errors of Dr. Adam Smith in his Reasons for the Abolition of the said

Company." This production obtained him the favour and protection of many persons of opulence and influence, who were inclined to recommend him to the notice of his majesty as deserving of a pension. Dr. Lowth, bishop of London, a prelate eminent for his learning and candour, from an approbation of his talents and general character was inclined to admit him into orders, and promise him some provision in the church; but he declined the clerical profession as not agreeable to his disposition.

During the time he was concerting the plan for publishing his works by subscription, from which, through the liberality and recommendation of his friends, he entertained sanguine hopes of deriving very considerable emolument, his patron, Governor Johnstone, who was appointed to the command of the Romney man-of-war, as well as commodore of a squadron, offered to make him his secretary, in order that he might be entitled according to rank to share in such prizes as might be taken in the course of an intended cruise; but so scrupulously did he regard the forfeiture of his word pledged to his friends in his proposals for a subscription, that he could not be prevailed upon to accept the offer till it was very pertinently suggested to him that, by a new situation in life, he would enter upon new scenes, form new connexions, and extend his interest, so as to render the publication more acceptable to his subscribers, and profitable to himself. Convinced by these arguments he engaged with the commodore, and on his arrival at Lisbon was appointed joint agent for the prizes that might be taken. The reputation he had acquired by his translation of "The Lusiad" procured him the esteem of the principal people in Lisbon and its environs, by whom he was honoured with every mark of respect and esteem, during a residence of more than six months. He employed his vacant time while he continued in Portugal in the composition of a poem, which he entitled "Almada Hill, an Epistle from Lisbon," and the collection of some materials for an account of the history, manners, and customs of the Portuguese; but as these materials were never arranged, the account could not be rendered sufficiently correct for publication. Through the interest of his patron, the commodore, and the reputation he had acquired as a man of letters, he had the honour of being admitted a member of the royal academy, under the presidency of one of the most illustrious characters of the age, Prince Don John of Braganza, who presented him with his own portrait as a token of his esteem. The commodore, on his return from Lisbon, was appointed to the command of an expedition to the Cape of Good Hope; but as Mickle, who came with him to England, was from the nature of his office under the necessity of staying in London to attend the proceedings in the courts of law respecting the condemnation of some prizes, he could not accompany his patron.

In 1782 he published an ironical pamphlet in defence of Chatterton. It was called "The Prophecy of Queen Emma, an ancient Ballad, lately discovered, written by Johannes Turgottus, Prior of Darham, in the reign of William Rufus; to which is added by the Editor, an Account of the Discovery and Hints towards a Vindication of the Authenticity of the Poems of Ossian and Rowley." Having been enabled by the fortune he acquired in the situation to which he had been appointed by his patron and steadfast friend, Commodore Johnstone, to retire to literary leisure

with an independence, he married Miss Tomkins, daughter of the person with whom he resided at Forest Hill—during the time he was engaged in the translation of “*The Lusiad*,” and took a house at Wheatly, a few miles from Oxford, where he passed his vacant time in the revision and correction of his poetical works, and particularly his favourite tragedy, in order to prepare them for an intended publication by subscription.

He continued, during the remainder of his life, his attachment to literary pursuits, and, during the last seven years of it, sent occasional essays to the “*European Magazine*,” composed a poem called “*The Fragments of Leo*,” and afforded considerable assistance to the reviewers. At the request of a friend he wrote, in 1788, a song called “*Eskdale Braes*,” in honour of the country of his birth, a country most beautifully Arcadian, in the centre of that district on the border of Scotland which is thus described by Dr. Percy, in his “*Reliques of Ancient English Poetry*”:—“Most of the finest old Scottish songs have the scene laid within twenty miles of England, which is indeed all poetic ground, green hills, remains of woods, and clear brooks. The pastoral scenes remain; of the rude chivalry of former ages happily nothing remains but the ruins of the castles.” This song, in commemoration of a spot in itself of little importance, but dignified by the birth of heroes who have bled in defence of their country, and poets who have given new harmony to the language, was set to music by James Balmain.

This was the last composition he lived to finish; for after a short illness he died in Oxfordshire, October 25th, 1789, and was buried at Wheatly.

His “*Poems*,” including the pieces formerly printed separately, except “*Providence*,” with the “*Sorcerer*,” and other original pieces, and the tragedy of the “*Siege of Marseilles*,” were collected and published by subscription in 1794, with some anecdotes of his life, in which are comprised several letters from the late Lord Lyttleton, with the benevolent purpose of raising a sum to assist the education, and make some additional provision for his son. His poems, reprinted from the edition of 1794, with his verses “*On passing through the Parliament Close of Edinburgh at Midnight*,” and some smaller pieces selected from the “*Introduction to the Lusiad*,” and the anecdotes of his life, were afterwards received into a collection of classical English poetry. His poem on “*Providence*” he himself thought too incorrect for republication.

Of Mickle’s original compositions his “*Almada Hill*” deservedly holds the highest rank. He opens the poem with a well-drawn picture of a joyless winter day in England, contrasted with the genial influence of a warmer clime. After hinting at what will probably be the cause of our political decay, he enters more immediately upon the subject of the poem, which abounds with local picturesque views by land and sea, and historical incidents, from the time of the Romans to the great earthquake in 1755. The descriptive parts are, he tells us, strictly local, and they have every appearance of being truly characteristic and appropriate. After cursorily pointing out the “*mighty deeds the lofty hills of Spain of old have witnessed*,” he notices the change of manners that has prevailed in consequence of the subversion of the Roman empire, by the irruption of the Goths and other northern tribes; and, though the causes

he assigns for that peculiar character which has since marked each of the different divisions of Europe, may not be historically true, yet the ideas he has started on this subject are at least poetical and ingenious. The diseased chivalry of romance is contrasted with the chivalry of wisdom and honour, as he styles the religious fury of crusading, which many have imputed to the influence of his prejudices. The fall of Lisboa’s naval throne occasions some boding thoughts on that of London. The naval glory of the Portuguese, during the time they first established themselves in Asia, and the fate of Gama, have their due place; with the massacre of the Moors at the taking of Lisbon, that of the Jews and Christians in 1505, the revolution that set the duke of Braganza on the throne, a sublime description of the earthquake, &c. The duke of Latoens receives a high eulogium in the conclusion, for his taste in the belles lettres, history, &c. The general poetical merit of the epistle is very considerable. The sentiments may sometimes be thought exceptionable, but the versification is spirited and harmonious; though it would have been more so had he less frequently made one verse run into another. In attempting bold innovations in language, he has, in some instances, violated metaphorical propriety. But a good notion of the general style of the poem may be best acquired by an extract, and for that purpose we select one which partakes of its highest beauties:—

“O’er Tago’s banks, where’er I roll mine eyes,  
The gallant deeds of ancient days arise;  
The scenes the Lusian Muses fond display’d  
Before me oft, as oft at eve I stray’d  
By Isis’ hallowed stream. Oft now the strand  
Where Gama march’d his death devoted band,  
While Lisboa aw’d with horror saw him spread  
The daring sails that first to India led;  
And oft Almada’s castled steep inspires  
The pensive Muse’s visionary fires;  
Almada Hill to English memory dear,  
While shades of English heroes wander here!  
“To ancient English valour sacred still  
Remains, and ever shall, Almada Hill;  
The hill and laws to English valour given  
What time the Arab Moors from Spain were driven,  
Before the banners of the cross subdued,  
When Lisboa’s towers were bath’d in Moorish blood  
By Gloster’s lance—romantic days that yield  
Of gallant deeds a wide luxuriant field,  
Dear to the Muse that loves the fairy plains  
Where ancient honour wild and ardent reigns.  
“Where high o’er Tago’s flood Almada low’rs,  
Amid the solemn pomp of mouldering towers,  
Supinely seated, wide and far around  
My eye delighted wanders.—Here the bound  
Of fairest Europe o’er the ocean rears  
Its western edge; where dimly disappears  
The Atlantic wave, the slow descending day  
Mild beaming pours serene the gentle ray  
Of Lusitania’s winter, silvering o’er  
The tower-like summits of the mountain shore;  
Dappling the lofty cliffs that coldly throw  
Their sable horrors o’er the vales below.  
Far round the stately-shoulder’d river bends  
Its giant arms, and sea-like wide extends  
Its midland bays, with fertile islands crown’d,  
And lawns for English valour still renown’d:  
Given to Cornwallia’s gallant sons of yore,  
Cornwallia’s name the smiling pasture bore;  
And still their lord his English lineage boasts  
From Rolland famous in the Croisade hosts.  
Where sea-ward narrower rolls the shining tide  
Through hills by hills embosom’d on each side,  
Monastic walls in every glen arise  
In coldest white fair glistening to the skies  
Amid the brown-brow’d rocks: and, far as sight,  
Proud domes and villages array’d in white  
Climb o’er the steepes, and through the dusky green  
Of olive groves, and orange bowers between,  
Speckled with glowing red, unnumber’d gleam—  
And Lisboa, towering o’er the lordly stream,  
Her marbled palaces and temples spreads  
Wildly magnific o’er the loaded heads  
Of bending hills, along whose high-piled base  
The port capacious, in a mooned embrace,

Throws her mast-forest, waving on the gale  
The vanes of every shore that hoists the sail."

**MIDDLETON, ARTHUR**, a distinguished American patriot in the revolutionary war of America, who was of a highly respectable English lineage. His grandfather Arthur was a man of high standing and great influence in the colony of South Carolina; and his father, Henry, was one of the presidents of the first continental congress. The son was born in the year 1743, on the banks of the Ashley river, South Carolina, and sent, at an early age, to England, to be there educated. He was first placed at Harrow-on-the-Hill, whence, at the age of fourteen, he was transferred to that of Westminster. In both he made great proficiency in the Greek and Latin classics. Having passed regularly through Westminster school, he was entered, between the age of eighteen and nineteen, in Trinity college, Cambridge. He left this institution in his twenty-second year, with the reputation of a sound scholar and moral man. After visiting many parts of England, he passed two years in making the tour of Europe.

In 1773 he fixed his residence at his birth-place, and in the following year he engaged warmly on the side of the colonies, in the disputes between them and the mother country. As a member of the first council of safety chosen by the provincial congress of South Carolina, he advocated and suggested the most vigorous and decisive measures. After serving on the committee to prepare and report a constitution for South Carolina, he was elected by the assembly one of the representatives of the state in the congress, then convened at Philadelphia. In this capacity he signed the declaration of independence. He and Hancock formed a joint domestic establishment, and exercised a munificent hospitality, which was deemed salutary in uniting socially the members from the two extremities of the union. Mr. Middleton held his seat until 1777, always strenuous in the cause of independence. The post of governor of South Carolina was offered to him in 1778, but he declined it because he could not approve the new constitution which was that year framed for the state. In 1779 he distinguished himself in the defence of Charleston against the British, who afterwards ravaged his plantation and rifled his mansion. In the following year he became a prisoner of war, in November 1780 was sent to St. Augustine, and in 1781 was included in a general exchange of prisoners, and sailed for Philadelphia. Soon after his arrival in that city he was appointed by the governor of South Carolina a representative in congress. In 1782 the general assembly of the state elected him to the same station. When the revolutionary contest terminated, Mr. Middleton returned to his native state. He afterwards served in the legislature of South Carolina, for the purpose of effecting a reconciliation of parties. The remainder of his life was spent in elegant and philosophical ease. Mr. Middleton incurred an immense loss of property by his course during the revolution. In November 1786 he was seized with an intermittent fever, which caused his death, January 1787.

**MIDDLETON, CONYERS**, a learned English divine and polemical writer, who was born at York in 1683, and was the son of an episcopal clergyman. He became a student and afterwards a fellow of Trinity college, Cambridge, in which situation he attracted some notice by his quarrel with the celebrated

Dr. Bentley, the master of his college. In 1724 he visited Italy, and, on his return, published a tract designed to show that the medical profession was held in little esteem by the ancient Romans; and in 1729 appeared his letter from Rome, on the conformity between popery and paganism. Not long after he obtained the Woodwardian professorship of mineralogy, which he held till 1734, when he was chosen librarian to the university. In 1735 he published "A Dissertation respecting the Origin of Printing in England;" but his greatest literary undertaking was "The History of the Life of Cicero," in which he displays an intimate acquaintance with his subject, accompanied with a degree of elegance in his style and language which entitle him to rank among the principal modern historians of England. In 1743 he published "The Epistles of Cicero to Brutus, and of Brutus to Cicero, with the Latin Text and English Notes, a Prefatory Dissertation," &c., and four years later Dr. Middleton published his "Free Inquiry into the Miraculous Powers which are supposed to have subsisted in the Christian Church from the Earliest Ages through several successive Centuries." This treatise brought on the author the imputation of infidelity, and occasioned a warm controversy, which was continued after his death, in 1750.

**MIDDLETON, SIR HUGH**, a patriotic citizen of London, who was the son of Richard Middleton, governor of Denbigh Castle under Edward VI., Mary, and Elizabeth. Young Middleton came to London and commenced business as a goldsmith, and at the same time worked a mine in Cardiganshire, which was very profitable. As London at that period was very ill supplied with water, three acts of parliament were obtained for the purpose of improving that department of domestic economy; one in Queen Elizabeth's, and two in King James the First's reign;

granting the citizens of London full power to bring a river from any part of Middlesex and Hertfordshire. The project, after much calculation, was laid aside as impracticable, till Sir Hugh Middleton undertook it: in consideration of which, the city conferred on him and his heirs, in April 1606, the full right and power of those acts of parliament. Having therefore taken an exact survey of all springs and rivers in Middlesex and Hertfordshire, he made

choice of two springs, one in the parish of Amwell near Hertford, the other near Ware, both about twenty miles from London; and, having united their streams, conveyed them to the city with very great labour and expense. The work was begun on the 20th of February, 1608, and carried on through various soils. Many bridges in the mean time were built over the New River, and drains were made to carry off land-springs and common sewers. Besides these necessary difficulties, he had, as may easily be imagined, many others to struggle with. When he had brought the water into the neighbourhood of Enfield, almost his whole fortune was spent; upon which he applied to the corporation of London; but they refusing to interest themselves in the affair, he applied next to King James. The king, willing to encourage the work, agreed to pay half the expense of the whole work past and to come. The river was now carried on rapidly, and the water was brought into the cistern at Islington on Michaelmas-day 1613. Like most other projectors, Sir Hugh greatly injured his fortune by this stupendous work; for though King James had borne the principal part of the expense, and afterwards granted his letters patent to Sir Hugh Middleton and others, incorporating them by the name of "The Governors and Company of the New River, brought from Chadwell and Amwell to London," and empowered them to select a governor, deputy-governor, and treasurer, to grant leases, &c., yet the profits at first were very inconsiderable. There was no dividend made among the proprietors till the year 1630, when 11*l.* 19*s.* 1*d.* was divided upon each share. The second dividend amounted only to 3*l.* 4*s.* 2*d.*, and instead of a third dividend, a call being expected, Charles I. re-conveyed it again to Sir Hugh, by a deed under the great seal, in consideration of Sir Hugh's securing to his majesty and his successors a fee-farm rent of 500*l.* per annum, out of the profits of the company. In the mean time, although Sir Hugh was a loser in point of profit, yet he was a gainer in point of honour; for the king made him first a knight, and then a baronet, for the services he had done to the city of London, in supplying it with that most necessary of all articles—pure water. Sir Hugh died in 1631.

MIDDLETON, THOMAS FANSHAW, a learned English divine, who was born in 1769, and educated at Cambridge, where he took his degree in 1792. Having entered holy orders he became curate of Gainsborough in Lincolnshire, where he carried on a periodical paper called "The Country Spectator."

In 1808 Dr. Middleton established his reputation as a scholar by the publication of his celebrated "Treatise on the Doctrine of the Greek Article, applied to the Criticism and the Illustration of the New Testament;" a work which will ever be considered as a text-book in that department of Greek literature. The following year appeared "Christ Divided; a Sermon preached at the Visitation of the Lord Bishop of Lincoln."

In April 1812 he was collated by the bishop of Lincoln to the archdeaconry of Huntingdon; and in the autumn of the same year he directed his attention to the deplorable condition of the parish of St. Pancras, in which he found a population of upwards of 50,000 persons, with only the ancient very small village church, which could not accommodate a congregation of more than 300. On this occasion he published "An Address to the Parishioners of St.

Pancras, Middlesex, on the intended Application to Parliament for a New Church." When government came to the resolution of establishing a resident bishop of India, Dr. Middleton was selected for that eminent situation. He was consecrated at Lambeth in May 1814, and arrived at Calcutta in the November of the same year. Among the objects to which Dr. Middleton's attention was particularly directed, we must notice his desire to increase the number and efficiency of the chaplains in India, and to provide churches for the accommodation of the European residents. He recurred to each of these points in his several charges, and but a short time before his death he congratulated his brethren upon the partial success which had attended his efforts and representations. Dr. Middleton was mainly instrumental in founding the mission college at Calcutta, for the following purposes: 1. For instructing native and other Christian youth in the doctrine and discipline of the church of England, in order to their becoming preachers, catechists, or schoolmasters; 2. For teaching the elements of useful knowledge, and the English language, to Mussulmen and Hindoos, having no object in such attainments beyond secular advantage; 3. For translating the Scriptures, the Liturgy, and moral and religious tracts; 4. For the reception of English missionaries on their first arrival in India, for the purpose of acquiring the languages.

The illness which led to Dr. Middleton's lamented death was short, but severe. On Tuesday, the 2nd of July, 1822, he paid a visit to the college, which is distant about five miles from Calcutta. Here he appeared in the full possession of his usual health and spirits. Soon after he felt one of those strokes of the sun which are so common in an Indian climate. A violent head-ache came on; but, though he was persuaded to take some strong medicines, he would not suffer any medical man to be called in. He seemed from the first to labour under the irritation which arose from the weight of business pressing upon him; and, on that very account, he was the more anxious to work night and day to accomplish what he had in hand. Accordingly, the next day, he sat at his desk eight hours, answering various papers, during which time the disease was making rapid inroads upon his frame. At night he allowed a physician to be sent for, who pronounced him to be in the most imminent danger. On Sunday, by his own express desire, he was prayed for by his congregation at the cathedral. On the evening of Monday the physician left him under the impression that he was decidedly better. He had not, however, been long gone, when the bishop was again seized with a violent paroxysm of fever; he walked about in great agitation: soon afterwards, his strength gave way, the final scene came rapidly on,—and at eleven o'clock on the night of Monday, the 8th of July, 1822, he ceased to breathe.

In no man could there be a more singular union of all those various qualities which were each so essential to the success of the first Indian prelate, than in Dr. Middleton. His mind was naturally ardent and excursive, but it was always under the control of the most disciplined and calculating discretion. He had a masculine and a practical understanding: he rapidly conceived the most extensive plans, and would digest with facility even their most circumstantial details; but he never anticipated their season, or hurried their execution: he waited with

patience till in the course of passing events a favourable opportunity should arise, and when at last it presented itself, he marked it with decision, and he seized it with effect. So singular indeed was his judgment, that amidst the various difficulties with which he was daily and hourly doomed to contend, he never made a step which he was afterwards obliged to recall. His talents and attainments were of a superior order: he was a sound and accurate scholar, and in the prose department of Greek literature he was perhaps without a rival. His conversation was vigorous, sometimes even playful; his style was luminous and forcible, not abounding in imagery, but rising perpetually into a manly and a chastened eloquence. As a preacher he was powerful and convincing; his mind was theological, and his expression scriptural. The leading points, however, in his character, which threw a clearness and a brilliancy over every other, were the singleness of his views and the simplicity of his heart. In the course of his Indian career he had but one object—the advancement of the cause of Christianity in the east—to that he dedicated his days and his nights, his hopes and his fears, his money and his influence. Labours so disinterested, and services so pure, were not rejected—the blessing of the Almighty was upon them, and the work of the gospel prospered in his hand.

**MIERIS, FRANCIS**, a celebrated painter of the Dutch school, who was the son of a jeweller at Leyden, where he was born in 1635. He was the pupil of Vliet, Gerard Douw, and Van den Tempel, and he is generally considered as the principal scholar of the second. His works consist of portraits, and scenes in common life. He possessed the delicate finish of Gerard Douw, with more taste in his designs; his colouring, too, is more clear, and his touch more spirited. He usually worked for a ducat an hour; but, through his intemperance, he always remained in poverty. One of his finest productions was a picture of a young lady fainting, a physician attempting to recover her, and an old woman standing by; and for this 3000 florins were vainly offered by the grand-duke of Tuscany. Mieris died at Leyden in 1681.—He had two sons,—John Mieris the elder, who gave great promise of excellence, but died in 1690 at Rome: the younger, William Mieris, was the pupil of his father, and adopted his style, in which he showed great talent. He died in 1741.—His son, Francis Mieris, the younger, was also a painter, but was not very successful. He published several works relating to the history of the Low Countries, and the lives of their sovereigns.

**MIGNARD, PIERRE**, a French painter, who was born at Troyes in 1610. His father, discovering early indications of his talent for painting, placed him, when eleven years old, at Bourges, in the school of Jean Boucher; and the young artist next studied the works of Primaticcio, Rosso, and Nicolò dell' Abbate, in Fontainebleau. He afterwards became a pupil of the celebrated Vouet, and in 1636 went to Rome, where he formed himself by the study of the masterpieces of Raphael and Titian. His historical paintings and portraits, among which were those of Urban VIII. and Alexander VII., soon gained him reputation; and he also painted a great number of portraits in Venice. In 1658 Colbert engaged him to return to France in the service of Louis XIV., and Mignard was placed at the head of the academy of St. Luke, and, after the death of Lebrun, with whom

he was constantly at war, became chief painter to his majesty. At this time he executed one of the greatest fresco paintings which France possesses—the dome of the Val-de-Grace. It represents the region of the blest: in the centre of a great number of saints, martyrs, prophets, &c., was placed Queen Anne of Austria presenting to the Creator a model of the new church. He also adorned the palace of St. Cloud with numerous mythological paintings, executed several works at Versailles, and painted portraits, &c. Besides the posts already mentioned, the direction of the royal collections of art, of the academy of painting, and of the Gobelin manufactory, was conferred on him. He continued actively engaged in his art until his death in 1695. In respect to invention and composition, Mignard is not entitled to rank among profound and original geniuses; yet the grace and loveliness which characterize his works, particularly his Madonnas, the brilliancy and harmony of his colouring, and the ease of his pencil, atone for many defects. His talent for imitation of other masters was remarkable; he deceived the ablest judges, and, among them, his rival Lebrun, by a Magdalene in the style of Guido.

**MIGNOT, STEPHEN**, a learned French writer, who was born in 1698, and educated for the church. As an author he is best known by his work "On the Rights of the Monarch and the Civil Government over the Revenues of the Church." Mignot died in 1771.

**MILDMAY, SIR WALTER**, an English statesman, who was employed under Henry the Eighth in the court of augmentation. He also sat in parliament during the reign of Mary, and became chancellor of the exchequer on Elizabeth ascending the throne. This able and learned statesman was the founder of Emmanuel College, Cambridge, and died at an advanced age in May 1589.

**MILL, HENRY**, an engineer of considerable talent, who for many years held the post of principal surveyor to the New River Company. He was celebrated for his acquaintance with the science of hydraulics, which knowledge he employed in the erection of several large works. He died in 1770, in the eighty-first year of his age.

**MILL, JOHN**, an English divine, who was born at Shapp, in Westmoreland, in 1645, and educated at Oxford. Having entered holy orders, he was presented to a living in Oxfordshire, and at a later period became chaplain to Charles the Second. Dr. Mill's great work was a valuable edition of the New Testament, which appeared under the title of "Novum Testamentum Græcum, cum Lectionibus Variantibus, ex MSS.," &c. He survived the publication of this work only a fortnight, dying of apoplexy in 1707.

**MILLAR, JAMES**.—This gentleman, who is well known as the author of several important works on the science of botany, was a native of Scotland. His education was obtained chiefly at the university of Glasgow, where he signalized himself by the extent and accuracy of his acquaintance with the classics, and his taste for the varied departments of natural history. Removing thence to Edinburgh, where he took the degree of M. D., he published "Observations on the Advantages and Practicability of Making Tunnels under Navigable Rivers." He also superintended a new edition of the "Encyclopædia Britannica," and the "Encyclopædia Edinensis;" and in 1819 he published "A Guide to Botany;"

in addition to which Dr. Millar produced several other popular works. He died in 1827.

MILLAR, JOHN, a Scottish writer, who was born in 1735, and became professor of law in the university of Glasgow. As a writer he is best known by his works on the origin of the distinction of ranks, and his "Historical View of the English Government." Professor Millar was a staunch Whig of the old school, who adopted Fox as their leader. He died in May 1801.

MILLAR, PHILIP.—This popular botanical writer was a native of Scotland, and distinguished among his contemporaries by the flattering title of "Hortulanorum Princeps." He was born in 1691, and educated by his father, who was gardener to the apothecaries' company at Chelsea, to succeed him in his situation, which he did, on the decease of the latter in 1722. Mr. Millar was an excellent practical botanist, and was a fellow of several of the scientific societies. His most celebrated works are, "A Gardener's Calendar," "The Gardener's and Florist's Dictionary," "An Introduction to Botany," and "A Catalogue of Trees, Shrubs, Plants, and Flowers, in the Gardens near London." His death took place in 1731.

MILLER, EDWARD, a musician of considerable talent, who was born at Norwich in 1736. He early in life became distinguished by his skill in music, and obtained the appointment of organist at Doncaster, where he wrote his "Elements of Thorough Bass," and "History of the Antiquities of Doncaster." He died in 1807.

MILLER, EDWARD, an eminent American physician and professor at New York, who was born at Dover in the state of Delaware, May 1760. In 1778 he commenced the study of medicine. He began practice in Delaware, but made himself advantageously known in other states by a disquisition on the origin of the yellow fever, one of the earliest and ablest publications in support of the doctrine of its domestic origin. In 1796 Dr. Miller removed to the city of New York. Within a few weeks after he formed, in concert with Dr. S. Mitchill and Dr. Smith, the plan of a periodical work to be devoted to medicine. The first number was issued in 1797 under the title of "The Medical Repository." No work of a similar kind had appeared in America. It excited medical enquiries and recorded their results. It occasioned the establishment of similar journals in other parts of the United States. Dr. Miller lived to see its fifteenth volume brought nearly to a close. In 1803 he was appointed resident physician for the city of New York. He witnessed, as such, several pestilential seasons. The fruits of his observation and reflection he embodied in a report on the rise, progress, and termination of the yellow fever, to which a high degree of merit is ascribed. In 1807 he was elected professor of the practice of physic in the university of New York, and in 1809 he became clinical lecturer in the New York hospital. Notwithstanding the laborious duties of those offices, and the calls of an extensive practice, he kept up an active correspondence with many distinguished physicians and men of letters in the principal parts of Europe and America, and professional honours were conferred upon him from all quarters. He died of typhus fever in March 1812, in the fifty-second year of his age.

MILLER, JOSEPH, a witty actor, who was born in 1684, it is supposed in London, and was a favour-

ite low comedian about the time that Congreve's comedies were fashionable, to the success of which, it is said, his humour much contributed. In these he performed Sir Joseph Wittol in "The Old Bachelor," and Ben in "Love for Love." Another of his favourite characters was Teague in "The Committee." He died in 1738. The jests which have immortalized his name were collected by John Mottley, author of the "Life of Peter the Great," and other works. "Joe Miller's Jests" has run through many editions, and a copy of the original edition was lately valued at ten guineas in the catalogue of an eminent bookseller.

MILLES, THOMAS, an English prelate, who was born at High Clear, Hants, and educated at Wadham college, Oxford. Having entered holy orders he became chaplain to Lord Pembroke, who was his steady friend for many years, and it was through his influence that Dr. Milles was elevated to the episcopal bench as bishop of Waterford. This able divine died in 1740, much regretted for his benevolence and blameless character.

MILLIN, AUBIN LOUIS, a celebrated professor of antiquities at Paris, who was born in Paris in 1759, and at first devoted himself to the study of natural history, but afterwards to that of philology, and finally to archæology. In his earlier writings he appeared as a partisan of republican principles; among these are his "Almanac Republicain," and other works, which he did not include in the latter catalogues of his publications. In the reign of Napoleon he made two antiquarian excursions in France and Italy, where he discovered several remains which had been overlooked by the Italians. Indeed he was one of the most learned archæologists that France has produced. He edited the "Magazin Encyclopédique" nearly twenty years. Among his principal works are his "Dictionnaire des Beaux Arts," "Monuments Antiques Inédits," "Galerie Mythologique," "Peinture des Vases Antiques," "Voyage dans les Départements du Midi de la France," "Histoire Métallique de la Revolution Française," "Histoire Métallique de l'Empereur Napoléon." His lectures, which were fashionably attended, contributed with his works to diffuse a taste for the study of antiquities in France. His services as *conservateur* of the cabinet of antiques, of which he made a systematic arrangement, also deserve to be remembered. He died in 1818.

MILLOT, CLAUDE FRANCOIS XAVIER, a learned and ingenious French author, who was born in 1726 at Besançon. He was educated at the Jesuits' college and became a member of that fraternity, but quitted it and settled at Parma, where the patronage of the duke de Nivernois obtained him the historical professorship. This situation he filled with much ability and reputation for some years, when the prince of Condé offering to his acceptance the appointment of tutor to the young duke d'Enghien, he returned to Paris. His works, some of which are much esteemed for the spirit and elegance of their style, consist of "A History of the Troubadours," "Memoirs, Political and Military, for the History of the Reigns of Louis XIV. and Louis XV.," "Elements of Universal History," "Elements of the History of England," "Elements of the History of France," besides some academical papers, and a few translations from the Latin. His death took place in the French capital in 1785.

MILLS, CHARLES, a writer of eminence, who

was born in 1788, and early in life directed his attention to oriental history. His first work, entitled "History of Mohammedanism," was published in 1819. It was followed by "A History of the Crusades." This work, taken up *con amore*, and executed with the spirit which an ardent love of the subject would naturally elicit, was no sooner published than its merits were appreciated. The condensed vigour of the style (in some favourite passages exuberant and stately as the language of Gibbon) was its chief recommendation with some; its strict fidelity with others; while all agreed in admiring the clear simplicity with which it was executed: this last was the result of Mr. Mills's long-cherished habits of continuous and unbroken meditation. He first conceived a subject well in his mind, scrutinising it in all its bearings with mathematical severity, and then, after having formed some particular opinion, brought all his immense mass of information to bear upon and justify that opinion, till the fabric grew under his hand a stately monument of intellect. Such a remark refers especially to his "Travels of Theodore Ducas, at the Revival of Letters and Art in Italy,"—a work of fiction, full fraught with learning, exhaustless in its variety and extent, yet applied with surprising ingenuity to its subject. The public, however, seemed to underrate Mr. Mills as a commentator on Italian literature, and accordingly, notwithstanding the splendour of particular passages, such as the criticism on Danté, and the account of an interview with Ariosto, the work was comparatively unsuccessful.

Mr. Mills then directed his attention to his greatest work, "The History of Chivalry, or Knighthood and its Times." This last had no sooner appeared than it was instantly successful; the first edition sold with almost the rapidity of a Scotch novel, and it was but a few months previous to his death that its author had completed his revision of a second. Shortly after its completion Mr. Mills's health began visibly to decline. For a long time he struggled with his malady, still hoping that his constitution might be finally re-established: but all his expectations were vain; he grew daily worse, and was compelled as a last resource to leave London for Southampton; where, after getting a little better, like the last flickering glimmer of the lamp, his health soon afterwards decayed and brought him to the grave, October 9th, 1826.

MILMAN, SIR FRANCIS, a talented English physician, who was born in Devonshire and educated at Exeter college, Oxford, by which university he was afterwards appointed a travelling physician on the Radcliffe foundation. While on his travels he attended the duke of Gloucester, which circumstance led to his great success as a medical practitioner on his return home. As an author he is best known by his "Animadversiones de Natura Hydropis." His death took place in June 1821.

MILNE, COLIN, a Scottish naturalist, who was a native of the town of Aberdeen, where he received his education, and having entered into holy orders, he obtained several church preferments; but it is as a naturalist that Dr. Milne is known in the literary world, and his works, which are almost all devoted to the science of botany, are still much admired. His most popular production is his "Botanical Dictionary." He died in 1815.

MILNER.—There are two distinguished churchmen bearing this name, no less celebrated for their

talent and erudition than for their extraordinary elevation from the humblest rank to the highest dignities in the church of which they were members.

Isaac Milner was a native of Yorkshire, having been born near Leeds, January the 11th, 1751. His parents could neither boast of rank nor property; for his father was a poor weaver, who died in great distress at an early period of life, leaving behind him Isaac, an elder brother, Joseph, and their aged and infirm mother, whom, greatly to their credit, they maintained for many years by means of their spinning-wheels. To unceasing labour they superadded, what is very uncommon in persons in their situations, an ardent love of study. Having no books of their own, they were supplied with a few by their neighbours, who, perceiving all these good qualities united with sobriety and discretion, prognosticated the future advancement of the family. Such, at length, was their reputation, that their fame extended to Leeds, where some of the most opulent and public-spirited of the inhabitants undertook to educate and send to college one of these young men. The elder brother, Joseph, was accordingly pitched upon, and under their patronage he became a day-scholar at the grammar-school in Leeds, for the period of three years. On his return home at night, he constantly imparted to his brother Isaac the lessons he had learned during the day. Thus Isaac soon obtained a tolerable acquaintance with the Greek and Latin languages. Notwithstanding this, he was now apprenticed to a weaver; but he softened the rigour of his fate by means of the Muses, whom he courted with renewed assiduity.

Meanwhile, his elder brother had finished his studies at Cambridge with great reputation. After this he entered into holy orders, obtained the curacy of Trinity church, Hull, and was nominated master of the free grammar-school of that place. Isaac, disgusted at the inglorious toils of a mechanic, was now sent for, and obtained the office of assistant, for the purpose of teaching the lower classes. He was then nineteen years of age, and had been accustomed to work at the loom with a Tacitus by his side. The prospects of this young man were soon turned towards the church; and, after assisting his brother some time as an usher, he removed to Queen's college, Cambridge, where he was entered a sizar. For his new station Mr. Milner was admirably fitted; and before he went to the university, he was allowed to have attained a senior optime's knowledge in algebra and mathematics. Possessed of useful ambition, he now aimed at the first honours of his college, and had talents and perseverance sufficient to obtain them. Accordingly, in the year 1774, he became senior wrangler, and also gained the first mathematical prize. In 1782 he served the office of proctor, and in 1792 was honoured with the vice-chancellorship. Intense study, however, had secretly laid the foundation of a nervous disorder, which undermined the sources of existence, and occasionally embittered the remainder of his life.

While at Cambridge, Mr. Isaac Milner became acquainted with Mr. Wilberforce, and is said to have tinged his mind with the peculiar opinions afterwards evinced by that gentleman on religious subjects. After a short acquaintance the two friends proceeded on a tour to the continent, accompanied by Mr. Pitt, but they had not travelled far before the last of these gentlemen was recalled, in consequence of

some political changes which afterwards elevated him to the premiership. The others accompanied him on his return, and an intimacy ensued, which continued for life. This occurred in 1788, in which year Mr. Milner was elected president of Queen's college. He now commenced some salutary reforms, and recollecting that when he was an under-graduate it was the custom of the sizars to wait behind the chairs of the fellows at dinner, he had spirit and good sense enough to abolish those servile distinctions, which were coeval with the monkish ignorance and superstition. In 1792 he took out his doctor's degree, and was presented with the deanery of Carlisle. At Hull he retained lodgings during the life of his brother. This became a favourite residence; and here he had a complete workshop, where he was accustomed to relax his mind daily from the fatigues of study. He found manual labour a great source of happiness, and spared no expense in obtaining the most perfect and expensive machinery. As a proof of this, the lathe and appendages for turning cost him no less than one hundred and forty guineas.

On the death of Dr. Waring in 1798, Dr. Milner was nominated Lucasian professor of mathematics, which office he held till the time of his death in 1820.

Joseph Milner is principally distinguished by his "History of the Church," and Sermons. After obtaining considerable church preferment, he died in 1797, aged fifty-two.

MILNER, JOHN, a learned catholic divine and theological writer, who was born in London in 1752. He received the rudiments of his education at the catholic schools of Sedgeley Park near Wolverhampton, and Edgbaston near Birmingham, and then went to the English college at Douay. Having completed his education, he was in 1777 ordained, and shortly after the library belonging to the chapter and clergy of the London district was placed under his care. He, however, quitted London in 1779, on being appointed pastor to the catholic chapel at Winchester. Dr. Milner's first publication was "A Funeral Discourse on the Death of the Venerable and Right Reverend Richard Challoner, Bishop of Debora, and Apostolic Vicar of the Southern District," who died January 12th, 1781; pronounced January 14th, 1781; printed in the year 1782. His next work was "A Letter to the Author of a Book called 'A Candid and Impartial Sketch of the Life and Government of Pope Clement XIV.'" His third publication was "George the Third, the Sovereign of the Hearts of his Subjects."

Dr. Milner's attachment to the study of ancient ecclesiastical architecture obtained him an introduction to the society of antiquaries, of which he became a fellow on the 18th of March, 1790, and in 1798 he published "A Dissertation on the Modern Style of Altering Cathedrals, as exemplified in the Cathedral of Salisbury." In this essay Dr. Milner particularised the various alterations which had been made in Salisbury cathedral, the monuments which had been removed, and the decorations which had been destroyed; painted a picture of the disgusting appearance of the recent fitting up of the church for the accommodation of those who had to perform divine service in it; and lamented the fatal example which was thus held out on a subject so deeply interesting.

It was not, however, until the latter end of the year 1798 that Dr. Milner published his great work,

"The History, Civil and Ecclesiastical, and Survey of the Antiquities of Winchester."

Dr. Milner visited Rome in 1814, and during his residence in that city had frequent opportunities of gratifying his love of architectural antiquities. The following narrative from the pen of the learned doctor gives a good notion of his epistolary style:—

"Rome, Oct. 28, 1814.

"My dear Friend,—You left me in the Christian capital on the 17th of this month, and my object then became, not indeed to forget you, for this were impossible, but to moderate the lively sense I felt at parting with you. For this purpose I resolved upon making a little tour through that part of the Appennines which lie to the east of Rome, and which I previously knew to be the most interesting portion of the stupendous range of mountains bearing this name. Accordingly, I left Rome on the day following that mentioned above, mounted on horseback, as was my servant, and I took the direction of Tivoli, the Tibur of the ancients, so much celebrated by Horace and his contemporaries. On this occasion I passed by, unnoticed, the Thermæ of Dioclesian, part of which now forms the celebrated church of St. Maria de Angelis, the venerable church of St. Lawrence *extra muros* (venerable on many accounts, but on none so much as for its possessing the mortal remains of the fellow-deacons and glorious martyrs, St. Stephen and St. Lawrence), the petrifying lake, of which the proofs exist in all the neighbouring walls, the sulphureous river, the stench of which infects the road to a considerable distance in each direction of it, and the boundless villa of Adrian. In short, after a tedious and scorching ride of eighteen miles, I arrived at the enchanting scenes of Tivoli; in comparison with which all others that I had hitherto seen were tame and uninteresting. I speak not of the town itself, which, like the other small towns of Italy, is dirty and inconvenient, (I cannot however complain, upon the whole, of the inn, called from its situation the Sybil's Temple, as I there met with civil usage and good fare), but I speak of the mountains, the woods, and the waters; of the vineyards, the palaces, and the villas; of the temples, namely, those of Tussis, Vesta, and the Sybil; the habitations of Catullus, Vespasian, and Horace; but, above all, of the thundering cascade, the spray of which mounts high in the air, and forms an unceasing rain; the broad lofty cascata, and the terrific grotto of Neptune.

"Near this villa, now a convent of Franciscans, I met the present great and good prefect of the Propaganda, Cardinal Litta, with his retinue, a nobleman of Milan, who, having devoted himself to God and the church, serves them with equal zeal, ability, and disinterestedness. His business lying with persons of different nations, he is enabled to converse with Englishmen, Frenchmen, Germans, Russians, and Greeks, with the same facility as with Italians. His eminence condescended to accompany me to my inn, and conversed with me for a considerable time. To speak the truth, I find the cardinals, and superior prelates, in general, well-informed and sensible men, engaging and edifying in their manners, and taken up with the duties of their respective charges.

"Having spent two days at Tivoli, I shaped my course eastward, towards Sublacum, now called Subiaco, a most interesting spot to the Christian antiquary, but mostly neglected by modern tourists. Having passed by Vicovara, I found myself obliged,

for the sake both of man and horse, to stop at one of the wretched inns which here and there are to be met with in the wild mountains I was traversing. The one in question, though the best of its kind, consisted of one large cave, crowded with mules, horses, asses, and their drivers, with a dresser at the farther end of it, where the landlord and landlady sold coarse bread, sour wine, and horse food. The rain coming on, namely, such rain as is usual in this country, resembling a river poured down from the clouds, I thought I should have been obliged to pass the night in this cavern, where a bare board would have been my only bed; but, as the rain ceased for a short time, I again mounted my steed, and hastened with as much celerity as the alternate sloughs and rough loose marble stones, of which the road consists, would permit, towards Subiaco. At length, however, I became convinced of the utter impossibility there was of my reaching that place while the light continued, and of the very great danger of travelling through such roads in the darkness of the night. I therefore, by the advice of my servant, turned out of the road to a castle and town, at the distance of two miles from it, called Arzoli. The only inn here was as bad as the one I had left; but one of the most respectable inhabitants of the place, hearing that a traveller was arrived there to pass the night, sent for me to partake of his liberal hospitality, both at board and bed, which he bestowed with a benignity and assiduity as if he was receiving, instead of conferring, a benefit. I never can forget my worthy host, Signor Angelus Marcelli, with his good and edifying wife, brother, and sister, nor that generous confessor of the faith, the present arch-priest of Arzoli. You will form a judgment of the style in which I was received and entertained here, when I tell you that a band of music, consisting of eight performers, was provided to honour my *déjeûné* and taking horse the next morning. Nor was my visit confined to pleasure, having here met with a most curious subject of antiquarian information; namely, the only ancient Roman milestone which is known to exist. It is a round marble column, about six feet high, and two feet in diameter, which stood in the Via Valeriana, marking its present distance from Rome in the following manner:—

‘XXXVIII.

‘Imperator Nerva—Cæsar Augustus

Pontifex Maximus—Consul IIII—Pater Patriæ—  
Faciendam Curavit.

“I had now twelve miles to ride through a road, the greater part of which the late Pope Pius VI. had made, and tolerably good compared with that which I had hitherto travelled from Tivoli; but among such lofty, rough, and bare mountains, here and there surmounted with ancient castles, or ruined cities, that no scenes in Derbyshire or Wales can furnish an idea of this part of the Appennines. At length on turning the flank of a mountain, the beautiful site and edifices opened to my view. The hills were in some places covered with olives, and other fruit-bearing trees; in others, with various well-grown forest trees; the valleys were watered by the serpentine folds of the murmuring Teverone, and divided into rich vineyards and gardens. These, with the noble entrance-gate, the spacious house of the missions, the well-built cathedral and seminary, the episcopal castle, placed on the point of a steep cloud-piercing rock, and the numerous surrounding villas,

could not fail to delight the eye, and render the situation of this city highly interesting, however poor and inconvenient the streets and houses of the common inhabitants, like those of other country towns here, are in general. For my own part, however, I found here the comforts of a decent inn, with civil usage, at the hotel of Signior Benedict Cali, which were greatly increased by the hospitality of the amiable bishop of the city, then making his episcopal visit there, Cardinal Galeffi.

In 1818 Dr. Milner published a treatise entitled “The End of Religious Controversy; or, a Friendly Correspondence between a Religious Society of Protestants and a Roman Catholic Divine,” addressed to the right rev. lord bishop of St. David’s, in answer to his lordship’s “Protestant Catechism.” This is pronounced by Mr. Butler, in his “Book of the Roman Catholic Church,” to be “the ablest exposition of the doctrines of that church on the articles contested with her by protestants, and the ablest statement of the truths by which they are supported, and of the historical facts with which they are connected, that has appeared in our language.” Dr. Milner’s death took place on the 19th of April, 1826, and he was buried in his chapel at Wolverhampton on the 27th of the same month.

MILO, a native of Crotona in Italy, was one of the most celebrated Grecian athletes. He bore off the prize six times in the Olympic games. Of his prodigious strength many instances are cited. When the temple in which Pythagoras was teaching his pupils was on the point of falling, Milo seized the main pillar, and delayed the destruction of the edifice until all present had escaped. He once carried a bull to the sacrifice on his shoulders, and killed it with a blow of his fist. His strength, however, was the cause of his death. Seeing in a forest a strong trunk of a tree, which it had been in vain attempted to split with wedges, he determined to pull it asunder; but his strength was insufficient. The wedges which had kept the cleft open had dropped out, and he remained with his hands fastened in the fissure. No one coming to his assistance, he was devoured by wild beasts.

MILORADOWITCH, MICHAEL ANDREE-WITCH, COUNT OF, a distinguished Russian officer, who was born in 1770, and rose rapidly in the army. In 1808 he fought victoriously against the Turks, and in 1812 organized the first *corps de reserve*, and led it to the main army before the battle of Mojaïsk. He was of great service during this whole campaign against the French, as also in the succeeding war in 1813. He contributed essentially to the victory of the allies at Culm, commanding under the grand prince Constantine, a *corps de reserve*, consisting of Prussian grenadiers and cuirassiers, and the Russian and Prussian guards. In the battle of Leipsic he was again active, and marched with the armies into France. After the peace he was appointed military commandant of St. Petersburg. In the insurrection of the troops in 1825, at the ascension of the emperor Nicholas, he was killed by a pistol-shot. As an active commander of vanguards he had few equals.

MILTIADES.—This distinguished Greek leader was a native of Athens and the descendant of a noble family. His father, named Cimon, was one of those high-minded Athenians who, in the time of Pisistratus, could not brook obedience to the tyrant, and

quitted his country in consequence of that feeling. The magnanimity of Pisistratus however soon induced him to return, and he was afterwards slain in a domestic tumult in the city. Cimon left two sons, Miltiades and Stesagoras; the latter was soon called to a higher station than that which either his father or himself had filled in Athens. The sons of Cimon had an uncle named Miltiades, who, by his own merits, and in consequence of the dictates of the Delphian oracle, became prince of the Thracian Dolonces, the inhabitants of a part of Chersonesus; and dying without issue, his nephew Stesagoras succeeded him in that sovereignty. The reign of Stesagoras was short; he was slain by a blow from an axe, given by an enemy disguised in the dress and accoutrements of a deserter; and dying, like his uncle, without issue, Miltiades, the celebrated Athenian general, became entitled to the throne and property of his brother. He was a favourite at this time with Pisistratus, the sovereign of Athens; and that prince, ever the friend of monarchy, assisted him with a small army to support his title. With one ship only he sailed to take possession of his new government; and, perceiving the necessity of stratagem, on his arrival in the Chersonesus, he absented himself from the public shows, and affected a particular seclusion, pretending grief for the death of Stesagoras, and a desire to do honour to his memory. By this artifice he collected, to condole with him, all the principal persons from the neighbouring cities; an event for which Miltiades had duly prepared. The murder of his father Cimon is said to have been contrived or perpetrated at Athens by the very persons whom he now found in his power; they were therefore seized and imprisoned by order of Miltiades, and his path to the throne was secured from danger. Miltiades now found himself the undisputed master of Chersonesus. He immediately formed a body-guard of 500 auxiliaries, and allied himself by marriage with Olorus king of Thrace. In the third year of his government Darius, in resentment of certain alleged injuries he had received from the Athenians, made retaliation on all Greece and the neighbouring countries; when the Scythian nomades, or wandering tribes, either irritated by some injuries they had received from the Persian expedition, or taking advantage of the general state of confusion and alarm which it occasioned, assembled in great numbers on the borders of Chersonesus, and desolated the country around, indiscriminately, whether under the Persian dominion or in alliance with the Greeks. This was a force which Miltiades found himself unable to withstand, and he prudently retired until the storm should blow over. According to the customary mode of warfare with the Scythians, they plundered the Chersonesus without attempting to maintain it, but soon suffered it to revert to its former prince; and Miltiades was reinstated in his power by the Dolonces. A short interval of peace succeeded; but in the third year after his restoration Darius, provoked, perhaps, by the known attachment of Miltiades to the Athenians, sent a powerful army of the Phœnicians against him; and the hero, surrounding himself with his friends, and collecting all his riches, finally abandoned his dominions, and set sail with a fleet of five ships for Athens. The Athenians had been prepared to receive the royal fugitive with honour. He had never, in the course of his sovereignty over Chersonesus, forgotten his connexions with his native soil;

BIOGRAPHY.—VOL. II.

and, on one occasion, had rendered Athens a considerable service. The inhabitants of the island of Lemnos having been admonished by the Delphian oracle to compose their differences with the Athenians by an absolute submission, the Lemnian ambassadors are said to have answered contemptuously, that "they would comply when a ship from the Athenian dominions should be blown into their harbour by a north wind;" confident, in the then imperfect state of the art of navigation, that, as the haven of Lemnos was situated to the north of Attica, they were perfectly secure from such an event. Miltiades, however, being possessed of the Chersonesus, easily sailed from a port in the Hellespont, and won the harbour of Lemnos, driven thither by a strong north wind; when, aware alike of the oracle and of the positive answer of the Lemnites, he instantly demanded a fulfilment of both, in their submission to him on the part of the Athenians. This requisition was immediately complied with, partly, perhaps, through their superstitious reverence of the oracle and partly in deference to their own honour.

But neither these services, nor the known friendship of Miltiades to the Athenian state, could screen him from censure, on account of that which was, in the eyes of the Athenians, a serious crime. He had, from an Athenian citizen, become a monarch; and, in their inveterate hatred to kingly government, they formed an accusation against him on this account, and he was regularly tried for the offence, of which however he was as strangely acquitted. His talents, reputation, and riches, now soon elevated him to the highest offices of public trust and honour; when the ambassadors of Darius came to Athens, demanding earth and water from the citizens, in token of their submission to the Persians. To the eloquence and exertions of Miltiades, Athens owed the glory of her decisive conduct. He induced his countrymen to throw those emissaries of the tyrant into a pit, as a signal of defiance to their master, proclaiming to them aloud, that in that place they would find the objects of their requisition, earth and water, sufficient for their purpose, and as much as the Athenian honour could grant them. After this hostile menace, when war was on both sides preparing with the utmost activity, Miltiades was appointed one of the ten generals to command the Athenian army, and he conducted the army to immortal honour in the field of Marathon, and saved Athens from being attacked and plundered by those fugitives whom he had already beaten. On his return to Athens from the splendid victory of Marathon, Miltiades was treated with increased respect. Soon afterwards, in an assembly of the people, he proposed that they should make a descent upon the island of Paros, to retaliate upon the inhabitants of that place for the offence which they had committed in rendering assistance to Darius, in his late expedition to Marathon.

Unfortunately, both for his own fate and the fortunes of the Athenians, Miltiades, now a leading man in their assemblies, succeeded without difficulty in persuading them to adopt his scheme; and they entrusted him with a fleet of seventy ships, well manned and proportionally appointed. With this force Miltiades sailed from Athens in high hopes of conquest, and promising to return with great riches and other advantages, the fruits of his anticipated victory. Arrived at the island of Paros, he landed without opposition, and sent heralds to the city demanding

the sum of one hundred talents to be immediately paid him as a ransom for their country, which, in case of refusal, he threatened to give up to the violence and plunder of his irritated army. The Parians, unmoved by these menaces, and confident of their own strength, refused even to deliberate on his proposals, sent back to Miltiades an unqualified defiance, and vigorously prepared for their defence. The Athenian army then invested the city, and for a time carried on the siege with considerable zeal and with some prospect of ultimate success, when an event befel their general which proved fatal to all their anticipations. Timo, a Parian priestess, came secretly to Miltiades, promising that she would disclose to him a method by which he might take the city with ease, and the Athenian general listened to her plan with eager credulity. In consequence of her advice he repaired in secret and alone to the temple of Ceres the law-giver, expecting to find its gates readily opened for his reception. In this he was disappointed, and by no violence was he able to force them. He therefore climbed to the top of the wall, and from thence leaped down into the area of the temple, still encouraging the hope that he should meet his supposed confederates. Finding in this place no one ready to assist him he now determined to attempt his return. With this view he hastily re-ascended the wall, when his foot slipped, and he broke his thigh in falling. In what manner he reached his camp we are not told, but his arrival might well be supposed to spread consternation and panic throughout the army; in consequence of it the siege was raised, and the expedition re-embarked, baffled and defeated in its purpose.

The short season of the glory of Miltiades, the victor of Marathon, had now passed away. The slightest misfortune was at all times sufficient to change the aspect of the Athenian favour; and in proportion as their expectations had been raised by success, so were their vexation and anger vented upon a reverse. With an army diminished in numbers and broken in spirit, the helpless Miltiades returned mortally wounded to Athens, and found that the general dissatisfaction was increasing. The circumstance of a personal quarrel with Lysagoras, the Parian chief, was alleged as an argument to prove his motive for the recent expedition to have been self-interest alone; and Xanthippus, the father of the famous Pericles, boldly came forward to the general assembly, and accused their formerly victorious and highly-favoured general of having designedly misled the people into the war. This construction of his conduct was instantly adopted, and the popular voice now loudly demanded the sentence of death on the unfortunate Miltiades, as an expiation of his crime. The situation of the accused was the more distressing, as it was utterly impossible, from his wounds, that he could appear and enter on his own defence. His known eloquence, and even his personal appearance, might not have been without their due influence on the multitude; but he was obliged, however unwilling, to trust his defence to Tisagoras, his brother, who, indeed, used his most strenuous and affectionate exertions on his behalf. Some writers, indeed, state that he was brought into the assembly on a couch, while his cause was pleaded by his friends. Tisagoras represented to the Athenians, that although Miltiades had failed in this last expedition, it was yet to him that they were indebted for that victory at Marathon, which had effected the preservation of Athens from

the cruelties threatened by the Persian monarch: he therefore entreated them to forgive his present error in consideration of his past services, and to regard, at least with commiseration, him to whom they were indebted for the power of that deliberation which they now exercised, and those laws which he had protected from dissolution by the Persian king. These arguments, and this joint appeal to their justice as well as to their pity, were not without their effect. On a solemn hearing the assembled Athenian people acquitted Miltiades of any crime deserving death, but at the same time they sentenced him to pay a fine of fifty talents, the amount of the late unfortunate Parian expedition. This was a payment too large for the fortune of Miltiades to sustain, and, maimed and disabled as he was, the Athenians dragged him to prison, condemning him to suffer in person for that which he was unable to pay in money; and this celebrated general died in prison from the mortification of his wounded limb soon after his trial and subsequent condemnation. The cruelty of the Athenians did not end with the death of their victim; they denied him the rites of burial until the fine imposed upon him was discharged; and Cimon, the son of Miltiades, offered his own person to redeem the body of his parent from further indignity.

MILTON, JOHN, the most distinguished of English poets, and one whose exertions in the cause of civil and religious liberty must ever entitle him to the grateful regards of his countrymen. He was born in Bread Street, December 9, 1608, and received his early education at St. Paul's school. Young Milton was removed at the age of seventeen to Christ's college, Cambridge, and soon distinguished himself by the purity and elegance of his Latin compositions as well as for his general classical attainments.

On leaving college he repaired to his father's residence in Buckinghamshire, where he spent five years in the most diligent study of the Greek and Latin classics; and during this interval he appears to have produced both his exquisite "Masque of Comus," which is stated in the title to have been performed at Ludlow Castle, in 1634, before the earl of Bridgewater, and some of the principal of his minor poems, of which we may especially notice his "Lycidas." The character of the poem is pastoral, it being as-

sumed that the author and his lamented friend, the hero of the poem, were brother shepherds:—

"For we were nurst upon the self-same hill;  
Fed the same flock by fountain, shade, and rill.  
Together both, ere the high lawns appear'd  
Under the opening eye-lids of the morn,  
We drove a-field, and both together heard  
What time the gray-fly winds her sultry horn,  
Batt'ning our flocks with the fresh dews of night  
Oft till the star that rose, at evening, bright,  
Toward Heav'n's descent had stop'd his west'ring wheel."

The complaint of the poet on the shortness of life and the reply of Phœbus to his lamentation, furnishes a beautiful specimen of this poem:—

"Fame is the spur that the clear spirit doth raise  
(That last infirmity of noble mind)  
To scorn delights, and live laborious days;  
But the fair guerdon when we hope to find,  
And think to burst out into sudden blaze,  
Comes the blind fury with th' abhorr'd shears,  
And slits the thin spun life. But not the praise,  
Phœbus replied, and touch'd my trembling ears;  
Fame is no plant that grows on mortal soil,  
Nor in the glist'ring foil  
Set off to the world, nor in broad rumour lies,  
But lives and spreads aloft by those pure eyes,  
And perfect witness of all-judging Jove;  
As he pronounces lastly on each deed,  
Of so much fame in heav'n expect thy meed.

Weep no more, woeful shepherds, weep no more,  
For Lycidas your sorrow is not dead,  
Sunk though he be beneath the wat'ry floor;  
So sinks the day-star in the ocean bed,  
And yet anon repairs his drooping head,  
And tricks his beams, and with new-spangled ore  
Flames in the forehead of the morning sky:  
So Lycidas sunk low, but mounted high,  
Through the dear might of him that walk'd the waves,  
Where other groves and other streams along,  
With nectar pure his oozy locks he laves,  
And hears the unexpressive nuptial song,  
In the blest kingdoms meek of joy and love.  
There entertain him all the saints above,  
In solemn troops and sweet societies,  
That sing, and singing in their glory move,  
And wipe the tears for ever from his eyes."

Dr. Johnson objects to Milton's "Lycidas," that "passion plucks no berries from the myrtle and ivy, nor calls upon Arethusa and Mincius, nor tells of rough satyrs and fauns with cloven heel." To which Warton very properly answers, "But poetry does this; and in the hands of Milton does it with a peculiar and irresistible charm. Subordinate poets exercise no invention when they tell how a shepherd has lost a companion, and must feed his flocks alone without any judge of his skill in piping; but Milton dignifies and adorns these common artificial incidents with unexpected touches of picturesque beauty, with the graces of sentiment and with the novelties of original genius."

But the sonnets of Milton have ever held a prominent place in his minor poems. We may take one on his blindness:—

"When I consider how my light is spent  
Ere half my days, in this dark world and wide,  
And that one talent which is death to hide,  
Lodg'd with me useless, though my soul more bent  
To serve therewith my Maker, and present  
My true account, lest he, returning, chide;  
Doth God exact day-labour, light denied?  
I fondly ask—but patience, to prevent  
That murmur, soon replies—God doth not need  
Either man's work or his own gifts; who best  
Bear his mild yoke, they serve him best; his state  
Is kingly, thousands at his bidding speed,  
And post o'er land and ocean without rest;  
They also serve who only stand and wait."

In 1638 Milton left England for the purpose of completing his education by foreign travel, and visited in succession Paris, Nice, Genoa, Pisa, Florence, Rome, and Naples. Honours from both the learned and the great waited upon the accomplished

Englishman wherever he appeared. The state of his native country, however, worn by dissensions, and manifestly on the eve of a great convulsion, appealed too strongly to his patriotic ardour to suffer him to protract his stay abroad; and returning by the way of Geneva he again reached home after an absence of about fifteen months. He did not now resume his residence with his father. He probably considered that for the unsettled times which were apparently at hand the fit preparation which it behoved every man to make was the adoption of some way of earning his bread by his own independent exertions; and hiring a house in St. Bride's church-yard, he opened a seminary for the instruction of youth in the classic languages. The school turning out very successful he shortly afterwards removed to a house in Aldersgate Street, and in 1641 he published a treatise in favour of the puritans.

In 1673 Milton married a daughter of Mr. Powell, of Forrest Hill, Oxfordshire, a firm royalist. This marriage in its early stage seemed very inauspicious, for, either influenced by family considerations, or from want of congeniality in sentiments and feelings, they had only been married a month when his wife deserted him and returned to her friends. She made no reply to the repeated letters and remonstrances of her husband, which so incensed him that he formed the resolution to receive her no more, and to justify this resolution he published several pieces on the subject of divorce. He even proceeded so far as to pay his addresses to a young lady with the design of marrying her. Whilst this marriage was negotiating he was surprised by a visit from his wife, who implored pardon and reconciliation on her knees. This awakened his tenderest affection, and he received her with kindness to his bosom. This interview, it is supposed, made so strong an impression on his imagination as to have contributed to his painting that pathetic scene in his "Paradise Lost," where he has thus beautifully described Adam's reconciliation to Eve, who,

"——— With tears that cease not flowing,  
And tresses all disordered at his feet,  
Fell humble, and embracing them, besought  
His peace, and thus proceeded in her plaint.  
Forsake me not thus, Adam! witness heav'n,  
What love sincere, and reverence in my heart,  
I bear thee, and unweeting have offended,  
Unhappily deceived! thy suppliant  
I beg and clasp thy knees: bereave me not,  
Whereon I live, thy gentle looks, thy aid,  
Thy council in this uttermost distress.  
My only strength and stay: forlorn of thee,  
Whither shall I betake me, where subsist?  
She ended weeping; and her lowly plight,  
Immoveable, till peace obtain'd from fault  
Acknowledg'd and deplor'd, in Adam wrought  
Commiseration: soon his heart relented  
Towards her, his life so late, and sole delight,  
Now at his feet submissive in distress;  
Creature so fair his reconciliation seeking,  
His counsel whom she had displeas'd, his aid:  
As one disarm'd, his anger all he lost."

Milton's political principles agreeing with the republican spirit of these times, he strongly supported the cause of the commonwealth and the destruction of kingly government by several publications on the subject.

In 1645 he published a collection of Latin and English poems. Soon after the death of the king he was advanced by Cromwell to the station of Latin secretary to himself and the parliament; and he continued to hold the latter office till the restoration of Charles II. In 1649 Salmasius, a professor of polite learning at Leyden, and a man of extraordinary literary attainments, produced his "Defensio Regis," to which

Milton replied in so forcible a manner that it became difficult to determine whose language was best. After this Milton resided for some time with his family in Whitehall; but his ill health obliged him to take lodgings in the neighbourhood of St. James's Park; where his wife died, leaving him three daughters. This painful occurrence was soon succeeded by another still more distressing—his own deprivation of sight. In these melancholy circumstances he directed his attention to another object, and was married to the daughter of a Captain Woodcock, of Hackney. She died within a year, from the same cause as the former wife. Milton has honoured her memory in his eighteenth sonnet.

On the king's restoration he found it necessary to conceal himself till the storm against him was blown over, and the interest of his friends had got him included in the general amnesty. He now retired from the busy scenes of the world, and devoted himself to the completion of his grand poem. For, although his circumstances had suffered by the restoration, his independent spirit refused to accept any public employment, and he lived in the greatest simplicity in the neighbourhood of Bunhill Fields, where we are told he used to sit in a gray coarse cloth coat at the door in the summer, to enjoy the fresh air and receive the visits of persons of distinguished rank and learning.

He had now reached his forty-seventh year, and being free from external interruptions, applied himself to the consideration of three works which had long been reserved for future exertion—an epic poem, the history of his country, and a dictionary of the Latin tongue. Impracticable as the labour of collecting a dictionary seems to be to a man in a state of blindness, we are told that he prosecuted that design almost to his dying day: the compilers of the "Cambridge Dictionary," published in 1693, availed themselves of three folios he left behind. His historical narrative did not proceed beyond the conquest, from the difficulty, it is probable, of consulting a variety of authorities with the help of other eyes. For the subject of his epic poem, after much deliberation, he determined upon "Paradise Lost;" a project which could only be justified by the success that attended it. We have already seen that at the restoration Milton concealed himself in Bartholomew Close, where he remained till the passing an act of oblivion, which secured his person and property in common with others: the reason of his being treated with such indulgence cannot be satisfactorily ascertained. About this time he removed to Jewin Street and married a third wife, who contributed very little to his domestic comfort:—she oppressed his children in his life-time and defrauded them at his death. From Jewin Street he went to reside in the Artillery Walk, near Bunhill Fields, which concludes the register of his London residences.

While he continued to divide his time between state affairs and his private studies, it was hardly possible for him to accomplish any literary undertaking of great importance; but on quitting the office of Latin secretary he was left to the free exercise of his mental energies, which could not be employed upon a subject better suited to the extensive range they were accustomed to take than that he had chosen. The "Paradise Lost" is said to have been written at different times, and was sold on the 27th of April, 1667, to Samuel Simmons for an immediate payment of

5*l.*; with a farther agreement for the same sum when 1500 copies of the first edition should be disposed of; and again 5*l.* when the same number should be sold of the second edition; and another 5*l.* after a similar sale of the third. All the editions were limited to 1500 copies. The third edition was published in 1678, and the widow, to whom the copy then devolved, sold all her claims to Simmons for 8*l.*: whence it will appear that the sum of 28*l.* constituted the entire remuneration for a performance which, while it immortalized the name of the poet, conferred an honour equally imperishable upon the nation signalised for his birth. While he was thus engaged he was materially assisted by his daughters, who wrote to his dictation for many hours each day, as represented in the subjoined sketch.

Four years after his "Paradise Lost" he published his "Paradise Regained," which was his favourite production—a preference which has ever been opposed to the opinion of the public. In the last year of his life he printed a collection of "Familiar Epistles" in Latin; to these (being too few to form a volume) he added some academical exercises.

In his last retreat he produced his "Samson Agonistes," a tragedy written on the Greek model. A life of indefatigable study, and which had been exposed to a variety of vicissitudes, now began to draw to a close. Milton had long been afflicted with the gout and other infirmities, and he died without a struggle on the 10th of November, 1674, in the sixty-sixth year of his age. His person was so delicate and beautiful in his youth, that at Cambridge he went by the appellation of "the Lady of Christ's College;" and in Italy the celebrated Giovanni Battista Manso, who had conferred considerable favours on him, gives a high idea of his beauty in a Latin epigram which has been thus translated:—

"So perfect thou in mind, in form, and face,  
Thou'rt not of English, but angelic race."

Campbell, the poet, a critic in every shape qualified to form an accurate opinion of the merits of Milton in regard to his powers of versification, furnishes the following remarks on the universality of his genius:—"In Milton," he says, "there may be traced obligations to several minor English poets; but his genius had too great a supremacy to belong to any school. Though he acknowledged a filial reverence for Spenser as a poet, he left no Gothic irregular tracery in the design of his own great work, but

gave a classical harmony of parts to its stupendous pile. It thus resembles a dome, the vastness of which is at first sight concealed by its symmetry, but which expands more and more to the eye while it is contemplated. His early poetry seems to have neither disturbed nor corrected the bad taste of his age. 'Comus' came into the world unacknowledged by its author, and 'Lycidas' appeared at first only with his initials. These and other exquisite pieces, composed in the happiest years of his life at his father's country house at Horton, were collectively published with his name affixed to them in 1645; but that precious volume which included 'L'Allegro' and 'Il Penseroso' did not, I believe, come to a second edition till it was republished by himself at the distance of twenty-eight years. Almost a century elapsed before his minor works obtained their proper fame.

"Even when 'Paradise Lost' appeared, though it was not neglected, it attracted no crowd of imitators, and made no visible change in the poetical practice of the age. He stood alone, and aloof above his times, the bard of immortal subjects, and as far as there is perpetuity in language, of immortal fame. The very choice of those subjects bespoke a contempt for any species of excellence that was attainable by other men. There is something that overawes the mind in conceiving his long deliberated selection of that theme—his attempting it when his eyes were shut upon the face of nature—his dependence, we might almost say, on supernatural inspiration, and in the calm air of strength with which he opens 'Paradise Lost,' beginning a mighty performance without the appearance of an effort.

"The warlike part of 'Paradise Lost' was inseparable from its subject. Whether it could have been differently managed is a problem which our reverence for Milton will scarcely permit us to state. I feel that reverence too strongly to suggest even the possibility that Milton could have improved his poem by having thrown his angelic warfare into more remote perspective; but it seems to me to be most sublime when it is least distinctly brought home to the imagination. What an awful effect has the dim and undefined conception of the conflict which we gather from the opening of the first book! There the veil of mystery is left undrawn between us and a subject which the powers of description were inadequate to exhibit. The ministers of divine vengeance and pursuit had been recalled—the thunders had ceased

\* To bellow through the vast and boundless deep.

(in that line what an image of sound and space is conveyed!)—and our terrific conception of the past is deepened by its indistinctness. In optics there are some phenomena which are beautifully deceptive at a certain distance, but which lose their illusive charm on the slightest approach to them, that changes the light and position in which they are viewed. Something like this takes place in the phenomena of fancy. The array of the fallen angels in hell—the unfurling of the standard of Satan—and the march of his troops

\* In perfect phalanx, to the Dorian mood  
Of flutes and soft recorders.—

All this human pomp and circumstance of war is magic and overwhelming illusion. The imagination is taken by surprise. But the noblest efforts of language are tried with very unequal effect to interest us in the immediate and close view of the battle itself

in the sixth book; and the martial demons, who charmed us in the shades of hell, lose some portion of their sublimity when their artillery is discharged in the daylight of heaven.

"If we call diction the garb of thought, Milton in his style may be said to wear the costume of sovereignty. The idioms even of foreign languages contributed to adorn it. He was the most learned of poets; yet his learning interferes not with his substantial English purity. His simplicity is unimpaired by glowing ornament, like the bush in the sacred flame, which burnt but 'was not consumed.'

"In delineating the blessed spirits Milton has exhausted all the conceivable variety that could be given to pictures of unshaded sanctity; but it is chiefly in those of the fallen angels that his excellence is conspicuous above every thing ancient or modern. Tasso had indeed portrayed an infernal council, and had given the hint to our poet of ascribing the origin of pagan worship to those reprobate spirits. But how poor and squalid in comparison of the Miltonic Pandæmonium are the Syllas, the Cyclopes, and the Chimeras of the Infernal Council of the Jerusalem! Tasso's conclave of fiends is a den of ugly incongruous monsters. The powers of Milton's hell are god-like shapes and forms. Their appearance dwarfs every other poetical conception when we turn our dilated eyes from contemplating them. It is not their external attributes alone which expand the imagination, but their souls, which are as colossal as their stature—their 'thoughts that wander through eternity'—the pride that burns amidst the ruins of their divine natures, and their genius that feels with the ardour and debates with the eloquence of heaven."

But the proudest monument that has been reared to the genius of Milton is the "Essay" from the pen of Dr. Channing. It breathes a spirit of poetry nearly akin to that with which that great poet was himself imbued, and furnishes the most masterly view of his genius that has yet appeared.

In speaking of the intellectual qualities of Milton, Dr. Channing says, "We may begin with observing, that the very splendour of his poetic fame has tended to obscure or conceal the extent of his mind, and the variety of its energies and attainments. To many he seems only a poet, when in truth he was a profound scholar, a man of vast compass of thought, imbued thoroughly with all ancient and modern learning, and able to master, to mould, to impregnate with his own intellectual power, his great and various acquisitions. He had not learned the superficial doctrine of a later day,—that poetry flourishes most in an uncultivated soil, and that imagination shapes its brightest visions from the mists of a superstitious age, and he had no dread of accumulating knowledge lest it should oppress and smother his genius. He was conscious of that within him which could quicken all knowledge, and wield it with ease and might; which could give freshness to old truths, and harmony to discordant thoughts; which could bind together by living ties and mysterious affinities the most remote discoveries; and rear fabrics of glory and beauty from the rude materials which other minds had collected. Milton had that universality which marks the highest order of intellect. Though accustomed almost from infancy to drink at the fountains of classical literature, he had nothing of the pedantry and fastidiousness which disdain all other draughts. His healthy mind delighted in genius, on

whatever soil, or in whatever age it burst forth and poured out its fulness. He understood too well the rights, and dignity, and pride of creative imagination, to lay on it the laws of the Greek or Roman school. Parnassus was not to him the only holy ground of genius. He felt that poetry was as a universal presence. Great minds were every where his kindred. He felt the enchantment of oriental fiction, surrendered himself to the strange creations of 'Arabian Nights,' and delighted still more in the romantic spirit of chivalry, and in the tales of wonder in which it was embodied. Accordingly his poetry reminds us of the ocean, which adds to its own boundlessness contributions from all regions under heaven. Nor was it only in the department of imagination that his acquisitions were vast. He travelled over the whole field of knowledge as far as it had then been explored. His various philological attainments were used to put him in possession of the wisdom stored in all countries where the intellect had been cultivated. The natural philosophy, metaphysics, ethics, history, theology, and political science of his own and former times, were familiar to him. Never was there a more unconfined mind, and we would cite Milton as a practical example of the benefits of that universal culture of intellect which forms one distinction of our times, but which some dread as unfriendly to original thought. Let such remember that mind is in its own nature diffusive. Its object is the universe, which is strictly one, or bound together by infinite connexions and correspondences; and accordingly its natural progress is from one to another field of thought; and wherever original power and creative genius exists, the mind, far from being distracted or oppressed by the variety of its acquisitions, will see more and more common bearings and hidden and beautiful analogies in all the objects of knowledge,—will see mutual light shed from truth to truth, and will compel, as with a kingly power, whatever it understands, to yield some tribute of proof, or illustration, or splendour, to whatever topic it would unfold.

"Milton's fame rests chiefly on his poetry, and to this we naturally give our first attention. By those who are accustomed to speak of poetry as light reading, Milton's eminence in this sphere may be considered only as giving him a high rank among the contributors to public amusement. Not so thought Milton. Of all God's gifts of intellect he esteemed poetical genius the most transcendent. He esteemed it in himself as a kind of inspiration, and wrote his great works with something of the conscious dignity of a prophet. We agree with Milton in his estimate of poetry. It seems to us the divinest of all arts; for it is the breathing or expression of that principle or sentiment which is the deepest and sublimest in human nature; we mean of that thirst or aspiration to which no mind is wholly a stranger, for something purer and lovelier, something more powerful, lofty and thrilling, than ordinary and real life affords. No doctrine is more common among Christians than that of man's immortality; but it is not so generally understood that the germs or principles of his whole future being are now wrapped up in his soul as the rudiments of the future plant in the seed. As a necessary result of this constitution, the soul, possessed and moved by these mighty though infant energies, is perpetually stretching beyond what is present and visible, struggling against the bounds of its earthly

prison-house, and seeking relief and joy in imaginings of unseen and ideal being. This view of our nature, which has never been fully developed, and which goes further towards explaining the contradictions of human life than all others, carries us to the very foundation and sources of poetry. He who cannot interpret, by his own consciousness, what we now have said, wants the true key to works of genius. He has not penetrated those sacred recesses of the soul, where poetry is born and nourished, and inhales immortal vigour, and wings herself for her heavenward flight. In an intellectual nature framed for progress and for higher modes of being, there must be creative energies, powers of original and ever-growing thought; and poetry is the form in which these energies are chiefly manifested. It is the glorious prerogative of this art, that it 'makes all things new' for the gratification of a divine instinct. It indeed finds its elements in what it actually sees and experiences in the worlds of matter and mind, but it combines and blends these into new forms and according to new affinities; breaks down, if we may so say, the distinctions and bounds of nature; imparts to material objects life, and sentiment, and emotion, and invests the mind with the powers and splendours of the outward creation; describes the surrounding universe in the colours which the passions throw over it, and depicts the mind in those modes of repose or agitation, of tenderness or sublime emotion, which manifest its thirst for a more powerful and joyful existence. To a man of a literal and prosaic character, the mind may seem lawless in these workings; but it observes higher laws than it transgresses, the laws of the immortal intellect; it is trying and developing its best faculties; and in the objects which it describes, or in the emotions which it awakens, anticipates those states of progressive power, splendour, beauty, and happiness for which it was created.

"We accordingly believe that poetry, far from injuring society, is one of the great instruments of its refinement and exaltation. It lifts the mind above ordinary life, gives it a respite from depressing cares, and awakens the consciousness of its affinity with what is pure and noble. In its legitimate and highest efforts it has the same tendency and aim with Christianity, that is, to spiritualize our nature. True, poetry has been made the instrument of vice, the pander of bad passions; but when genius thus stoops it dims its fires, and parts with much of its power; and even when poetry is enslaved to licentiousness or misanthropy, she cannot wholly forget her true vocation. Strains of pure feeling, touches of tenderness, images of innocent happiness, sympathies with suffering virtue, bursts of scorn or indignation at the hollowness of the world, passages true to our moral nature often escape in an immoral work, and show us how hard it is for a gifted spirit to divorce itself wholly from what is good. Poetry has a natural alliance with our best affections. It delights in the beauty and sublimity of the outward creation and of the soul. It indeed portrays with terrible energy the excesses of the passions; but they are passions which show a mighty nature, which are full of power, which command awe, and excite a deep though shuddering sympathy. Its great tendency and purpose is to carry the mind beyond and above the beaten, dusty, weary walks of ordinary life; to lift it into a purer element, and to breathe into it

more profound and generous emotion. It reveals to us the loveliness of nature, brings back the freshness of youthful feeling, revives the relish of simple pleasures, keeps unquenched the enthusiasm which warmed the spring-time of our being, refines youthful love, strengthens our interest in human nature by vivid delineations of its tenderest and loftiest feelings, spreads our sympathies over all classes of society, knits us by new ties with universal being, and through the brightness of its prophetic visions helps faith to lay hold on the future life.

"We are aware that it is objected to poetry, that it gives wrong views and excites false expectations of life, peoples the mind with shadows and illusions, and builds up imagination on the ruins of wisdom. That there is a wisdom against which poetry wars the wisdom of the senses, which makes physical comfort and gratification the supreme good, and wealth the chief interest of life, we do not deny; nor do we deem it the least service which poetry renders to mankind, that it redeems them from the thralldom of this earthborn prudence. But, passing over this topic, we would observe, that the complaint against poetry, as abounding in allusion and deception, is in the main groundless. In many poems there is more of truth than in many histories and philosophic theories. The fictions of genius are often the vehicles of the sublimest verities, and its flashes often open new regions of thought, and throw new light on the mysteries of our being. In poetry the letter is falsehood, but the spirit is often profoundest wisdom. And if truth thus dwells in the boldest fictions of the poet, much more may it be expected in his delineations of life; for the present life, which is the first stage of the immortal mind, abounds in the materials of poetry, and it is the high office of the bard to detect this divine element among the grosser labours and pleasures of our earthly being. The present life is not wholly prosaic, precise, tame, and finite. To the gifted eye, it abounds in the poetic. The affections, which spread beyond ourselves and stretch far into futurity; the workings of mighty passions, which seem to arm the soul with an almost superhuman energy; the innocent and irrepressible joy of infancy; the bloom, and buoyancy, and dazzling hopes, of youth; the throbbings of the heart, when it first wakes to love, and dreams of a happiness too vast for earth; woman, with her beauty, and grace, and gentleness, and fulness of feeling, and depth of affection, and her blushes of purity, and the tones and looks which only a mother's heart can inspire;—these are all poetical. It is not true that the poet paints a life which does not exist. He only extracts and concentrates, as it were, life's ethereal essence, arrests and condenses its volatile fragrance, brings together its scattered beauties, and prolongs its more refined but evanescent joys; and in this he does well; for it is good to feel that life is not wholly usurped by cares for subsistence and physical gratifications, but admits, in measures which may be indefinitely enlarged, sentiments and delights worthy of a higher being. This power of poetry to refine our views of life and happiness is more and more needed as society advances. It is needed to withstand the encroachments of heartless and artificial manners, which make civilization so tame and uninteresting. It is needed to counteract the tendency of physical science, which, being now sought, not as formerly for intellectual gratification, but for multi-

plying bodily comforts, requires a new developement of imaginative taste and poetry to preserve men from sinking into an earthly, material, epicurean life. Our remarks in vindication of poetry have extended beyond our original design. They have had a higher aim than to assert the dignity of Milton as a poet, and that is, to endear and recommend this divine art to all who reverence and would cultivate and refine their nature."

In delineating Milton's character as a poet, we are saved the necessity of looking far for its distinguishing attributes. His name is almost identified with sublimity. He is in truth the sublimest of men. He rises, not by effort or discipline, but by a native tendency and a godlike instinct, to the contemplation of objects of grandeur and awfulness. He always moves with a conscious energy. There is no subject so vast or terrific as to repel or intimidate him. The overpowering grandeur of a theme kindles and attracts him. He enters on the description of the infernal regions with a fearless tread, as if he felt within himself a power to erect the prison-house of fallen spirits, to encircle them with flames and horrors worthy of their crimes, to call forth from them shouts which should 'tear hell's concave,' and to embody in their chief an archangel's energies and a demon's pride and hate. Even the stupendous conception of Satan seems never to oppress his faculties. This character of power runs through all Milton's works. His descriptions of nature show a free and bold hand. He has no need of the minute graphic skill which we prize in Cowper or Crabbe. With a few strong or delicate touches he impresses, as it were, his own mind on the scenes which he would describe, and kindles the imagination of the gifted reader to clothe them with the same radiant hues under which they appeared to his own.

This attribute of power is universally felt to characterize Milton. His sublimity is in every man's mouth. It is felt that his poetry breathes a sensibility and tenderness hardly surpassed by its sublimity. We apprehend that the grandeur of Milton's

mind has thrown some shade over his milder beauties; and this it has done, not only by being more striking and imposing, but by the tendency of vast mental energy to give a certain calmness to the expression of tenderness and deep feeling. A great mind is the master of its own enthusiasm, and does not often break out into those tumults which pass with many for the signs of profound emotion. Its sensibility, though more intense and enduring, is more self-possessed, and less perturbed, than that of other men, and is therefore less observed and felt, except by those who understand, through their own consciousness, the workings and utterance of genuine feeling. We might quote pages in illustration of the qualities here ascribed to Milton. Turn to *Comus*, one of his earliest productions. What sensibility breathes in the descriptions of the benighted lady's singing by *Comus* and the Spirit!

"*Comus*. Can any mortal mixture of earth's mould  
Breathe such divine enchanting ravishment?  
Sure something holy lodges in that breast,  
And with these raptures moves the vocal air  
To testify his hidden residence:  
How sweetly did they float upon the wings  
Of silence, through the empty-vaulted night,  
At every fall smoothing the raven down  
Of darkness till it smiled! I have oft heard  
My mother Circe with the Sirens three,  
Amidst the flow'ry-kirtled Naiades,  
Culling their potent herbs and baleful drugs,  
Who, as they sung, would take the prison'd soul,  
And lap it in Elysium; Scylla wept,  
And chid her barking waves into attention,  
And fell Charybdis murmur'd soft applause:  
Yet they in pleasing slumber lull'd the sense,  
And in sweet madness robb'd it of itself;  
But such a sacred and home-felt delight,  
Such sober certainty of waking bliss,  
I never heard till now.

"*Spirit*. At last a soft and solemn-breathing sound  
Rose like a stream of rich distill'd perfumes,  
And stole upon the air, that even Silence  
Was took ere she was 'ware, and wish'd she might  
Deny her nature, and be never more;  
Still to be so displaced. I was all ear,  
And took in strains that might create a soul  
Under the ribs of death."

In illustration of Milton's tenderness, we will open almost at a venture.

"Now morn, her rosy steps in th' eastern clime  
Advancing, sow'd the earth with orient pearl,  
When Adam waked, so 'custom'd, for his sleep  
Was airy-light, from pure digestion bred,  
And temperate vapours bland, which th' only sound  
Of leaves and fuming rills, Aurora's fan,  
Lightly dispersed, and the shrill matin song  
Of birds on every bough: so much the more  
His wonder was to find unawaken'd Eve  
With tresses discomposed, and glowing cheek,  
As through unquiet rest: he on his side  
Leaning half-raised, with looks of cordial love  
Hung over her enamour'd, and beheld  
Beauty, which, whether waking or asleep,  
Shot forth peculiar graces; then with voice  
Mild, as when Zephyrus on Flora breathes,  
Her hand soft touching, whisper'd thus: awake,  
My fairest, my espoused, my latest found,  
Heav'n's last best gift, my ever new delight,  
Awake: the morning shines, and the fresh field  
Calls us; we lose the prime, to mark how spring  
Our tender plants, how blows the citron grove,  
What drops the myrrh, and what the balmy reed,  
How nature paints her colours, how the bee  
Sits on the bloom extracting liquid sweet.

"So cheer'd he his fair spouse, and she was cheer'd,  
But silently a gentle tear let fall  
From either eye, and wiped them with her hair;  
Two other precious drops that ready stood,  
Each in their crystal sluice, he ere they fell  
Kiss'd, as the gracious signs of sweet remorse  
And pious awe, that fear'd to have offended."

From this very imperfect view of the qualities of Milton's poetry, we hasten to his great work, '*Paradise Lost*,' perhaps the noblest monument of human

genius. The two first books, by universal consent, stand pre-eminent in sublimity. Hell and hell's king have a terrible harmony, and dilate into new grandeur and awfulness the longer we contemplate them. From one element, 'solid and liquid fire,' the poet has framed a world of horror and suffering, such as imagination had never traversed. But fiercer flames than those which encompass Satan burn in his own soul. Revenge, exasperated pride, consuming wrath, ambition though fallen, yet unconquered by the thunders of the Omnipotent, and grasping still at the empire of the universe,—these form a picture more sublime and terrible than hell. Hell yields to the spirit which it imprisons. The intensity of its fires reveals the intenser passions and more vehement will of Satan; and the ruined archangel gathers into himself the sublimity of the scene which surrounds him. This forms the tremendous interest of these wonderful books. We see mind triumphant over the most terrible powers of nature. We see unutterable agony subdued by energy of soul. We have not indeed in Satan those bursts of passion, which rive the soul as well as shatter the outward frame of Lear, but we have a depth of passion which only an archangel could manifest. The all-enduring, all-defying pride of Satan, assuming so majestically hell's burning throne, and coveting the diadem, which scorches his thunder-blasted brow, is a creation requiring in its author almost the spiritual energy with which he invests the fallen seraph. Some have doubted whether the moral effect of such delineations of the storms and terrible workings of the soul is good; whether the interest felt in a spirit so transcendently evil as Satan favours our sympathies with virtue. But our interest fastens, in this and like cases, on what is not evil. We gaze on Satan with an awe not unmixed with mysterious pleasure, as on a miraculous manifestation of the power of mind. What chains us, as with a resistless spell, in such a character, is spiritual might made visible by the racking pains which it overpowers. There is something kindling and ennobling in the consciousness, however awakened, of the energy which resides in mind; and many a virtuous man has borrowed new strength from the force, constancy, and dauntless courage, of evil agents.

Milton's description of Satan attests in various ways the power of his genius. Critics have often observed, that the great difficulty of his work was to reconcile the spiritual properties of his supernatural beings with the human modes of existence, which he was obliged to ascribe to them; and the difficulty is too great for any genius wholly to overcome, and we must acknowledge that our enthusiasm is in some parts of the poem checked by a feeling of incongruity between the spiritual agent and his sphere and mode of agency. But we are visited with no such chilling doubts and misgivings in the description of Satan in hell. Imagination has here achieved its highest triumph, in imparting a character of reality and truth to its most daring creations. That world of horrors, though material, is yet so remote from our ordinary nature that a spiritual being, exiled from heaven, finds there an appropriate home. There is, too, an indefiniteness in the description of Satan's person which incites without shocking the imagination, and aids us to combine in our conception of him the massiness of a real form with the vagueness of spiritual existence. To the production of this

effect much depends on the first impression given by the poet; for this is apt to follow us through the whole work; and here we think Milton eminently successful. The first glimpse of Satan is given us in the following lines, which, whilst too indefinite to provoke the scrutiny of the reason, fill the imagination of the reader with a form which can hardly be effaced:—

"Thus Satan, talking to his nearest mate  
With head up-lift above the wave, and eyes  
That sparkling blazed, his other parts besides  
Prone on the flood, extending long and large,  
Lay floating many a rood,

"Forthwith upright he rears from off the pool  
His mighty stature; on each hand the flames,  
Driven backward, slope their pointing spires, and roll'd  
In billows, leave 'th' midst a horrid vale."

We have more which we should gladly say of the delineation of Satan, especially of the glimpses which are now and then given of his deep anguish and despair, and of the touches of better feelings which are skilfully thrown into the dark picture, both suited and designed to blend with our admiration, dread, and abhorrence, a measure of that sympathy and interest with which every living thinking being ought to be regarded, and without which all other feelings tend to sin and pain. But there is another topic which we cannot leave untouched. From hell we flee to paradise, a region as lovely as hell is terrible, and which, to those who do not know the universality of true genius, will appear doubly wonderful when considered as the creation of the same mind which had painted the infernal world.

Paradise and its inhabitants are in sweet accordance, and together form a scene of tranquil bliss, which calms and soothes, whilst it delights the imagination. Adam and Eve, just moulded by the hand, and quickened by the breath, of God, reflect in their countenances and forms, as well as minds, the intelligence, benignity, and happiness of their author. Their new existence has the freshness and peacefulness of the dewy morning. Their souls, unsated and untainted, find an innocent joy in the youthful creation, which spreads and smiles around them. Their mutual love is deep, for it is the love of young, unworn, unexhausted hearts, which meet in each other the only human objects on whom to pour forth their fulness of affection; and still it is serene, for it is the love of happy beings who know not suffering even by name, whose innocence excludes not only the tumults but the thought of jealousy and shame, who, 'imparadised in one another's arms,' scarce dream of futurity, so blessed is their present being. We will not say that we envy our first parents; for we feel that there may be higher happiness than theirs, a happiness won through struggle with inward and outward foes, the happiness of power and moral victory, the happiness of disinterested sacrifices and wide-spread love, the happiness of boundless hope, and of 'thoughts which wander through eternity.' Still there are times, when the spirit, oppressed with pain, worn with toil, tired of tumult, sick at the sight of guilt, wounded in its love, baffled in its hope, and trembling in its faith, almost longs for the 'wings of a dove, that it might fly away' and take refuge amidst the 'shady bowers,' the 'vernal airs,' the 'roses without thorns,' the quiet, the beauty, the loveliness, of Eden. It is the contrast of this deep peace of paradise with the storms of life, which gives to the fourth and fifth books of this poem a

charm so irresistible that not a few would sooner relinquish the two first books, with all their sublimity, than part with these. It has sometimes been said that the English language has no good pastoral poetry. We would ask, in what age or country has the pastoral reed breathed such sweet strains as are borne to us on 'the odoriferous wings of gentle gales' from Milton's Paradise?

We should not fulfil our duty were we not to say one word on what has been justly celebrated, the harmony of Milton's versification. His numbers have the prime charm of expressiveness. They vary with, and answer to, the depth, or tenderness, or sublimity, of his conceptions, and hold intimate alliance with the soul. Like Michael Angelo, in whose hands the marble was said to be flexible, he bends our language, which foreigners reproach with hardness, into whatever forms the subject demands. All the treasures of sweet and solemn sounds are at his command. Words, harsh and discordant in the writings of less gifted men, flow through his poetry in a full stream of harmony. This power over language is not to be ascribed to Milton's musical ear. It belongs to the soul. It is a gift or exercise of genius, which has power to impress itself on whatever it touches, and finds or frames in sounds, motions, and material forms, correspondences and harmonies with its own fervid thoughts and feelings.

We close our remarks on Milton's poetry with observing, that it is characterized by seriousness. Great and various as are its merits, it does not discover all the variety of genius, which we find in Shakspeare, whose imagination revelled equally in regions of mirth, beauty, and terror, now evoking spectres, now sporting with fairies, and now 'ascending the highest heaven of invention.' Milton was cast on times too solemn and eventful, was called to take part in transactions too perilous, and had too perpetual need of the presence of high thoughts and motives, to indulge himself in light and gay creations, even had his genius been more flexible and sportive. But Milton's poetry, though habitually serious, is always healthful, and bright, and vigorous. It has no gloom. He took no pleasure in drawing dark pictures of life; for he knew by experience that there is a power in the soul to transmute calamity into an occasion and nutriment of moral

power and triumphant virtue. We find no where in his writings that whining sensibility and exaggeration of morbid feeling, which makes so much of

modern poetry effeminating. If he is not gay, he is not spirit-broken. His 'L'Allegro' proves that he understood thoroughly the bright and joyous aspects of nature; and in his 'Penseroso,' where he was tempted to accumulate images of gloom, we learn that the saddest views which he took of creation are such as inspire only pensive musing or lofty contemplation.

We must not omit to notice, in closing this article, that Milton left a posthumous work on "The Christian Doctrine," which was found in the State Paper Office a few years back. It did not appear in print till 1825, when it was edited and translated by Dr. Sumner. We have placed in the preceding page a sketch of the simple rustic edifice at Chalfont in Buckinghamshire, where Milton resided, and in which he completed his "Paradise Lost."

MINGOTTI, CATHARINE, an eminent singer, who was born at Naples in 1728, of German parents, and after the death of her father, who was in the Austrian military service, she entered an Ursuline convent. The music made such an impression upon her that she implored the abbess with tears to allow her to receive musical instruction, that she might be able to accompany the choir: her request was granted. At the age of fourteen she returned to her mother, and some years after married Mingoti, a Venetian, who had the direction of the opera at Dresden. On her first appearance at Dresden she attracted general admiration, and Porpora, who was then in the king's employ, procured her an engagement at the theatre. Her reputation soon extended through Europe, and she was engaged to sing at the grand opera in Naples, where she was received with undivided applause. On her return to Dresden in 1748, Hasse was at the head of the chapel, and endeavoured to place difficulties in her way, which she escaped with such success as to silence her enemies, and even Faustina. In 1751 she went to Spain under the direction of Farinelli, visited Paris and London in 1754, and afterwards the different cities of Italy, but always considered Dresden as her home during the life of Augustus. After his death she resided at Munich. She died in 1807. Mingotti spoke German, French, and Italian, with elegance, Spanish and English with ease, and understood Latin. Her style of singing was grand and dramatic, and such as discovered her to be a perfect mistress of her art. She was a judicious actress, her intelligence extending to the poetry, decorations, and every part of the drama.

MINOS, a king of the island of Crete, who lived about 1406 B. C., and is not to be confounded with his grandson of the same name. He is celebrated as a wise lawgiver, and for his strict love of justice. To make the Cretans formidable and powerful by union and military spirit, he obliged them often to at in common, and constantly exercised them in military duties.

MINOT, GEORGE RICHARD, an American historian, who was born at Boston in December 1758, and completed his studies at Harvard college. He embraced the profession of the law, which he practised with much credit. In 1792 he was appointed judge of probate for the county of Suffolk, Massachusetts. Judge Minot cultivated successfully both literature and science. He was one of the founders of the Massachusetts historical society. He published a very interesting narrative of the insurrection in Massachusetts in 1785, and various orations which

he pronounced in public; but his chief production is a valuable continuation of "Hutchinson's History of Massachusetts." He died in January 1802.

MINUCIUS, FELIX MARCUS, a native of Africa, who, about the close of the second and the commencement of the third centuries of the Christian era, attained to a considerable degree of reputation at Rome as a rhetorician. He was a Christian, and wrote a dialogue in defence of his religion, entitled "Octavius," of which Jerome and Lactantius speak highly. This work, however, was long considered to be the composition of Arnobius, till in 1560 Baudouin restored it to its real author. Another treatise, "De Fato," has also been ascribed to him; but from the difference of style which it exhibits when compared with the other work, some doubts are entertained as to its authenticity. There are two English translations of the "Octavius."

MINUTOLI, HENRY, BARON MENU, was born at Geneva in 1772, and entered the Prussian military service. In 1820 he married the widow of Baron Von Watzdorf, and she accompanied him on his scientific expedition to Egypt, made under the royal patronage. The travellers arrived at Alexandria, from whence the baroness went to Cairo while her husband visited Cyrene, determined the position of the oracle of Jupiter Ammon at Siwah, and, after returning to Cairo, visited Thebes. He returned in 1822. A part of his collections was lost by ship wreck, but the king of Prussia purchased the remainder for the new museum at Berlin. Among his works are, "Considerations on the Military Art," "On the Ancient Painting on Glass," "Journey to the Temple of Jupiter Ammon, in the Desert of Libya," and "Description of an old Heathen Burial Place, discovered at Stendal in 1826." The baroness has also published "Souvenirs d'Egypte."

MIRABEAU, HONORE GABRIEL, COUNT OF. —This distinguished Frenchman, who became so celebrated for his influence in the French revolution, was born in March 1749 at Bignon, in Provence. He sprang from a celebrated family. Education might have made him a truly great man, but the propensities of his genius were checked, and the development of his energies perverted. When fourteen years of age he entered a military boarding school, where he studied mathematics, made some progress in music and drawing, and became a proficient in bodily exercises. But as his moral education was entirely neglected, the most vehement passions grew with his growth. While yet a boy he published a eulogy on the great Condé, and some poems. On leaving school he entered the military service, and his intercourse with young and dissipated officers made him familiar with all their vices. His active mind, however, could not remain idle, and he read all the books which he could procure on the military art. He also fell in love, and his passion was marked by all the impetuosity of his character. His father, who systematically thwarted his inclinations, now procured his confinement in a fortress on the island of Ré, and was even on the point of having him sent to the Dutch colonies, but the friends of the family succeeded in preventing it. This abuse of the paternal power decided the son's hatred of despotism, and after his liberation he went as a volunteer to Corsica. He distinguished himself, and obtained a commission as captain of dragoons; but as his father refused to purchase him a regiment, he abandoned, though unwillingly, the mili-

tary profession. During the war in Corsica he wrote a memoir respecting it, with remarks on the abuses of the Genoese aristocracy, and gave it to his father, who destroyed it.

In conformity with the request of his father he now settled in Limousin, and employed himself in cultivating the earth, and in conducting lawsuits; but he soon became weary of his situation. His domestic circumstances, moreover, were unhappy. In 1772 he had received, in Aix, the hand of Mademoiselle de Marginane, an amiable young lady, with prospects of a large fortune. But his extravagant propensities soon involved him in a debt of 160,000 livres, and his contentious and inflexible father took advantage of the embarrassments of his son, and obtained from the Chatelet in Paris an interdict, by which he confined him to his estate. Here he published his "Essay on Despotism." He soon after left his place of confinement to avenge an insult offered to his sister, and a new *lettre de cachet* imprisoned him in 1774 in the castle of If, from whence he was transferred to Joux, near Pontarlier, in 1775. Here he first saw his Sophia, the wife of the president Monnier, a man of advanced age. His passion for her soon became extremely violent. In order to escape from the persecutions of this man and his father he fled to Dijon, whither his mistress followed. He was seized, and his father obtained new letters of arrest. Meanwhile M. de Malesherbes, who was then minister, and felt much good-will for the young Mirabeau, gave him a hint to escape from the country. He fled and took refuge in Holland with his mistress. The offended husband entered a complaint for seduction, and Mirabeau was condemned to death, and was decapitated in effigy. In Holland he went under the name of St. Matthew, and lived unnoticed; and during the years 1776 and 1777 he supported himself and his mistress altogether by his literary labours. Among other things, Mirabeau translated, in conjunction with Duvival, "Watson's History of Philippe II." Learning that his father accused him of the blackest offences, he avenged himself by sending abroad libels against him. His father now effected a violation of international law, and a police officer was sent to Holland with letters of arrest, signed by Amelot and Vergennes. Mirabeau and his mistress were arrested in 1777 without the consent of the Dutch governor. Mirabeau was incarcerated at Vincennes, but Sophia was conveyed to the convent of St. Clara at Gien. During an imprisonment of three years and a half at Vincennes, Mirabeau wrote the celebrated "Lettres à Sophie;" "Lettres Originales de Mirabeau;" and "Lettres écrites du Donjon de Vincennes." Their accent is passionate, and the style is various, flowing, and forcible.

Mirabeau's health was much affected by the confinement, and, under many bodily sufferings, he wrote, with the assistance of Calmet's "Dictionary of the Bible," his "Erotica-Biblion." At the same time he projected a grammar and a treatise on mythology, translated Johannes Secundus, and exposed the abuses of despotic authority in his energetic work on "Lettres de Cachet." As he was denied paper, he tore out the blank leaves in the beginning and end of the books allowed him. He concealed the leaves in the lining of his clothes, and left the prison with the manuscript of his "Lettres de Cachet" thus sewed in. His long incarceration had wearied his persecutors, and the judges also saw that the conduct of

Mirabeau's father, whose own character was far from moral, could only proceed from revenge and hatred. The son was therefore released in 1780, and seems to have become reconciled with his father, for he lived with him, and left the paternal mansion only to obtain the revocation of the sentence of death pronounced against him in Pontalier, in which he succeeded in 1782. At the same time Sophia recovered her dowry and freedom. Mirabeau now returned to Provence, and tried to effect a reconciliation with his wife; but nothing could overcome the opposition of his wife's relatives. He therefore had recourse to the law, and a process took place which was honourable to neither party, and which his wife gained. Mirabeau now came to London. His letters show that his opinions respecting England were not in general very favourable. He wrote here the "Considérations sur l'Ordre de Cincinnatus"—an order of which he disapproved, as the beginning of a military aristocracy in the United States. He likewise wrote against the plan of Joseph II. to make the Scheldt free, and against Linguet's celebrated work,—his "Doutes sur la Liberté de l'Escaut." He was also a coadjutor in the French journal, published in London, "Le Courrier de l'Europe." In his subsequent writings on the "Caisse d'Escompte," the "Banque de St. Charles," the "Actions des Eaux," he discussed the grounds of public credit, and of speculations in the public stocks, according to Adam Smith's principles, with much eloquence. This and the satirical portraits of well-known persons brought his works into repute. He nevertheless solicited in vain of the minister of finance, Calonne, the office of consul in Dantzic or Hamburg. He now lived some months of 1786 in Berlin, and then went to Brunswick, but returned to Berlin in the same year, probably with secret commissions from his court. In Berlin he collected information and projected the plan of the ingenious, but far from faultless work, "De la Monarchie Prussienne," which was executed by his friend Mauvillon. His description of Frederic II. is especially admired. In 1787 Mirabeau returned to France, and Calonne having convoked the notables, Mirabeau brought out his "Dénonciation de l'Agiotage, au Roi et aux Notables." The king, on account of the offensive character of this pamphlet, ordered the author to be imprisoned; but he escaped, and wrote a continuation of his "Dénonciation de l'Agiotage." He now wrote his "Avis aux Bataves." At that time there also appeared the letters on the Prussian court, written in confidence to Calonne, entitled "Histoire Secrète de la Cour de Berlin, ou Correspond. d'un Voyageur Français, depuis le 5 Juill. jusqu' au 19 Janv., 1787." This work was an indiscreet disclosure of his political manœuvres, and was written in the tone of a libel. It excited general reprehension of a man so unscrupulous as to make use of the secrets of hospitality, and the confidence of his friends and the government, an offering to the public appetite for scandal. The work was condemned by the parliament to be burnt by the common hangman.

When the estates were actually convoked he went to Provence for the purpose of being elected; but the noblesse of the province refused him a place among them, on the ground that none were entitled to it but the possessors of fiefs. He was now chosen by acclamation a deputy of the third estate, where he soon obtained an immense influence. The 23rd of

June was one of the most remarkable days of his political career, as it was decisive of the fate of the monarchy. The king, after making important concessions in this memorable sitting, had ordered the assembly to separate. The assembly however remained together in their seats. The marquis of Brezé, master of ceremonies, came to remind the assembly of the orders of the monarch. Mirabeau, in the name of his colleagues, made the celebrated answer, "The commons of France have resolved to deliberate. We have listened to the king's exposition of the views which have been suggested to him; and you, who have no claim to be his organ in this assembly,—you, who have here no place, nor vote, nor right of speaking,—you are not the person to remind us of his discourse. Go, tell your master that we are here by the order of the people, and that nothing shall drive us hence but the bayonet." Mirabeau had already made an unsuccessful attempt to establish an understanding with the ministers, with a view of relieving the distracted state of his pecuniary affairs. Negotiations were afterwards entered into between him and the court. He required a pension of 40,000 francs a week, and the promise of such a diplomatic or ministerial post as he should select, after the re-establishment of the royal authority. These demands were conceded, and he received the pension for several weeks. It was agreed that a dissolution of the assembly should be effected by an expression of the will of the nation, and that a new assembly should be convoked, composed of men of more moderate opinions. While the negotiations were pending, Mirabeau redoubled his activity in the assembly and at the Jacobin club. Suspicions were already entertained of his defection from the revolutionary party, and clamours had already been raised against him, when a fever closed his stormy life on the 2nd of April, 1791. The news of his decease was received with every mark of popular mourning: his funeral was solemnized with the utmost pomp. His body was deposited in the Pantheon, from which, however, in 1793, his remains were taken and dispersed by the populace, who then stigmatized him as a royalist. Mirabeau was the creature of his passions; the early restraints which had been imposed upon him served only to inflame them; and, with all the resources of genius, a decision and energy of will which yielded to no opposition, an audacity of purpose which shrunk before no difficulties, he united an insatiable ambition. His orations are collected in the book entitled "*Mirabeau peint par lui-même*," and in the "*Collection Compl. des Travaux de Mirabeau à l'Assemblée Nationale, par Méjan*," in "*Esprit de Mirabeau*," "*Lettres Inédites de Mirabeau, publ. par Vitry*," in his "*Œuvres Oratoires*," and "*Œuvres Choisies de Mirabeau*."

MIRANDA, DON FRANCISCO, the earliest martyr of freedom in Spanish America. He was born at Caracas of an ancient Spanish family. At the age of twenty he travelled through a great part of America on foot, and afterwards received the commission of colonel in the Spanish service. The governor of Guatemala employed him on several important occasions. In 1783 he visited the United States, and then travelled on foot through England, France, Italy, and Spain, against which he cherished the bitterest hatred. In 1789 he was at Petersburg, and Catharine endeavoured to engage him in her service; but the events in France drew him to Paris, where

he was employed on a mission to Pitt, and through Péthion's influence was appointed major-general. Under Dumouriez he was second in command in Champagne and Belgium, and his skill as an engineer and tactician, united with his uncommon talents, obtained for him the esteem of the republicans in Paris as well as the respect of the army. When Dumouriez entered Holland, Miranda was directed to besiege Maestricht, but, being unsupported by General Valence, was obliged to abandon the siege. In the battle of Neerwinden he commanded the left wing; Dumouriez imputed to him the loss of the battle, but the charge was refuted by Miranda in an able and ingenious defence. Dumouriez and Miranda had both declared against the Jacobins; but the former now became the object of suspicion to Miranda, who communicated his fears to his friend Péthion, then a member of the committee of public safety, and Miranda was ordered to arrest the commander. The Girondists, however, soon fell before the Mountain party, and Miranda was obliged to appear before the revolutionary tribunal. He was not convicted of the charges brought against him, and the fall of Robespierre delivered him from prison. Having, however, become suspected by the directory, he was again thrown into prison, and in 1797 was condemned to transportation, but fled to England. In 1803 he returned to Paris, and was again banished for taking part in an opposition to the first consul. General Miranda now devoted himself, with all the energy of his character, to the accomplishment of his long cherished scheme of overthrowing the Spanish dominion in America. Having procured some secret assistance, he sailed from New York in 1806 with one ship and a number of volunteers, and touched at St. Domingo, where he chartered two schooners. On arriving off the coast, the two latter were captured by Spanish *guardacostas*, and he was obliged to escape with his ship. In August he landed in Venezuela, but his attempts to rouse the inhabitants were altogether unsuccessful, and he found himself compelled to re-embark. In 1810 he renewed his attempt with more success, but was finally obliged to capitulate to the Spanish general Monteverde, who, in violation of the articles of his surrender, treated him as a prisoner. Miranda was sent to Spain, and confined in the dungeons of the inquisition at Cadiz, where he died after four years' imprisonment. Miranda was a man of great energy and sagacity, full of resources, bold, active, and intelligent.

MIRANDOLA, GIOVANNI PICO DELLA, count and prince of Concordia, surnamed the Phœnix, one of the brightest ornaments of literature at the time of the revival of letters. He was born in 1463, and was the youngest son of Gianfrancesco della Mirandola and Julia, of the noble family of Boiardo. His youth was marked by an early display of talent, and, being destined for the church, he was placed at Bologna to pursue the study of the canon law at the age of fourteen years. Two years were spent in this course, when his growing repugnance to the study, and his inclination to philosophical and scientific subjects, led him to visit the different parts of Italy and France for the purpose of observation, and to attend the most celebrated schools and most distinguished professors. After seven years of the most assiduous application he went to Rome, and in 1486 proposed 900 theses on all subjects, which he declared himself ready to defend, according to the

custom of the times, in public. He challenged all the learned from all countries to dispute with him, and offered to pay the expenses of the journey to those who came from a distance. No one ventured to appear against him, and the envious endeavoured to implicate him in a charge of heresy. Mirandola repelled the charge in his "Apologia," a work full of profound erudition. To deprive his enemies of every pretext for their accusations, he determined, although not insensible to pleasure, to lead the most rigid course of life, and to devote himself entirely to letters. In consequence of this resolution he threw into the fire five books of amatory poems in Italian, the loss of which is much to be regretted. None of his writings on this subject have been preserved, except a commentary on a canzone of Girolamo Benivieni, in which he follows the notions of the new Platonists in respect to love. Having next applied himself to the study of biblical literature, he published the fruits in his "Heptaplus," a mystical or cabalistic explanation of the history of the creation, in which he derives Plato's doctrines from Moses. Two years after he published a treatise, in ten chapters, "De Ente et Uno," in which he aimed to unite the opinions of Plato and Aristotle. Mirandola died at Florence in 1494, where he had lived some time in terms of intimacy with some of the most learned and distinguished men of the age, particularly Lorenzo de' Medici and Politian. At the time of his death he was employed in great literary enterprises, to which his treatise against astrology must be considered as preparatory. He was considered by his contemporaries a miracle of learning and genius. Paolo Giovio says that "the immortal gods had united in him all rare gifts of mind and body."

MIMNERMUS, the name of an ancient Greek poet and musician, known, according to Athenæus, as the inventor of the pentameter measure in versification. Strabo assigns Colophon as the city of his birth, which took place about six centuries before the commencement of the Christian era. Horace speaks in the highest terms of his love elegies, which he prefers to the writings of Callimachus, while Propertius places him before Homer in the expression of the softer passions. Both he and his mistress, Nanno, are said to have been musicians by profession, and to have been celebrated for their performance on the flute, especially, according to Plutarch, in a particular air, called Kradias, used at the Athenian sacrifices. A few fragments only of his lyric poems have come down to posterity, as preserved by Stobæus; they are, however, of a character which leads us to suppose that the high reputation he enjoyed was not unmerited. Nothing is known of the time or manner of his death.

MIRE, NOEL DE, an engraver of Rouen, among whose works are ornamental engravings accompanying the writings of Rousseau, Voltaire, Boccaccio, and Lafontaine. His last works form part of the beautiful Galerie de Florence. He died in 1801.

MIREVELT, MICHAEL JANSON, a portrait painter, born at Delft in 1568. He first intended to become an engraver under Wierinx, but at a later period studied the art of painting under a painter named Blocklandt. He is said to have painted 10,000 portraits and to have received a high price for them. Mirevelt was a Mennonite of a very amiable disposition. He died in his native city in 1641. His eldest son, Peter Mirevelt, is also esteemed as a painter.

MITAN, JAMES, a line engraver of considerable celebrity, who was born in London, February 13, 1776, and the rudiments of education were taught him by his father. In 1790 he was articled to Mr. Vincent, a writing engraver, but soon becoming tired of the monotony, and stimulated by the excellence of the productions of Mr. Sharp, who was a contemporary apprentice with Mr. Vincent as an heraldic engraver, he resolved to direct his efforts to the attainment of historical engraving, and was much indebted for instruction in drawing to Mr. Agar, then a pupil of Mr. Cheeseman's. Having entered himself as a student of the royal academy, Somerset House, he commenced copying the tickets of Bartolozzi, &c., which became a source of improvement to him as well as of emolument. His articles expiring in 1797, his time became principally devoted to the assistance of those who possessed either established reputation or extensive connexions: hence the prints that are known to be of his engraving are but few in comparison with the works of some modern engravers. In the year 1818 he applied himself to architectural design. His first production was a design for a chain-bridge over the Mersey, at Runcorn, eighteen feet in length, and drawn with elaborate minuteness. He next made a large design for a monument to commemorate the victory of Waterloo, that nearly employed his time for three months, during which he rose at three or four o'clock every morning. He also engraved many plates, after his own designs, for the admiralty. These exertions evidently endangered his health, which was much renovated by riding on horseback; but applying afterwards with his usual intensity, it brought on ultimately a paralytic affection that terminated his career. Mr. Mitan died August 16, 1822.

MITFORD, JOHN, a clever but imprudent writer for the press, who is believed to have been distantly related to the Redesdale family. He entered the navy, where he rose to the rank of lieutenant, and, after having fought under Hood and Nelson, retired on half-pay. He however became implicated in a disgraceful forgery of letters connected with the late Queen Caroline, for which he was degraded from his rank in the navy and also his station in society. From that period he supported himself entirely by his pen. He edited "The Scourge" and "The Bon Ton" magazines, both very discreditable periodicals. His principal poem was called "Johnny Newcome in the Navy." This was written when he had not a shelter for his head, and he died soon after in St. Giles's workhouse,—a melancholy example of perverted talents.

MITFORD, JOHN FREEMAN, a learned English statesman, who was born in August 1748, and educated at New college, Oxford. Having completed his studies, he entered Lincoln's Inn, and devoted himself to chancery practice, and rapidly rose to high rank in his profession. In 1799 he became attorney-general, and in 1802 was raised to the peerage and made lord chancellor, as well as a member of the privy council in Ireland. His lordship was a fellow of the royal and antiquarian societies, and died, much regretted, at his seat at Batsford Park, Gloucestershire, on the 17th of January, 1830. He was the author of a treatise entitled "Objections to the Project of Creating a Vice Chancellor of England," and other works of a similar character.

MITFORD, WILLIAM, a miscellaneous writer, who was born in London in 1743, and educated at

Queen's college, Oxford. Mr. Mitford's first publication appeared anonymously in 1774. It was "An Essay on the Harmony of Language, intended principally to illustrate that of the English Language." It was much admired, and Horne Tooke is stated to have frequently expressed a wish that he had been its author. The first volume of his "History of Greece" appeared in 1784. The favourable manner in which it was received encouraged him to proceed, and the second volume was published in 1790, the third in 1797, but the work was not completed till 1810. Whilst serving in the militia, Mr. Mitford published "A Treatise on the Military Force, and particularly the Militia of this Kingdom;" and in 1791, when the public mind was agitated on the great national question relative to the means of supplying the country with bread, he published another pamphlet, entitled "Considerations on the Opinion stated by the Lords of the Committee on Corn, in a representation to the King upon the Corn Laws, that Great Britain is unable to produce corn sufficient for its own consumption," &c.

Mr. Mitford first sat in the house of commons as member for Newport in Cornwall. He was returned in 1785 to fill the vacancy occasioned by the death of Sir John Coghill, Bart., and represented that borough till the close of the parliament in 1790. From 1790 to 1796 he was not a member of the house; but in 1796, through the interest of the duke of Northumberland, he was returned to the house of commons as member for Beeralston, of which borough his brother, Lord Redesdale, had been one of the representatives during the two preceding parliaments. He did not deliver his sentiments in the house on many subjects, but he gained great credit by his exertions in upholding the militia system. On the proposition brought forward in 1798 by Mr. Secretary Dundas (the late Viscount Melville), for increasing the number of field-officers in the militia, Mr. Mitford opposed the measure in its various stages, contending that the militia should be governed by the militia laws, and not by those of the regular army; and entered into a brief history of the militia of this country, commenting on the salutary jealousy of a military despotism with which it was established. On subsequent occasions Mr. Mitford always arrayed himself against any innovation of those principles on which the militia was originally founded. He sat in three parliaments for Beeralston, from 1796 to 1806, and afterwards represented New Romney from 1812 till 1813.

In 1802 Mr. Mitford acquired a large addition to his property in the Revelly estates, in Yorkshire, belonging to his mother's family. He continued however to his death to make Exbury, in Hampshire, his country residence, having only a year or two previously to the date last mentioned, rebuilt his paternal mansion there. It is situated on the shore between Lymington and Southampton, nearly opposite Yarmouth, in the Isle of Wight. The beauties of the place have been illustrated by the pen and pencil of the picturesque Gilpin. Mr. Mitford died at an advanced age in 1827.

MITHRIDATES, a celebrated Greek leader, who not only defeated Nicomedes, but also Aquilius, conquered Bithynia, and captured a great part of the Roman fleet. Phrygia, Caria, Mysia, Lycia, Pamphylia, Paphlagonia, and all the country as far as Ionia, fell into his hands and hailed him as the sa-

viour of Asia. The Roman generals Oppius and Aquilius were also given up to him as prisoners by the inhabitants of Laodicea and Lesbos; and he caused melted gold to be poured down the throat of the latter, in derision of the avarice of the Romans. The free cities of Asia, Magnesia, Mitylene, Ephesus, &c., opened their gates to the victor, who collected treasure sufficient to maintain his army five years. He caused all the Roman citizens in Asia Minor, with their wives and children, to be put to death. Dionysius and Plutarch give the number of those who perished at 150,000; Appian at 80,000.

Mithridates next conquered the islands of the Aegean Sea. Rhodes, however, held out so firmly that he returned to Pergamus. From hence he sent his general Archelaus with 120,000 men to Greece. Athens fell by treachery into his hands, and various other places were taken, while another of his generals, Metrophanes, ravaged Eubœa. On the news of the defeat of the latter, Mithridates sent his son Ariarathes with a powerful army into Macedonia, which, with Thrace, was speedily conquered. His arms were every where victorious, until at length the report that he threatened Italy itself led the Romans to adopt more decisive measures. Sylla embarked for Greece, reduced Athens by famine, destroyed the army of Archelaus in a bloody contest at Chæronea, and emancipated all Greece by two victories in Bœotia. Fimbria, with no less success, reduced Asia Minor, and besieged Mithridates himself in the fortress of Pitane, who finally fled to his ships. The Pontic fleet was also twice defeated by Lucullus. Thus pressed on every side, Mithridates commissioned Archelaus to conclude a treaty, which Sylla granted under severe conditions, B. C. 89. Mithridates was limited to his hereditary kingdom of Pontus, and compelled to deliver into the hands of the Romans eighty ships of war manned, and to pay 2000 talents. Sylla had scarcely left Asia before Mithridates attacked Colchia, and refused to fulfil the conditions of the peace. The Roman general, Murena, who entered and ravaged Pontus, was defeated, and many cities of Asia had declared themselves for the victor, when Aulus Gabinius, sent by the dictator Sylla, appeared. Cappadocia was evacuated by Mithridates; but, on the other hand, he subdued the Bosphorians, and had no sooner heard of the death of Sylla than he determined to recover the countries he had ceded, and, in order to distract the Romans, entered into a treaty with Sertorius, the chief of the Marian faction in Spain. His son-in-law Tigranes, king of Armenia, entered into his designs and marched to Cappadocia, while Mithridates himself, after the subjugation of Paphlagonia, conquered Bithynia and the provinces of Asia.

A new war with Rome was now unavoidable. The consuls Lucullus and Cotta went against Mithridates, the latter as commander of the fleet, and the former as general of the land forces. Cotta was unsuccessful; Lucullus, on the contrary, cautiously avoided a general engagement with the superior forces of the enemy, but at the same time gained so many important advantages by sea and land that he soon entered Pontus as a conqueror. While he was besieging Amisus, Mithridates collected an army and gained a decided victory; yet Lucullus succeeded in regaining what he lost, and Mithridates found himself compelled, by the revolt of his own troops, to fly to Tigranes, in Armenia, who received him, but did not

make common cause with him. Lucullus, who had in the mean time transformed Pontus into a Roman province, demanded the surrender of Mithridates, which Tigranes refused, because, as he said, although he disapproved the conduct of Mithridates, he nevertheless esteemed it dishonourable to deliver up so near a connexion to his enemies; but, as he foresaw that the Romans would not be contented with this answer, he agreed with Mithridates that he should return to Pontus with 10,000 men, collect an army, and return with it before Lucullus, who was besieging Sinope, should come into Armenia. Sinope, however, surrendered sooner than they expected, and Lucullus defeated Tigranes before his junction with Mithridates. Tigranes, nevertheless, collected a new army, which Mithridates led into Pontus. Lucullus, however, checked his progress by a victory; but during the winter Mithridates strengthened his forces, and soon entirely defeated the lieutenants of Lucullus, and then directed his march towards Armenia Minor, to form a junction with Tigranes. In the mean time the consul Manlius Acilius Glabrio had taken the chief command, in the place of Lucullus. The allied kings took advantage of the confusion incidental to this change, and re-conquered the greatest part of Pontus, Bithynia, Cappadocia, and Armenia Minor. Pompey then appeared at the head of the Roman army. After he had in vain offered him peace and sought a decisive battle, he besieged Mithridates in his camp, not far from the Euphrates. The king thence retreated, but was pursued, attacked in a defile, and totally routed at Nicopolis; he escaped with only 800 horse. Tigranes would not receive him, and he fled to Colchis. Pompey followed him, and he took refuge in the dominions of a Scythian prince. He was now thought to be dead until he suddenly re-appeared in Pontus, collected troops, and at the same time offered terms of peace to Pompey; they could not, however, agree, and the war broke out afresh. The force of the Romans in Pontus was small, and Mithridates made some progress. The inhabitants, however, soon revolted from him, and his neighbours refused him their assistance; nevertheless, his unbending spirit rejected the proposals of peace made by Pompey. He put to death his son Machares, made himself king in Bosphorus, and formed the bold project of penetrating into Gaul at the head of his army, and marching with the inhabitants into Italy; but having encamped at the Cimmerian Bosphorus, an insurrection broke out in his army, at the head of which was his son Pharnaces. Unable to reduce the rebels to their duty, and having taken poison without effect, Mithridates threw himself upon his sword that he might not fall alive into the hands of the Romans. This celebrated monarch ruled Pontus fifty-nine years.

**MOHAMMED.**—This celebrated eastern impostor began his pretended mission A. D. 609, in the fortieth year of his age. He first converted his wife Khadijah, to whom he communicated the particulars of an interview with the angel Gabriel, by whom he was declared an apostle of God. Through her instrumentality her uncle or cousin Waraka was gained, who is said to have been a Christian, and well acquainted with the Old and New Testaments. These were followed by Mohammed's servant, Zeid, to whom he gave his freedom, and by his young nephew, the fiery Ali. Of great importance was the accession of Abubeker, a man of estimable character, who stood

in high respect, and persuaded ten of the most considerable citizens of Mecca to follow his example. They were all instructed by Mohammed in the doctrines of the Islam, as the new religion was styled, which were promulgated as the gradual revelations of the divine will, through the angel Gabriel, and were collected in the Koran. Three years passed in the quiet dissemination of his doctrines: in the fourth, Mohammed invited his relatives of the family of Hashem to an entertainment, openly announced to them his prophetic mission, and asked which of them would undertake the office of his vizier. All were silent till the youthful Ali declared his readiness to do so, and, at the same time, his resolution to inflict vengeance on all who should dare to oppose his master. In vain did Abu Taleb, the father of Ali, dissuade them from the undertaking. But, although he remained himself unconverted, he did much to promote the new doctrines, by protecting Mohammed against his enemies and affording him refuge in times of danger. On several occasions Mohammed was attacked by the adherents of idolatry with open force, and compelled to change his residence; but he often had the satisfaction of converting his bitterest enemies. In the tenth year of his prophetic office he suffered a severe loss in the death of Abu Taleb and his faithful Khadijah. Deprived of their assistance, he was compelled to retire, for a time, to the city of Tayef. On the other hand, he was readily received by the pilgrims who visited the kaaba, and gained numerous adherents among the families in the neighbourhood.

At this time occurred Mohammed's celebrated nocturnal journey to heaven on the beast Alborak, under Gabriel's guidance, respecting which the Koran contains some obscure intimations. In the twelfth year the Islam was also spread among the inhabitants of Medina, several of whom swore fidelity to the prophet, and proffered their assistance. Mohammed now adopted the resolution of encountering his enemies with force. Only the more exasperated at this, they formed a conspiracy to murder him: but, warned of the imminent danger, he left Mecca, accompanied by Abubeker alone, and concealed himself in a cave not far distant. Here he spent three days undiscovered, after which he arrived safely at Medina, but not without danger. This event, from which the Mohammedans commence their era, is known under the name of the Hegira, which signifies flight. In Medina, Mohammed met with the most honourable reception: thither he was followed by many of his adherents, and he then assumed the sacerdotal and regal dignity, married Ayesha, daughter of Abubeker, and, as the number of the faithful continued to increase, declared his resolution to propagate his doctrines with the sword. The hopes of booty added new fervour to the religious zeal of his partisans. Their first great military exploit was the spoiling of a rich caravan, led by Abu Sophian, the chief of the Koreishites, with a strong guard. Mohammed surprised them, with an inferior force, in the valley of Beder, and inflicted on them a total defeat. He took a rich booty, and a number of prisoners. Other successful enterprises followed; but, in the third year of the Hegira, Abu Sophian, with 3000 soldiers, attacked Mohammed with 950 on Mount Ohud, not far from Medina, and a desperate conflict ensued, in which the Moslems were utterly beaten, and the wounded prophet with difficulty saved his life. This

misfortune naturally shook the authority of him whose pretended mission from God should have secured him the victory. But by attributing the fault to the sins of the Moslems, by promising the slain a paradise provided with all sensual enjoyments, and inculcating an unconditional predestination, he succeeded in restoring his tottering credit.

Good need had he of it in the following year, when Abu Sophian appeared before Medina with 10,000 men. Mohammed prudently limited himself to the defensive; but the enemy raising the siege, after twenty days, on account of internal discord, Mohammed, under the pretence of a divine command, led his party against the Jewish race of Koreidha, who had made common cause with the enemy. After twenty-five days the Jews were compelled to surrender their chief fortress to the will of the conqueror, who took the most bloody revenge, slaughtered between 600 and 700 men, and carried away the women and children into captivity. Some years afterwards he also took Khaibar, the principal seat of the Jewish power in Arabia, by which means he completed the subjugation of this unhappy people. It is probable that the many murders and cruelties practised on his enemies were sufficiently justified in the eyes of his followers by his divine mission; but they must have been highly offended by the violation of all right and decency of which he was guilty in his passion for Zeinab, the wife of his emancipated slave and adopted son Zeid, while a particular chapter was introduced into the Koran to give him power to marry her; this he did publicly, without regard to a degree of relationship which the Arabs had hitherto held inviolable. This weakness with respect to the female sex increased with the years and authority of Mohammed. Besides the numerous wives whom he took at different times, he indulged in several transient amours, such as are forbidden in his own laws, and always justified his incontinency by new chapters in the Koran. That such shameless pretences could have any effect rather proves the credulity and fanaticism of the people than his own talents of deception. At the same time his doctrines and authority gained ground among the neighbouring tribes. The expeditions of his officers rarely failed to produce a considerable booty, and he was himself almost worshipped by his partisans.

His views, meanwhile, continued to expand, and, in the seventh year of the Hegira he sent a summons to the principal neighbouring princes, particularly Chosrou Parviz, king of Persia, Heraclius, emperor of Constantinople, Mokawkas, ruler of Egypt, the king of Ethiopia, and the princes of various districts of Arabia, to embrace the new revelation of the divine law made through him. The manner in which this embassy was received differed according to the power and pride of those to whom it was directed. The more remote and powerful gave no heed to it: on the contrary, the weaker and nearer, who were informed of his increasing power, had cause to fear his arms. It was of particular importance to him no longer to be an exile from Mecca, the holy city, which was in a high degree the object of the adoration of the Arabs. He appeared, therefore, at the head of 1400 men, with the ostensible purpose of peaceably visiting the temple of Mecca. The Koreishites opposed his entrance, and compelled him to a treaty, in the seventh year of the Hegira. For three days only he and his partisans were to be allowed to

pay their devotions, unarmed, in the kaaba; on the fourth day he was to withdraw. He succeeded, however, on this occasion, in converting three persons of influence among the Koreishites, who had afterwards still greater renown among the Moslems, — Caled, Amru, and Othman. In the eighth year of the Hegira, a Mohammedan army, under Zeid's command, advanced against the city of Muta, in Palestine, where the governor of the emperor Heraclius had murdered a Moslem ambassador. Zeid was slain, and the defeat of the Moslems was prevented solely by the courage of Caled, who, on this occasion, obtained the appellation of "sword of God." A breach of compact on the part of the Koreishites gave Mohammed the desired opportunity to lead against Mecca 10,000 well-armed soldiers, inspired by pious zeal. The terrified Koreishites made little resistance, and received life and liberty only on condition that they embraced the Islam. The idols of the kaaba were demolished, but the sacred touch of the prophet made the black stone again the object of the deepest veneration. The temple became the principal sanctuary of the religion of Mohammed, and its professors alone are allowed access to the holy city of Mecca. This important event took place in the eighth year of the Hegira.

The destruction of some celebrated idols, and the subjugation of various Arab tribes, now employed the Moslem arms. In the valley of Honain, not far from Mecca, where Mohammed incurred great personal danger, he achieved the victory only by the utmost exertions. The following year the Mohammedans call the "year of embassies," because a number of Arab tribes announced by deputies their submission and conversion. At the head of 30,000 men, among whom were 10,000 cavalry, Mohammed was resolved to anticipate the hostile plans of the emperor Heraclius. He marched into Syria to Tabuk, halfway to Damascus, but returned to Medina, and contented himself with summoning the emperor in writing to embrace his doctrines. After his return he promulgated a new chapter of the Koran, revoked all regulations in favour of idolaters, and declared all the compacts concluded with them null. He might now be regarded as master of the whole of Arabia, although all the inhabitants had not yet received his religion, and he allowed the Christians a free exercise of their worship on the payment of a tribute. In the tenth year of the Hegira, Mohammed undertook his farewell pilgrimage to Mecca, and on this occasion he was surrounded with the utmost splendour, and attended by 90,000, or, as some say, 150,000 friends. This was the last important event of his life. He died soon after his return to Medina, in the arms of his wife Ayesha, in the eleventh year of the Hegira, in his sixty-third year. Of all his wives, the first alone bore him children, of whom only his daughter Fatima, wife of Ali, survived him.

The Mohammedan writers undoubtedly exaggerate the corporeal and mental endowments of their prophet; it is, however, very credible that there was a prepossessing majesty in his appearance, and that he united much natural eloquence with a decisive and enterprising mind. By these gifts he succeeded in exalting himself above his equals, and gaining confidence and popularity. Compared with his countrymen, he stands pre-eminent; compared with other legislators and monarchs, he holds but an inferior rank. Whether he himself believed what he pro-

mulgated as a divine revelation is a different question to answer. Most probably he ought to be regarded as a religious enthusiast, who deemed himself actually inspired by the Divinity, but was not so entirely blinded as to overlook the means of making his doctrines acceptable to the people and of confirming his dominion over their minds. Thence the fabrication of his interview with the angel Gabriel, thence his visionary journey through the seven heavens of paradise, thence his indulgence of the sensual desires of a sensual people. The first tenet of his creed was, "Allah alone is God, and Mohammed is his prophet." At the same time Moses and Christ were regarded in his system as divinely inspired teachers of former times, and he by no means denied the authenticity of the sacred histories and revelations of ancient Judaism and Christianity, which he only believed to be corrupted. The paradise which he promised to his faithful adherents was a heaven of sensual pleasure, he himself perhaps anticipated no other. His morality was compiled from the ancient Jewish and Christian systems. The faithful adoration of Allah as the only God, unwavering obedience to the commands of the prophet, the necessity of prayer, charity to the poor, purifications, abstinence from forbidden enjoyments (especially from strong drinks, this prohibition was caused by the quarrels that arose among his adherents), bravery, upholding even to death the cause of God and entire resignation to unavoidable fate, are the chief points of his moral system. Of solemnities, fasts, and usages such a religion for a sensual people could not be destitute; but the injunction of a pilgrimage to Mecca and Medina was unquestionably a political measure, in order to sanctify for ever the original seat of the Islam, and to secure permanently the political and religious importance of Arabia. These doctrines are contained in the Koran, to which was soon after added a second collection, Sunna. But all Mohammedans do not receive the latter; those who do are therefore called Sunnites.

One of the principal means of the rapid and extensive diffusion of his doctrines and dominion was force, all who did not submit of their own accord being compelled to do so at the edge of the sword. Rarely do we find in his history any traces of his having made use of women for promoting his plans, although he allowed polygamy with some restrictions, and concubinage without any bounds. That he persuaded his first wife that the attacks of epilepsy which he had were celestial trances, and that she first procured him adherents by the propagation of this fable, seems to be a tale devised by his Christian opponents to expose the prophet to contempt. Certain it is that he himself declared he did not work miracles. His disciples, nevertheless, ascribe to him the most absurd miracles; for example, that a part of the moon fell into his sleeves, and that he threw it back to the heavens, that stones, trees, and animals, proclaimed him aloud to be the prophet of God, &c., but of such fables we find abundance in the legends of the Christian saints. In a moral point of view he can never be compared with the divine founder of Christianity. The reverence which the faithful Moslems pay to the prophet, and all that is connected with him in the remotest degree, is as great as the reverence of relics has ever been in Christendom; thus, for example, the camel which carries the Koran to the kaaba, and in the territory of Mecca an enormous

BIOGRAPHY.—VOL. II.

number of doves, which must not even be scared from the fields, much less be killed, because they are thought to be descended from the dove that approached the ear of Mohammed, are objects of the most sacred reverence. But the wonder-loving populace alone gives credence to the fable that Mohammed's coffin is suspended in the air; on the contrary, he lies buried at Medina, where he died, and an urn enclosed in the holy chapel constitutes his sepulchre, which is surrounded with iron trellis work, and is accessible to no one. Mohammed's doctrines have given rise to many sects, among which the Sunnites and Shiites, the chief ones, still entertain the most violent mutual hatred among the Persians and Turks.

MOHAMMED II.—This Turkish emperor, surnamed Bujuk the Great, was born at Adrianople in 1430, and succeeded his father, Amurath II., in 1451. He renewed the peace made by his predecessor with the Greek emperor, but resolved to complete the conquest of the enfeebled Greek empire by the capture of Constantinople. On the 6th of April, 1453, therefore, Mohammed appeared before Constantinople, to which he laid siege with an army of 300,000 soldiers, and by water with 300 galleys and 200 small vessels. The besieged had drawn strong iron chains before the harbour; and made a brave resistance, though they had but about 10,000 men to oppose so great a force. But Mohammed having contrived to get a part of his fleet over land into the harbour, and caused a bridge of boats to be constructed and occupied with cannon, the Greeks were overcome after a defence of fifty-three days, and the empire came to its end. The city was taken by storm on the 29th of May, and abandoned to pillage. The emperor Constantine Palæologus fell at the commencement of the assault sword in hand, and in a few hours after the conquest of the city was completed the conquerors gave themselves up to every cruelty and excess. When Mohammed entered the city he found it desolate, but as he designed it for the principal seat of his empire, he strove to attract new inhabitants by promising the Greeks full religious liberty, and permitting them to choose a new patriarch whose dignity he himself increased, and Constantinople under him soon became again flourishing. He restored the fortifications, and for greater security caused the forts called the Dardanelles to be erected at the mouth of the Hellespont.

Mohammed pursued his conquests which were checked for a time by Scanderbeg, prince of Albania, who was favoured by the mountainous character of the country. The sultan finally concluded peace with him, but after Scanderbeg's death in 1466 soon subjugated all Albania. His further advances into Hungary were prevented by the celebrated John Hunniades, who obliged him in 1456 to raise the siege of Belgrade, in which he had lost 25,000 men, and had been himself severely wounded. The son of the great Hunniades, King Matthias Corvinus, also kept the Turks from Hungary, and even took from them Bosnia. On the other hand, Mohammed conquered in a short time Servia, Greece, and all Peloponnesus, most of the islands of the Archipelago, and the Greek empire of the Comneni established in the beginning of the thirteenth century at Trebisonde on the coast of Asia Minor. The Christian powers began to be apprehensive of the progress of his arms, and, at the instigation of Pope Pius II., in 1459 a crusade against the Turks was resolved upon at

2 B

Mantua, which was never, however, executed on account of the bad constitution of most of the European states. From the republic of Venice, Mohammed tore Negropont in 1470. He also stripped them of other possessions, and took Caffa from the Genoese in 1474. Frequent wars with the Persians prevented the further prosecution of his enterprises against the Christian powers, but in 1480 he attacked the island of Rhodes, where he was repulsed by the knights with great loss. He now turned his arms against Italy, took Otranto, and would probably have pursued his conquests in that country but for his death in 1491 while on an expedition against Persia. During his reign of thirty years he had conquered twelve kingdoms and upwards of 200 cities. On his tomb he ordered the words to be affixed, "I would have taken Rhodes and conquered Italy," probably as a stimulus to his successors. His character was distinguished by talents, ambition, courage, and fortune, and disgraced by cruelty, perfidiousness, sensuality, and contempt of all laws. He spoke Greek, Arabic, and Persian, understood Latin, drew and painted, had a knowledge of geography and mathematics, and of the history of the great men of antiquity. In short, he would have been a hero had not his cruelties blackened his reputation. Policy sometimes kept in check the impetuosity of his character, but he was too often the slave of his passions, though all the cruelties ascribed to him are not to be credited.

**MOHAMMED IV.**—This monarch was born in 1642, and was raised to the throne while a boy of seven years of age, his father, Ibrahim, having been murdered in an insurrection of the Janizaries. His grandmother, an ambitious woman, managed the government, but perished in a revolution of the seraglio, and the celebrated grand-vizier, Mohammed Kuperli, or Kuprili, was now placed at the head of the government. To this great minister, and to his equally great son and successor, the Turkish empire was indebted for the consequence which it maintained till the end of the seventeenth century. Mohammed was himself an insignificant personage, whose principal passion was the chase. Kuperli turned his chief attention to the restoration of the internal tranquillity of the empire, to which he sacrificed a great number of persons. The war begun in 1645 against the Venetians, mainly respecting the island of Candia, was therefore but weakly prosecuted; but in 1667 Achmet Kuperli, one of the greatest Turkish generals, undertook the celebrated siege of this island, which lasted two years and four months. The capitulation was signed on the 5th of September, 1669, at the same time with the terms of peace between Venice and the Turks. A war had already broken out with the emperor Leopold on account of Transylvania. The Turks had made considerable progress in Hungary, when they were totally defeated by Montecucoli at St. Gothard. Nevertheless, to the astonishment of all, the emperor accepted the disadvantageous truce of Temeswar, proffered by the Turks. Never had the Turks approached so near the boundaries of Germany as now. The anarchy which prevailed in Poland under King Michael, and the disturbances of the Cossacks, gave occasion in 1672 to a war of the Turks against Poland, which had to purchase peace on ignominious conditions. But the great Polish general, John Sobieski, revenged the ignominy of his nation by a decisive victory at Choczim in 1673, and in 1676 obtained from the Turks an honourable peace.

Sobieski also contributed most essentially to the relief of Vienna, which was besieged for more than six weeks by the grand vizier Kara Mustapha, with 200,000 men, in the war caused in 1683 by the Palatinate in Hungary. The Turks were attacked in their camp by the allied Christian army, and defeated with extraordinary loss. The grand vizier atoned for his ill success with his life. The emperor, Poland, Russia, and Venice, now concluded an alliance against the Turks, who suffered losses in every quarter:—for example, they were utterly defeated at Mohacz by Charles, duke of Lorraine. As all these misfortunes were attributed to the effeminacy and inactivity of the sultan, Mohammed IV., he was deposed in 1687, and died in prison in 1691.

**MOHAMMED ALI.**—This talented viceroy of Egypt is of Turkish origin, and was born at Cavala, in Macedonia, in the year 1769. By his boldness, sagacity, and courage, he has raised himself from a humble station to that of a sovereign, before whom Arabia and Nubia tremble, and who is flattered by his proud master the Porte. He has ruled Egypt since 1806 on European principles. From his youth Mohammed exhibited an extraordinary penetration, uncommon dexterity in all bodily exercises, and a fiery ambition. The Turkish governor at Cavala gave this poor young orphan a common education, and then an office and a rich wife. Reading and writing he learned after he had become a pacha. A merchant of Marseilles, named Lion, who lived in Cavala, and was his patron, inspired him with an inclination towards the French, and with religious tolerance, and on this account the residence of strangers in Egypt has been facilitated. In 1820 the viceroy gave the family of Lion proofs of his gratitude. His first employment was the tobacco trade, and he is now engaged in great commercial enterprises, extending even to India. His first campaign was in Egypt against the French, as commander-in-chief of the contingent of Cavala. The capitan pacha, who was a witness of his bravery in the battle of Rahmahieh against General Lagrange, elevated him to a higher post, in which he also acquired the favour of the Albanian troops. He established his reputation as a soldier in the long contest of the pachas with the mamelukes, after the French had abandoned Egypt in 1802; but soon after the governor became jealous of the ambitious Mohammed, and, to get rid of him, obtained his appointment as pacha of Saloniki. Mohammed's influence was already so great that the inhabitants of Cairo took arms in his favour, and the ulemas and sheiks represented, by agents to the divan of Constantinople, that Mohammed alone was able to restore order and tranquillity to Egypt, which the governor, Khurschid Pacha, plundered and oppressed. At the same time they conferred on him the office of governor; but the prudent Mohammed refused the external dignities of the office, although in secret he directed affairs. At length the Porte, in 1806, confirmed him as governor of Egypt, and elevated him to the rank of a pacha of three tails. He maintained himself in this office by the attachment of the Albanians and the influence of France, when the Porte had been prevailed on by the English to appoint in his stead the mameluke Elfy Bey governor of Egypt. Mohammed soon restored the distracted country to order, accustomed the undisciplined troops to obedience, and compelled the English, who in March 1807 had occupied Alexandria, after several

battles, to leave Egypt in September. He then reduced the mameluke beys to subjection, and in March 1811, on a festive occasion, perfidiously murdered 470 of them; the rest were decapitated.

From this time tranquillity reigned in Egypt. The campaign of Ibrahim Pacha, the son of the viceroy, against the Wahabees in 1816 had a successful issue; he deprived that sect of Mecca and Medina, conquered their capital, Derayah, in 1818, and sent their leaders prisoners to Constantinople. The expedition to Nubia and Sennaar in 1821, which the French traveller Cailliaud accompanied in the expectation of discovering gold mines, ended with the murder of the leader, Ismael Pacha, the youngest son of the viceroy. At the same time Mohammed directed the internal administration of affairs. Armies, and fleets, fortifications, and the maintenance of the troops, were established upon the European plan; telegraphs and congreve rockets were prepared; the ulemas were transformed into paid officers; agriculture was extended, the races of sheep and horses improved; commerce and manufactures flourished; Europeans were protected and rewarded, and learned travellers encouraged. Ismael Gibraltar and others were sent in 1818 to Europe, in order to form alliances; the canal of Mahmoud was dug, connecting Cairo with Alexandria; olive and mulberry trees, hitherto unknown in Egypt, were planted, sugar refineries, and saltpetre manufactories, and cannon foundries were established, quarantine rules and vaccination introduced, schools founded, &c.

The British, French, and other nations now sought the friendship of Mohammed. The Porte was terrified at his power, as he had during the struggle with the Greeks established himself in Candia. He was, however, appointed commander-in-chief against the Greeks in 1824; but he sent his son Ibrahim at the head of an army of 16,000 men, together with a fleet under the command of Ismael Gibraltar, who was to conquer the Morea and establish a negro colony there. The latter, with the capudan pacha, was defeated in several naval actions in September 1824 by the Greek admiral Miaulis, and Canaris, the commander of the fire-ships; but a second Egyptian expedition succeeded, in March 1825, in effecting a landing at Modon, and captured Navarino, Tripolizza, and other places. Ibrahim then laid waste the Morea, and sent its inhabitants as slaves to Egypt. In October 1827 a third expedition of the viceroy was blockaded in the harbour of Navarino by our own admiral Codrington and the French admiral De Rigny, in consequence of the treaty of July 6, 1827, and it was required of the viceroy by the allied powers, that he should refrain from every act of hostility towards Greece. The combined Turkish and Egyptian fleets were shortly after destroyed at this place. Mohammed is in reality the sovereign of Egypt, though he preserves the external marks of respect towards the grand seignior. He is a despot, and is obliged to be so; but at the same time he possesses political knowledge, and often exhibits magnanimity. He is the absolute lord of the soil and all its productions. He holds the monopoly of the productions of Egypt and of the East India goods which pass through Egypt; only a few houses designated by himself are permitted to take part in the commerce. In Egypt he protects the Greeks as well as the Franks; he causes young Turks to be educated in Paris in the European manner; the

Christians possess his confidence, but there is no security for the permanence of his plans. Ibrahim himself appears not to approve of his father's projects of colonization and civilization. Had Mohammed Ali never been stained with treachery and murder, he would perhaps deserve to be called the second Saladin of Egypt.

MOHS, FREDERIC, a learned professor of mineralogy, who was born in Anhalt Bernberg about 1774, and destined for a mercantile career, which, however, his inclination for the sciences, particularly the mathematical, induced him to abandon. After studying two years at Halle he went to Freiberg in 1798, and there became acquainted with the Wernerian geognosy, and made himself familiar with practical mining. In 1802 Mohs went to Vienna, and there drew up a description of Van der Null's "Mineralogical Cabinet," in which appear the germs of that method which was afterwards developed in his later works. His zeal for the study of mineralogy led him to make several scientific tours in different parts of Austria, and in 1810 the Austrian government employed him in similar expeditions in the public service. On the establishment of the institution at Gratz, the professorship of mineralogy was conferred on Mohs, who continued to lecture there until 1818, when he made a tour through Great Britain and examined the mines of this country. His "*Versuch einer Elementarmethode zur Naturhistorischen Bestimmung der Mineralien*" had been published in 1813. In Edinburgh he renewed his acquaintance with Jameson, who had studied with him at Freiberg, and whom he found to entertain views similar to his own on the subject of the natural history of minerals. In the year 1818 Mohs was appointed royal Saxon commissioner of the mines, and professor of mineralogy at Freiberg, and in 1826 was created professor of that science at Vienna. The principal works of Mohs are his "*Charakteristik des Naturhistor. Mineralsystems*."

MOITTE, JEAN GUILLAUME, a French statuary, who was born at Paris in 1747, of a family which produced several distinguished engravers and architects, and early displayed so much talent for drawing that Pigalle, then the most eminent sculptor in Paris, requested that he might receive the young artist as a pupil. In 1768 Moitte went to Italy and studied the remains of ancient art, without, however, neglecting the study of nature. He returned to France in 1773, was one of the first members of the national institute, received the cross of the legion of honour from Napoleon, and died in 1810. His works are distinguished for correctness of design, elevated conception, beauty of proportion, variety of expression, and delicacy of taste. A statue of a sacrificeur, the bas-reliefs of several of the barriers of Paris; that of the frontispiece of the Pantheon, representing the country crowning the civic and warlike virtues (destroyed after the restoration, when the Pantheon was consecrated as the church of St. Geneviève); that for the tomb of Desaix; several bas-reliefs in the Louvre, representing the muse of history, with Moses and Numa; warriors devoting themselves for their country, in the chamber of peers,—are among his principal productions.

MOLA, PETER FRANCIS, an eminent painter, who was born at Coldra in 1621, or at Lugano in 1619. He was the pupil of the cavalier D'Arpino and of Albani. On leaving the last master he went

to Venice, and studied under Guercino, perfecting himself in colouring from the productions of the Venetian school. On his return to Rome he painted several scriptural pieces for popes Innocent X. and Alexander VII., of which that of Joseph discovering himself to his brothers, in the Quirinal, is the most esteemed. He is still more distinguished as a landscape painter for his varied composition and vigorous touch. In 1665 he received an invitation to the court of Louis XIV., with which he was about to comply when a sudden disorder carried him off. There was another Mola, said by some to be his brother, who acquired some reputation in history and landscape, but he is much inferior to the preceding.

**MOLAI, JAMES DE**, the last grand master of the order of the knights templars, of the family of the lords of Longwic and of Raon. He was admitted into the order about 1265, and on the death of William de Beaujeu, was unanimously elected to the office of grand-master. The wealth and power of the Templars, their pride and their dissolute manners, created them a multitude of enemies and led to their destruction. In 1307 an order was issued for the general arrest of the knights throughout France. They were accused of heresy, impiety, and other revolting crimes. Fifty-seven were burnt in 1311, and the order was abolished the following year by the council of Vienne. Molai, with his companions, Guy Dauphin of Auvergne and Hugh de Peralde, were detained in prison at Paris till 1313, when their trial took place before commissioners appointed by the pope; and, confessing their crimes, they were condemned to perpetual seclusion. Molai and Guy, having subsequently retracted their confessions, which they had made in the hope of obtaining their freedom, were executed as relapsed heretics. They perished in the flames at Paris in March 1314, declaring their innocence to the last.

**MOLE, MATTHEW**, an eminent French statesman, who was born in 1584. His father, who was president of the parliament of Paris, had distinguished himself by his prudence and courage in that station during the troubles of the league, and the son gained not less honour during the disturbances of the Fronde. His integrity and fearlessness often resisted the arbitrary measures of the despotic Richelieu, and under the no less ambitious but less vigorous Mazarin he acquired the esteem of all parties. In 1614 Molé was named procureur-général, and in 1641 first president of the parliament through the influence of Richelieu, whom he had opposed in the process against the marshal de Marillac. The disturbances of the Fronde soon after commenced, and in this contest of factions Molé defended, with equal prudence and sagacity, the interests of justice and freedom as well as those of the court; and when Paris became the theatre of tumults, conducted himself with so much firmness and dignity that his bitterest enemies could not withhold from him their approbation. Even Condé and Cardinal de Retz were forced to esteem him although his unshaken rectitude and devotion to the welfare of the nation and the safety of the throne frequently frustrated their designs. At one time, indeed, wearied with the intrigues of the interested and ambitious, and unprotected by the feeble and wavering court, he voluntarily resigned the seals, and rejected the offer of a cardinal's hat for himself, and of the place of secretary of state for his son, by which Anne

of Austria wished to indemnify him for the loss of his office. But he was soon obliged to resume the difficult station, and was more than once threatened with personal violence by the furious partisans of the Fronde, whom he overawed by his inflexible dignity. These unhappy disputes between the parliament, the court, and the leaders of the Fronde, did not cease until after Louis XIV. had assumed the reigns of government: under his brilliant and artful despotism the freedom of the parliament and of the nation perished together. Molé died in 1656. In the "Memoirs of de Retz" and the other records of the time of the regency of Anne of Austria and Mazarin, Molé's influence in the troubled state is every where perceptible, and all voices agree that a better man could not have been at the head of affairs in that stormy period.

**MOLIERE, JEAN BAPTISTE POCQUELIN DE**.—This celebrated comic writer was born at Paris on the 15th of January, 1622, and designed by his father, who filled the office of valet de chambre and upholsterer to the king, for the same occupation. In his fourteenth year he enjoyed the instructions of the Jesuits, and made great progress. Gassendi, Chappelle, and Bernier, were his teachers. When his father had become debilitated he had to discharge his office about the person of Louis XIII., and in 1641 he accompanied the king to Narbonne. The French theatre had at that time begun to flourish through the talents of the great Corneille, and the young Pocquelin, who had imbibed a strong passion for the stage, now formed a company of young persons of similar tastes, and exchanged his family name for that of Molière, either from regard to his parents, as his profession was then deemed disreputable, or in imitation of other actors, and resigned the office of his father. His company soon became distinguished. During the troubles of the Fronde he is lost to our view, but after the restoration of order we find him at the head of a strolling troop which acted the "Etourdi" at Lyons in 1662. This is the first comedy written in verse by Molière. The truth of the dialogue, the inexhaustible skill of a valet, who is continually employed in rectifying the blunders of his master, the interest of the situations arising therefrom, have kept this piece on the theatre, notwithstanding the want of connexion between the parts, the coldness of the personages, and the incorrectness of the style. Molière gained equal applause as a poet and a dramatist, and drew all the spectators from another company at Lyons. Till that time all the French pieces had been full of improbable intrigues. The art of representing character and manners on the comic stage was reserved for Molière. This art, the germ of which is seen in the "Etourdi," united with the variety of incident, kept the attention of the spectators awake and concealed the faults of the piece. The "Etourdi" was acted with equal applause in Beziers, where the Prince Conti, who had known Molière at school, had just assembled the estates of Languedoc. He received the poet as a friend, and entrusted him with the charge of amusing the town and the assembly. "Le Dépit Amoureux," and "Les Précieuses Ridicules," were brought forward on the theatre of Beziers, and were admired. In the "Dépit Amoureux" the incidents are better arranged than in the "Etourdi." In the actions of the personages a genuine comic vein is exhibited, and their language displays much spirit and humour; but the plot is too complicated and the *dénouement* not sufficiently probable. The plot in the

"*Précieuses Ridicules*" is more simple. A delicate satire on the prevailing affectation of the character of *bel esprit*, and of a romantic style, on the pedantry of learned females, and affectation in language, thoughts, and dress, is the object of this comedy. It produced a general reform when it was brought forward in Paris. The spectators laughed, recognised themselves, and clapped their hands.

Louis XIV. was so well pleased with the performances of Molière's company, that he made it his own company, and gave its director a pension of 1000 francs. The "*Cocu Imaginaire*" appeared in 1660. This piece also contains a fund of sportive humour, and keeps the spectators continually amused. Censure was not silent on its appearance, but was not listened to. "*Don Garcie de Navarre*," in imitation of the Spanish, was criticized with more justice. It is a cold attempt at a more elevated style. The "*Ecole des Maris*," the idea of which is drawn from "*The Brothers*" of Terence, contains a simple and entertaining plot, and a natural *denouement*. The theatre still resounded with the applause with which this piece was received, when "*Les Fâcheux*," projected, executed, and committed to memory by the actors, within a fortnight was performed at Vaux, at the residence of Fouquet, intendant of finances, in the presence of the king and court. This comedy is almost destitute of plot, but the intention was to interest the spectators by the multiplicity of characters, the truth of the portraits, and by the elegance of the language. It is said that the king, on going away from the first performance, happening to see the count Soyecourt, a tiresome narrator of his exploits in the chase, said to Molière, "There is an original that you have not copied." In twenty-four hours the scene of the hunter was inserted, and as Molière was not acquainted with the terms of the chase, he requested Soyecourt himself to explain them to him. The "*Ecole des Femmes*" met with critics, who, overlooking the art which prevails in the management of the inferior personages, and in the natural and quick transition from one surprise to another, animadverted upon some negligences of style. Molière answered them by his spirited "*Critique de l'Ecole des Femmes*." The "*Impromptu de Versailles*" was a reprisal, occasioned by an attack of Boursault, who had written a piece against him, entitled "*Le Portrait du Peintre*." The court was very much pleased in 1664 with "*La Princess d'Elide*," a comic ballet, prepared for an entertainment given by the king. Paris, which saw this ballet without the splendour which had embellished it at Versailles, received it less favourably. Another ballet, "*Le Mariage Forcé*," is drawn from "*Rabelais*." "*Don Juan, ou le Festin de Pierre*" excited much reprehension by the impiety of some of the expressions placed in the mouth of the profligate hero. Molière retrenched the objectionable parts on the second representation. "*L'Amour Médecin*" is one of the over-hasty works, which are not to be strictly criticised. It was written, studied, and represented within five days. In this piece Molière, for the first time, attacks the physicians, which it is said he was induced to do by the fact that an ignorant and avaricious practitioner cheated him by overcharges. His great piece, "*Le Misanthrope*," was but moderately well received at first, but, in the sequel, was justly considered as one of the finest productions of modern comedy. It must, nevertheless, be allowed that it has been more admired in the closet than it has pleased on the stage

—the reason is, no doubt, because the plot is delicate and ingenious rather than lively and interesting, because the dialogue with all its beauty does not always seem necessary, and therefore retards the action, and because the *denouement*, though skilfully introduced, leaves the spectator unexcited. We may add that the "*Misanthrope*" is a more delicate and a finer satire than those of Horace and Boileau, and at least equally well written, but that there are more interesting comedies, and that the "*Tartuffe*," for example, unites the same beauties of style with a much more lively interest. In 1665 appeared the "*Médecin Malgré Lui*," a farce full of humour. "*Le Sicilien, ou l'Amour Peintre*" is a short play which pleases by its grace and gallantry. But his reputation was carried to its highest summit when the "*Tartuffe*" appeared.

In this play hypocrisy is fully unveiled; the characters are equally various and true; the dialogue is elegant and natural; the *denouement* alone is unsatisfactory. An impious and obscene farce, entitled "*Scaramouche*," having been represented at court, the king said to the great Condé, as he was leaving the theatre in his company, "I should like to know why the people, who are so much scandalized at Molière, say nothing about '*Scaramouche*.'" "The reason is," replied the prince, "that '*Scaramouche*' ridicules only God and religion, about which these people care nothing, while Molière's other pieces ridicule themselves." In 1668 Molière published his "*Amphytrion*," a free imitation of Plautus. With the exception of a tedious scene between Jupiter and Alcmena, nothing can be more humorous. "*L'Avare*," the Miser, an imitation of the "*Euclio*" of Plautus, is, in the leading character, a little overdone; but the multitude is only to be struck by strong traits. Rousseau censured this piece because the paternal authority is undervalued in it. "*George Dandin, ou le Mari Confondu*," "*Monsieur de Pourceaugnac*," "*Les Fourberies de Scapin*," are rather amusing than instructive, and "*Le Bourgeois Gentilhomme*," though mixed with some buffooneries, is highly comic and full of power. Molière bestowed more care on his "*Femmes Savantes*," a witty satire on affected taste and pedantic learning, which at that time prevailed in the Hotel de Rambouillet. The incidents are not all well connected, but the subject, dry as it may be in itself, is exhibited in a truly comic form. The development is admirable, and has been a hundred times imitated. The same is true of the "*Malade Imaginaire*," in which the quackery and pedantry of the physicians of the times are fully delineated. With this play the author concluded his career. He was indisposed when it was performed. His wife and Baron urged him not to play: "What!" he replied, "will all the poor workmen do? I could not forgive myself for neglecting, a single day, to give them bread." The exertion with which he played produced convulsions which were followed by a hemorrhage, and he died, after the lapse of a few hours, on the 17th of February, 1673. The academy did honour to itself and Molière in 1778 by erecting a bust of him, with the verse of Saurin:—

"Rien ne manque à sa gloire; il manquait à la nôtre."

The archbishop of Paris at first refused him burial; but the king himself insisted on it, and he was interred in St. Joseph. Molière is the true father of the French comedy. His works may be considered

as a history of the manners, fashions, and tastes of the times, and as the most faithful picture of human life. Born with an observing mind, skilful in catching the outward marks of the passions and emotions, he took men as they were, and, like a skilful painter, exhibited the most secret recesses of their hearts, and the tone, the action, and the language, of their various feelings. "His comedies," says Laharpe, "properly read, may supply experience, because he has depicted not mere passing follies, but human nature, which does not change. Of all who have ever written, Molière is the one who has best observed men without seeming to do so. His knowledge of human character seems to have come by intuition. His works are as pleasing when read as when performed. Molière is a writer for those of ripened age and the gray-haired. Their experience corresponds to his observations, and their memory to his genius." In his domestic relations Molière was not fully happy: he who made merry on the stage with the weaknesses of other men, could not guard against his own weakness. A violent passion induced him to marry the daughter of an actress, named Bejart, and he thereby incurred the ridicule which he had so often cast on husbands of a disproportioned age. He was more happy in the intercourse of his friends; and the marshal Vivonne, the great Condé, and even Louis XIV., admitted him to a footing of intimacy. As an actor, Molière was not to be surpassed in high comic parts, such as Arnolphe, Orgon, Harpagon, &c.

**MOLINA, JUAN IGNACIO**, a Jesuit, who was born in Chile, and, after a long residence in that country, was obliged to leave the Spanish territories on account of the dissolution and expulsion of his order. Molina retired to Italy, and published in Italian his valuable "Civil and Natural History of Chile," which has been translated into the Spanish, French, German, and English languages.

**MOLYNEUX, WILLIAM**, a learned mathematician and astronomer, who was born at Dublin in 1656, whence he removed to the Inner Temple in 1675. Being possessed of a competent fortune he never engaged in the law as a profession, but, returning to Ireland in 1678, occupied himself with researches into various departments of natural philosophy, particularly astronomy. Having been appointed joint-surveyor of public works and chief engineer, he had a commission to examine the principal fortresses in Flanders. After his return in 1686 he published his "Sciothericum Telesopicum," containing an account of a telescope-dial of his invention. In 1689 he removed to London on account of the political commotions of Ireland, and in 1692 published a treatise on dioptrics under the title of "Dioptrica Nova." Going back to his native country, he was chosen member of parliament for Dublin in 1692; and in 1695 he was elected representative of the university. He died in October 1698.

**MOLZA, FRANCESCO MARIA**, an Italian poet, who was born at Modena, in 1489, of a distinguished family. He lived principally in Rome on terms of friendly intercourse with the most eminent scholars, and died in 1544. His talents would have opened to him a brilliant career had not his excesses obstructed his progress. Among his poems the stanzas on the portrait of Giulia Gonzaga, and the "Ninfa Tiberina," a poetical picture in *ottave rime*, are the most highly esteemed.

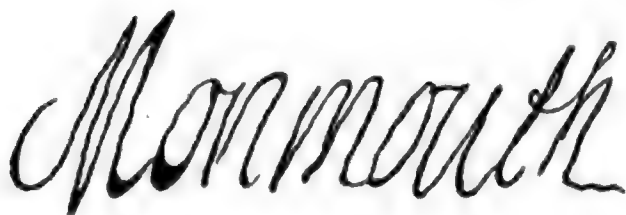

**MONGE, GASPARD**, a celebrated mathematician

and natural philosopher, who was born at Beaune in 1746, and studied in the colleges of the fathers of the oratory at Beaune and Lyons with such success that he became a teacher at the age of sixteen. He was afterwards employed at the military school of Mézières, where he assisted Bossut the professor of mathematics, and afterwards Nollet, professor of physics, whom he succeeded. In 1780 he removed to Paris, on being admitted into the academy of sciences, and became the co-adjutor of Bossut in a course of lectures on hydrodynamics at the Louvre. He quitted Mézières entirely in 1783 on being appointed examiner of the marine, when he composed "A Treatise on Statics," afterwards used for the polytechnic school. In 1789, like other friends of freedom, Monge indulged in expectations of the regeneration of France. Through the influence of Condorcet he was made minister of the marine in 1792, and he held at the same time the portfolio of minister of war during the absence of General Servan with the army. He thus became a member of the executive council of government, in which capacity he signed the order for the execution of Louis XVI. Shortly after he resigned his functions, in consequence of which he was exposed to the persecution of the ruling party of the Jacobins, against which he successfully defended himself. He was then employed, together with other men of science, in improving the manufacture of gunpowder, and otherwise augmenting the military resources of the country.

The Normal school was founded, with which Monge became connected, and he then published his "Géométrie Descriptive," one of his principal works. Together with Berthollet and Guyton Morveau he principally contributed to the establishment of the polytechnic school; after which, in 1796, he was commissioned to go to Italy, and collect the treasures of art and science from the countries conquered by the French; and the labours of Monge and his colleagues gave rise to the splendid assemblage of works of taste and genius which for a time ornamented the halls of the Louvre. In 1798 he went with Bonaparte to Egypt, where he was again employed in the service of science. On his return to France he resumed his functions as a professor at the polytechnic school, in the success of which he greatly interested himself. The attachment which he manifested to Bonaparte led to his being nominated a member of the senate on the formation of that body, and the emperor bestowed on him the title of count of Pelusium, the senatorial lordship of Liege, made him grand cordon of the legion of honour, gave him an estate in Westphalia, and, a little before he set out on his Russian expedition, a present of 200,000 francs. The fall of his benefactor involved him in misfortunes. He was expelled from the institute in 1817, one of his sons-in-law was exiled, and he was deprived of all his employments. His faculties became disordered, and he died on the 28th of July, 1818. Besides the works above noticed, Monge published "Description de l'Art de Fabriquer les Canons," and "Application de l'Analyse à la Géométrie des Surfaces," as well as a multitude of memoirs on mathematical and physical science.

**MONMOUTH, JAMES, DUKE OF**.—This nobleman was the son of Lucy Walters and Charles II. He was born at Rotterdam in 1649, and was always acknowledged by Charles, who had him carefully educated in France as his natural son. After

the restoration he was sent home, and created earl of Orkney and duke of Monmouth, and received the Garter. "He possessed," says Hume, "all the qualities which could engage the affections of the populace—a distinguished valour, an affable address, a thoughtless generosity, a graceful person. He rose still higher in the public favour on account of the universal hatred to which the duke of York on account of his religion was exposed. Monmouth's capacity was mean, his temper pliant; so that, notwithstanding his great popularity, he had never been dangerous had he not implicitly resigned himself to the guidance of Shaftesbury, a man of such a restless temper, such subtle wit, and such abandoned principles. That daring politician had flattered Monmouth with the hopes of succeeding to the crown." This character explains his whole life. In 1679 he received the command against the Scotch covenanters, whom he defeated at the battle of Bothwell Bridge, but was deprived of his command and sent out of the kingdom the same year to quiet the fears of the duke of York. He soon after returned and engaged in several conspiracies with Sidney, Shaftesbury, and other leaders, some of whom were desirous of establishing a republic; others merely wished to exclude the duke of York, while Monmouth entertained secret hopes of acquiring the crown. One of these plots, some of the parties to which were also concerned in the rye house plot, being discovered in 1683, Monmouth concealed himself for some time, but was afterwards pardoned on expressing his penitence. On the death of Charles II. the duke engaged in a conspiracy for the dethronement of James II., which ended in his apprehension and death. The autograph of this nobleman is subjoined.

MONRO, ALEXANDER, an anatomist and physician, who was born in London in 1697. Having completed his initiatory studies under the celebrated Cheselden he went to the continent for further improvement. On his return he settled at Edinburgh. He published an admirable work on Osteology, which has passed through several editions, and has been translated into various foreign languages. This work was followed by several others of equal merit. Mr. Monro died in 1767. His son was also celebrated for the excellence of his works on the anatomical structure of the human body.

MONRO, JOHN, an English physician, who was born at Greenwich in 1715, and educated first at Merchant Taylors' school and then at St. John's college, Oxford. He was for many years physician to Bridewell and Bethlem hospitals, and died on the 27th of December, 1791.

MONROE, JAMES, a celebrated president of the United States of North America, who was born in April 1758, in Westmoreland county, Virginia. He was educated at William and Mary college, and in 1776 entered the revolutionary army as a cadet. He was soon after appointed a lieutenant, and in the

summer of that year marched to New York, and joined the army under the command of General Washington. He was engaged in the battle of Harlem Heights, in that of White Plains, in the retreat through the Jerseys, and in the attack on Trenton. In the last he was in the vanguard, and received a ball through his left shoulder. For his conduct in this action he was promoted to a captaincy. General Wilkinson, in his memoirs, bears strong testimony to the gallantry and zeal of Mr. Monroe in the New Jersey campaign. He was soon after appointed aide-de-camp to Lord Stirling, and served in that capacity during the campaigns of 1777 and 1778, and was engaged in the actions of Brandywine, Germantown, and Monmouth. By entering the family of Lord Stirling he lost his rank in the line, which he was anxious to regain; but, as this could not be regularly done, Washington recommended him to the legislature of Virginia, who authorized the raising of a regiment, and gave him the command. In the exhausted state of Virginia, Colonel Monroe failed to raise his regiment, and therefore resumed the study of the law under the direction of Thomas Jefferson, then governor of Virginia. He was active as a volunteer in the militia in the subsequent invasions of Virginia, and in 1780 visited the southern army, under De Kalb, as a military commissioner, at the request of Governor Jefferson. In 1782 he was elected a member of the Virginia assembly, and in the same year, by that body, a member of the executive council, and in 1783, at the age of twenty-four, a member of the old congress, in which he served three years.

He introduced a resolution to vest in congress the power to regulate the trade with all the states, and other important resolutions, and he was appointed a commissioner to settle the controversy between New York and Massachusetts. In 1787 he was again returned to the assembly of Virginia, and in 1788 was a member of the convention of that state to decide on the present constitution of the United States. In 1790 he was elected a member of the senate, in which body he served until 1794. In 1799, on the nomination of Mr. Madison, he was appointed governor of Virginia, in which situation he served the constitutional term of three years. In 1803 he was appointed minister extraordinary to France, to act in conjunction with Mr. Livingston, the minister resident there. This mission was of the greatest consequence to his country, as it terminated in the acquisition of Louisiana. In the same year he was appointed minister to Great Britain, and the next year to Spain. In 1806, in conjunction with the late William Pinkney, he was appointed minister to London, where he pursued the negotiations with the Fox ministry. Mr. Monroe, having been prominently brought forward as a candidate for the presidency, as successor to Mr. Jefferson, had an option given him to remain at the British court or return. He returned, but soon after withdrew from the canvass. In 1810 he was again elected a member of the assembly of Virginia, and, in a few weeks after the meeting of that body, governor of that state. Shortly after he was appointed secretary of state. The war department being in a very embarrassed state on the departure of its head, General Armstrong, Mr. Monroe undertook it, and made extraordinary and very useful exertions to help the war on the lakes, and the defence of New Orleans. After he had reduced

to order the war department he resumed the duties of the department of state, which he continued to exercise until in 1817 he was chosen by the people of the United States as the successor of James Madison. In 1821 he was re-elected by a vote unanimous with a single exception, one vote in New Hampshire having been given to John Q. Adams. He was wise and fortunate in the selection of his ministers and measures. He went further than either of his two immediate predecessors in maintaining the necessity of an efficient general government, and in strengthening every arm of the national defence. He encouraged the army, increased the navy, and caused those foreign naval expeditions to be sent out to the West Indies, the Mediterranean, the coast of Africa, and the shores of South America, which gave instruction to the American officers, augmented the number of seamen, protected the national commerce, and caused the country to be universally respected by distant nations. He ordered the principal head lands and exposed points along the borders and the sea-coast to be accurately surveyed, plans of fortifications drawn, and the reports made up with a view to the ultimate complete defence of the frontiers of the United States both on the land and sea side. He directed inquiries, surveys, and plans, as to the most suitable sites for the northern and southern naval depots for the repair and accommodation of the fleets during times of war and peace. The cession of Florida by Spain to the United States was effected during his administration. He assumed high constitutional grounds in favour of internal improvement and the bank of the United States, and was mainly instrumental in promoting the pension law for the relief of indigent revolutionary soldiers. During his administration the illustrious Lafayette was invited to visit those shores as the guest of the nation. He took the most energetic measures in favour of the abolition of the slave-trade, and continued to encourage the establishment of the principles of commerce with all nations upon the basis of free and equal reciprocity. It is a high compliment to the firmness, judgment, and sagacity of Mr. Monroe, that he proclaimed to the world the determination of the United States not to suffer any European power to interfere with the internal concerns of the independent South American governments. The well-timed expression of this sentiment put an end to all rumours of any armed intervention in the affairs of Spanish America.

Colonel Monroe retired from the office of president at the end of his second term. In the late stages of his life he was associated with the ex-presidents Jefferson and Madison in founding and regulating the university of Virginia. Subsequently he was chosen a member of the convention for amending the constitution of his native state, and presided over the deliberations of that assembly. He did not disdain to act as justice of the peace in the county of Loudon, in which he resided. Mr. Monroe died at New York on the fourth day of July, 1831, the anniversary of American independence, like the ex-presidents Adams and Jefferson. Colonel Monroe's biography is intimately and honourably connected with the civil and military history of the North American States. We have merely indicated the principal stations which he held, and the nature of the services which he performed. He was one of the leaders of the democratic or Jefferson party, and involved in most of the party questions and occur-

rences by which the country was divided and agitated. He possessed a very energetic, persevering spirit, a vigorous mind, and extraordinary powers of application. In his unlimited devotion to the public business he neglected his private affairs. He retired from office extremely deep in debt—a situation from which he was relieved, though when almost too late, by liberal appropriations of congress to satisfy the large claims which he preferred on the government for moneys disbursed and debts incurred on its account.

MONSIGNY, PIERRE ALEXANDRE, a popular musical composer, who is considered as the creator of the French comic opera. He was born at Artois in 1729, and while young his talent for music was suddenly awakened by his witnessing the performance of Pergolesi's "Serva Padrona," and from that time he devoted himself entirely to that study. He learned composition under Giannotti, who dismissed him in five months as a pupil who knew all that he could teach. But Giannotti was astonished to find that his pupil had already composed an opera, "Les Aveux Indiscrets," which he brought out, after having recast it, three years afterwards. Encouraged by its success, he produced in 1760 "Le Cadi Dupé" and "Le Maître en Droit." The opera "On ne s'Avise jamais de tout," brought forward in 1761, completed the musical revolution at the théâtre de la Foire, which then took the name of the Italian Opera. "Le Roi et le Fermier," "Rose et Colas," "Aline, Reine de Golconde," "L'Isle Sonnante," "Le Déserteur," &c., were received with great applause. On the death of Grétry, Monsigny succeeded him in the institute, and on the death of Piccini in 1800 he was appointed director of the *conservatoire* at Paris. He died in 1817.

MONSTRELET, ENGUERRAND DE, a chronicler of the fifteenth century, who was born at Cambray, of which he became governor. He was the author of a history in French, of his own times, which extends from 1400 to 1467; but the last fifteen years were furnished by another hand. It contains a narrative of the contentions of the houses of Orleans and Burgundy, the capture of Normandy and Paris by the English, with their expulsion, &c. Monstrelet died in 1453.

MONTAGU, CHARLES, EARL OF HALIFAX, an English statesman and poet, who was born at Horton in Northamptonshire, in 1661. He was descended from the family of the Montagus, earls of Manchester, and was educated at Westminster school and Trinity college, Cambridge. From the university he went to London, where he attracted notice by his verses on the death of Charles II., and in 1687 he wrote, in conjunction with Prior, "The City Mouse and Country Mouse, a travesty on Dryden's 'Hind and Panther.'" In the reign of William III. he obtained the place of clerk of the privy council, and became a member of the house of commons. In 1694 he was made chancellor of the exchequer, and subsequently first lord of the treasury. His administration was distinguished by the adoption of the funding system and the establishment of the bank of England. In 1698 Montagu was a member of the council of regency during the absence of the king, and in 1700 was raised to the peerage. In the reign of Anne, when Tory influence prevailed, he was twice impeached before the house of lords, but the proceedings against him fell to the ground. George I.

created him earl and bestowed on him the order of the Garter, but Halifax being disappointed in his expectation of obtaining the office of lord treasurer he joined the opposition. His death took place on the 19th of May, 1715.

**MONTAGU, LADY MARY WORTLEY.**—This talented English lady was the eldest daughter of Evelyn, duke of Kingston, by his wife Lady Mary Fielding, the daughter of the earl of Denbigh. She was born about 1690 at Thoresby, in Nottinghamshire, and displaying uncommon abilities at an early age, was educated upon a liberal plan, and instructed by the same masters as her brother, in the Greek, Latin, and French languages. In her twentieth year she gave an extraordinary proof of her erudition by a translation of the "Enchiridion" of Epictetus, which was revised by Bishop Burnet, by whom her education was ultimately superintended. Her mind was nourished in great comparative retirement previously to her marriage in 1712 with Edward Wortley Montagu. Even after her marriage she lived chiefly at her husband's seat of Wharnccliffe, near Sheffield, until the latter, being introduced to a seat in the treasury by the earl of Halifax, brought his lady to London. Being thus placed in the sphere of the court, she attracted that admiration which beauty and elegance, joined to wit and the charms of conversation, never fail to inspire. She became familiarly acquainted with Addison, Pope, and other distinguished writers. In 1716, Mr. Wortley being appointed ambassador to the Porte, Lady Mary determined to accompany him, and hence her admirable correspondence, chiefly consisting of letters addressed to the countess of Mar, Lady Rich, and Mr. Pope, to whom she communicated her observations on the new and interesting scenes to which she was a witness.

We cannot better illustrate the nature of Lady Montagu's epistolary style than by taking a letter to one or two of these distinguished individuals. We may commence with one to Pope, written from Belgrade, which furnishes a curious specimen of her mode of living at that period:—

"I hope before this time you have received two or three of my letters. I had your's but yesterday, though dated the 3rd of February, in which you suppose me to be dead and buried. I have already let you know that I am still alive; but to say truth, I look upon my present circumstances to be exactly the same with those of departed spirits. The heats of Constantinople have driven me to this place, which perfectly answers the description of the Elysian fields. I am in the middle of a wood, consisting chiefly of fruit-trees, watered by a vast number of fountains famous for the excellency of their water, and divided into many shady walks upon short grass that seems to me artificial, but I am assured is the pure work of Nature—within view of the Black Sea, from whence we perpetually enjoy the refreshment of cool breezes, that make us insensible of the heat of the summer. The village is only inhabited by the richest amongst the Christians, who meet every night at a fountain forty paces from my house to sing and dance. The beauty and dress of the women exactly resemble the ideas of the ancient nymphs as they are given us by the representations of the poets and painters. But what persuades me more fully of my decease is the situation of my own mind, the profound ignorance I am in of what passes among the living, (which only comes to me by chance), and the great calmness with

which I receive it. Yet I have still a hankering after my friends and acquaintances left in the world, according to the authority of that admirable author:

'That spirits departed are wond'rous kind  
To friends and relations left behind,  
Which no body can deny.'

Of which solemn truth I am a dead instance. I think Virgil is of the same opinion, that in human souls there will still be some remains of human passions:

———'Curæ non ipsæ in morte relinquunt.'

And 'tis very necessary to make a perfect Elysium, that there should be a river Lethe, which I am not so happy as to find. To say truth, I am sometimes very weary of the singing and dancing, and sunshine, and wish for the smoke and impertinencies in which you toil; though I endeavour to persuade myself that I live in more agreeable variety than you do; and that Monday, setting of partridges; Tuesday, reading English; Wednesday, studying in the Turkish language, (in which, by the way, I am already very learned); Thursday, classical authors; Friday, spent in writing; Saturday, at my needle; and Sunday, admitting of visits, and hearing of music; is a better way of disposing of the week, than Monday, at the drawing-room; Tuesday, Lady Mohun's; Wednesday, at the opera; Thursday, the play; Friday, Mrs. Chetwynd's, &c., a perpetual round of hearing the same scandal, and seeing the same follies acted over and over, which here affect me no more than they do other dead people. I can now hear of displeasing things with pity, and without indignation. The reflection of the great gulf between you and me cools all news that come hither. I can neither be sensibly touched with joy or grief when I consider, that possibly the cause of either is removed before the letter comes to my hands. But (as I said before) this indolence does not extend to my few friendships; I am still warmly sensible of your's and Mr. Congreve's, and desire to live in your remembrance, though dead to all the world beside."

The other is addressed to the countess of Mar, and is dated from Constantinople. Lady Montagu says, "I have not written to you, dear sister, these many months—a great piece of self-denial. But I know not where to direct, or what part of the world you are in. I have received no letter from you since that short note of April last, in which you tell me that you are on the point of leaving England, and promise me a direction for the place you stay in; but I have in vain expected it till now, and now I only learn from the "Gazette" that you are returned, which induces me to venture this letter to your house in London. I had rather ten of my letters should be lost than you imagine I don't write; and I think it is hard fortune if one in ten don't reach you. However, I am resolved to keep the copies as testimonials of my inclination to give you, to the utmost of my power, all the diverting part of my travels, while you are exempt from all the fatigues and inconveniences. In the first place, then, I wish you joy of your niece, for I was brought to bed of a daughter five weeks ago. I don't mention this as one of my diverting adventures, though I must own, that it is not half so mortifying here, as in England, there being as much difference as there is between a little cold in the head, which sometimes happens here, and the consumption cough so common in London. No body keeps their

house a month for lying-in; and I am not so fond of any of our customs as to retain them when they are not necessary. I returned my visits at three weeks' end, and about four days ago crossed the sea, which divides this place from Constantinople, to make a new one, where I had the good fortune to pick up many curiosities. I went to see the sultana Hafiten, favourite of the late emperor Mustapha, who, you know, (or perhaps you don't know,) was deposed by his brother, the reigning sultan, and died a few weeks after, being poisoned, as it was generally believed. This lady was, immediately after his death, saluted with an absolute order to leave the seraglio, and choose herself a husband among the great men at the Porte. I suppose you may imagine her overjoyed at this proposal. Quite the contrary. These women, who are called and esteem themselves queens, look upon this liberty as the greatest disgrace and affront that can happen to them. She threw herself at the sultan's feet, and begged him to poniard her rather than use his brother's widow with that contempt. She represented to him, in agonies of sorrow, that she was privileged from this misfortune by having brought five princes into the Ottoman family, but all the boys being dead, and only one girl surviving, this excuse was not received, and she was compelled to make her choice. She chose Bekir Effendi, then secretary of state, and above fourscore years old, to convince the world that she firmly intended to keep the vow she had made, of never suffering a second husband to approach her bed; and since she must honour some subject so far as to be called his wife, she would choose him as a mark of her gratitude, since it was he that had presented her, at the age of ten years, to her last lord; but she never permitted him to pay her one visit, though it is now fifteen years she has been in his house, where she passes her time in uninterrupted mourning, with a constancy very little known in Christendom, especially in a widow of one-and-twenty, for she is now but thirty-six. She has no black eunuchs for her guard, her husband being obliged to respect her as a queen, and not to enquire at all into what is done in her apartment. I was led into a large room, with a sofa the whole length of it, adorned with white marble pillars like a ruelle, covered with pale blue figured velvet on a silver ground, with cushions of the same, where I was desired to repose till the sultana appeared, who had contrived this manner of reception to avoid rising up at my entrance, though she made me an inclination of her head when I rose up to her. I was very glad to observe a lady that had been distinguished by the favour of an emperor, to whom beauties were every day presented from all parts of the world. But she did not seem to me to have ever been half so beautiful as the fair Fatima I saw at Adrianople, though she had the remains of a fine face, more decayed by sorrow than time. But her dress was something so surprisingly rich that I cannot forbear describing it to you. She wore a vest called dualma, which differs from a caftan by longer sleeves, and folding over at the bottom. It was of purple cloth, straight to her shape, and thick set on each side, down to her feet and round the sleeves, with pearls of the best water, of the same size as their buttons commonly are. You must not suppose that I mean as large as those of my Lord —, but about the bigness of a pea; and to these buttons large loops of diamonds in the form of those gold loops so common on birth-day coats. This

habit was tied at the waist with two large tassels of smaller pearls, and round the arms embroidered with large diamonds. Her shift was fastened at the bottom with a great diamond shaped like a lozenge; her girdle, as broad as the broadest English ribband, entirely covered with diamonds. Round her neck she wore three chains which reached to her knees, one of large pearl, at the bottom of which hung a fine coloured emerald as big as a turkey-egg; another, consisting of 200 emeralds, close joined together, of the most lively green, perfectly matched, every one as large as a half-crown piece, and as thick as three crown pieces, and another of small emeralds, perfectly round. But her ear-rings eclipsed all the rest. They were two diamonds shaped exactly like pears as large as a big hazel nut. Round her talpoche she had four strings of pearl—the whitest and most perfect in the world, at least enough to make four necklaces, every one as large as the duchess of Marlborough's, and of the same shape, fastened with two roses, consisting of a large ruby for the middle stone, and round them twenty drops of large diamonds to each. Besides this her head-dress was covered with bodkins of emeralds and diamonds. She wore large diamond bracelets, and had five rings on her fingers (except Mr. Pitt's) the largest I ever saw in my life. It is for jewellers to compute the value of these things; but, according to the common estimation of jewels in our part of the world, her whole dress must be worth a hundred thousand pounds sterling. This I am sure of, that no European queen has half the quantity, and the empress's jewels, though very fine, would look very mean near her's. She gave me a dinner of fifty dishes of meat, which (after their fashion) were placed on the table but one at a time, and was extremely tedious. But the magnificence of her table answered very well to that of her dress. The knives were of gold, and the hafts set with diamonds. But the piece of luxury which grieved my eyes was the table-cloth and napkins, which were all tiffany embroidered with silk and gold, in the finest manner, in natural flowers. It was with the utmost regret that I made use of those costly napkins, which were as finely wrought as the finest napkins that ever came out of this country. You may be sure that they were entirely spoiled before dinner was over. The sherbet (which is the liquor they drink at meals) was served in china bowls, but the covers and salvers massy gold. After dinner water was brought in gold basons and towels of the same kind with the napkins, which I very unwillingly wiped my hands upon, and coffee was served in china, with gold soucoups.

"The sultana seemed in a very good humour, and talked to me with the utmost civility. I did not omit this opportunity of learning all that I possibly could of the seraglio, which is so entirely unknown amongst us. She assured me that the story of the sultan's throwing a handkerchief is altogether fabulous; and the manner upon that occasion no other than this. He sends the kysir aga to signify to the lady the honour he intends her. She is immediately complimented upon it by the others, and led to the bath, where she is perfumed and dressed in the most magnificent and becoming manner. The emperor precedes his visit by a royal present, and then comes into her apartment. She said that the first he made choice of was always after the first in rank, and not the mother of the eldest son as other writers would make us believe. Sometimes

the sultan diverts himself in the company of all his ladies who stand in a circle round him. And she confessed they were ready to die with envy and jealousy of the happy she that he distinguished by any appearance of preference. But this seemed to me neither better nor worse than the circles in most courts, where the glance of the monarch is watched, and every smile is waited for with impatience, and envied by those who cannot obtain it. She never mentioned the sultan without tears in her eyes, yet she seemed very fond of the discourse:—'My past happiness,' said she, 'appears as a dream to me; yet I cannot forget that I was beloved by the greatest and most lovely of mankind. I was chosen from all the rest to make all his campaigns with him; and I would not survive him if I was not passionately fond of the princess my daughter. Yet all my tenderness of her was hardly enough to make me preserve my life. When I left him I passed a whole twelvemonth without seeing the light. Time has softened my despair, yet I now pass some days every week in tears devoted to the memory of my sultan.' There was no affectation in these words. It was easy to see she was in a deep melancholy though her good humour made her willing to divert me.

"She asked me to walk in her garden, and one of her slaves immediately brought her a pellice of rich brocade lined with sables. I waited on her into the garden, which had nothing in it remarkable but the fountains, and from thence she showed me all her apartments. In her bed-chamber her toilette was displayed, consisting of two looking-glasses, the frames covered with pearls, and her night *talpoche* set with bodkins of jewels, and near it three vests of fine sables, every one of which is, at least, worth a thousand dollars, (200*l.* English money). I do not doubt but these rich habits were purposely placed in sight though they seemed negligently thrown on the sofa. When I took my leave of her I was complimented with perfumes as at the grand vizier's, and presented with a very fine embroidered handkerchief. Her slaves were to the number of thirty, besides ten little ones, the eldest was not above seven years old. These were the most beautiful girls I ever saw, all richly dressed; and I observed that the sultana took a great deal of pleasure in these lovely children, which is a vast expense, for there is not a handsome girl of that age to be brought under 100*l.* sterling. They wore little garlands of flowers, and their own hair braided, which was all their head-dress, but their habits were all of gold stuffs. These served her coffee kneeling, brought water when she washed, &c. It is a great part of the work of the older slaves to take care of these young girls, to learn them to embroider, and to serve them as carefully as if they were children of the family.

"Now do you imagine I have entertained you all this while with a relation that has at least received many embellishments from my hand? This, you will say, is but too like the Arabian tales. These embroidered napkins! and a jewel as large as a turkey's egg!—You forget, dear sister, those very tales were written by an author of this country, and (excepting the enchantments) are a real representation of the manners here. We travellers are in very hard circumstances: if we say nothing but what has been said before us, 'we are dull, and we have observed nothing;' if we tell any thing new, we are laughed at as 'fabulous and romantic;' not allowing either

for the difference of ranks which affords difference of company, or more curiosity, or the change of customs that happen every twenty years in every country. But the truth is, people judge of travellers exactly with the same candour, good nature, and impartiality, as they judge of their neighbours upon all occasions. For my part, if I live to return amongst you, I am so well acquainted with the morals of all my dear friends and acquaintances that I am resolved to tell them nothing at all, to avoid the imputation (which their charity would certainly incline them to) of my telling too much. But I depend upon your knowing me enough to believe whatever I seriously assert for truth, though I give you leave to be surprised at an account so new to you. But what would you say if I told you that I have been in a harem, where the winter apartment was wainscoted with inlaid work of mother of pearl, ivory of different colours, and olive wood exactly like the little boxes you have seen brought out of this country, and in whose rooms, designed for summer, the walls are all crusted with Japan china, the roofs gilt, and the floors spread with the finest Persian carpets? yet there is nothing more true. Such is the palace of my lovely friend the fair Fatima, whom I was acquainted with at Adrianople. I went to visit her yesterday; and, if possible, she appeared to me handsomer than before. She met me at the door of her chamber, and giving me her hand with the best grace in the world, 'You Christian ladies,' said she with a smile that made her as beautiful as an angel, 'have the reputation of inconstancy, and I did not expect, whatever goodness you expressed for me at Adrianople, that I should ever see you again. But I am now convinced that I have really the happiness of pleasing you; and if you knew how I speak of you amongst our ladies, you would be assured that you do me justice in making me your friend.' She placed me in the corner of the sofa, and I spent the afternoon in her conversation with the greatest pleasure in the world. The sultana Hafiten is, what one would naturally expect to find a Turkish lady, willing to oblige, but not knowing how to go about it; and it is easy to see in her manner that she has lived excluded from the world; but Fatima has all the politeness and good breeding of a court, with an air that inspires at once respect and tenderness; and now that I understand her language I find her wit as agreeable as her beauty. She is very curious after the manners of other countries, and has not the partiality for her own so common to little minds. A Greek that I carried with me, who had never seen her before (nor could have been admitted now if she had not been in my train), showed that surprise at her beauty and manner which is unavoidable at the first sight, and said to me in Italian, 'This is no Turkish lady, she is certainly some Christian.' Fatima guessed she spoke of her, and asked what she said. I would not have told her, thinking she would have been no better pleased with the compliment than one of our court beauties to be told she had the air of a Turk. But the Greek lady told it to her, and she smiled saying, 'It is not the first time I have been told so, my mother was a Poloneze, taken at the siege of Caminiec, and my father used to rally me, saying, he believed his Christian wife had found some Christian gallant, for that I had not the air of a Turkish girl.' I assured her, that if all the Turkish ladies were like her, it was absolutely necessary to confine them from

public view for the repose of mankind, and proceeded to tell her what a noise such a face as her's would make in London or Paris. 'I cannot believe you,' replied she, agreeably; 'if beauty was so much valued in your country as you say, they would never have suffered you to leave it.' Perhaps, dear sister, you laugh at my vanity in repeating this compliment, but I only do it as I think it very well turned, and give it you as an instance of the spirit of her conversation."

On many occasions Lady Montagu displayed a mind superior to common prejudices, but in none so happily as in a courageous adoption of the Turkish practice of inoculation for the small-pox in the case of her own son, and a zealous patronage of its introduction into this country. In 1718 Mr. Wortley returned to England, and at the request of Pope, Lady Mary took up her summer residence at Twickenham, and a friendship was formed between these kindred geniuses, which gradually gave way to dislike, produced by difference of political opinion, petulance and irritability on the side of the poet, and no small disposition to sarcastic keenness on that of the lady; and a literary war ensued which did honour to neither party. Lady Mary preserved her ascendancy in the world of rank and fashion until 1739, when her health declining, she took the resolution of passing the remainder of her days on the continent, not without the world surmising that other causes concurred to induce her to form this resolution. She, however, retired with the full concurrence of her husband, with whom her subsequent correspondence betrays neither resentment nor humiliation. Venice, Avignon, and Chambery, were in turn her residence until the death of Mr. Wortley in 1761, when she complied with the solicitations of her daughter, the countess of Bute, and returned to England after an absence of twenty-two years. She enjoyed a renewal of family intercourse for a short time only, as she died of a gradual decay in 1762, aged seventy-two. As a poetess, Lady Mary Wortley Montagu exhibits ease and some powers of description; but she is negligent and incorrect. The principal of her performances in this class is her "Town Eclogues," a satirical parody of the common pastoral, applied to fashionable life and manners.

MONTAGU, EDWARD WORTLEY, was the only son of Lady Mary Montagu. He was born in 1713, and at an early age he was sent to Westminster school, from which he ran away three times, and associating himself with the lowest classes of society, passed through some extraordinary adventures, sailed to Spain as a cabin-boy, and was at length discovered by the British consul at Cadiz, and restored to his family. A private tutor was then provided for him, with whom he travelled on the continent. During his residence abroad he wrote a tract entitled "Reflections on the Rise and Fall of Ancient Republics." On his return to England he obtained a seat in the house of commons; but, living extravagantly, he became involved in debt, and left his native country never to return. His future conduct was marked by eccentricities not less extraordinary than those by which he had been distinguished in the early part of his life. He went to Italy, where he professed the Roman catholic religion, and from that he apostatized to become a disciple of Mohammed and a scrupulous practiser of the formalities of Islamism. After passing many years in Egypt and other countries border-

ing on the Mediterranean, he was about to return to England, when his death took place at Padua in Italy, in 1776.

MONTAGUE, EDWARD.—This gallant naval officer was the son of Sir Sidney Montague. He was born on the 27th of July, 1625, and received all the advantages which a liberal education could bestow. Being thought more warmly affected to the cause of the parliament than his father, Sir Sidney Montague, he received a colonel's commission in 1643, to raise and command a regiment in the service of the parliament. This Colonel Montague, though only eighteen years of age, performed, and the interest of his family being very extensive, he took the field in six weeks. He was present at the storming of Lincoln on the 6th of May, 1644, which was one of the warmest actions during the civil war. He was also at the battle of Marston Moor, where he distinguished himself so much that when the city of York offered to capitulate, he was appointed one of the commissioners for settling the articles, though he was then only in his nineteenth year. The following year he was present at the battle of Naseby; and in July 1645 he stormed the town of Bridgewater; and shortly afterwards he commanded a brigade in the storming of Bristol, where he signed the articles of capitulation granted to Prince Rupert, on the delivery of that important place to the parliament. After the Dutch war was over he was promoted to the rank of an admiral in the navy, and was selected by the protector to join Admiral Blake in his expedition to the Mediterranean. In the spring of the year 1656 he went to the Mediterranean, where they took several prizes, and on his return the parliament returned him their thanks for the services he had done to the state. After the death of Oliver Cromwell, in the protectorship of his son Richard, Admiral Montague accepted the command of a large fleet which was sent to the north, on board which he embarked in the spring of the year 1659, and on the 7th of April he wrote to the king of Sweden, the king of Denmark, and the Dutch admiral, Opdam, to inform them the motives that had induced the protector to send so great a fleet into the Baltic, and that his instructions were, not to respect the private advantage of England by making war, but the public tranquillity of Europe by engaging the powers of the north to enter into an equitable peace. The parliament obliged him to act only in conjunction with their commissioners, Colonel Algernon Sidney, Sir Robert Honeywood, and Mr. Thomas Boon; and it is supposed that his displeasure at this, and at their giving away his regiment of horse, caused him to enter into a negotiation with the king, who after his restoration created him Baron Montague of St. Neots, in the county of Huntingdon; Viscount Hinchinbroke in the same county, and earl of Sandwich in Kent. He was likewise sworn a member of the privy-council, made master of the king's wardrobe, admiral of the narrow seas, and lieutenant-admiral to the duke of York, as lord-high-admiral of England.

A treaty of marriage having been concluded between King Charles II. and the infanta of Portugal, with whom he was to receive a portion of 300,000*l.*, the island of Bombay in the East Indies, and the city of Tangier in Africa, it became necessary to send a fleet to bring over the queen, and to secure the last-mentioned city against any attempt from the Moors. For this purpose the earl of Sandwich

was again sent with a numerous fleet, [which sailed on the 19th of June, 1661, from the Downs. His lordship afterwards sailed directly for Tangier, which place was put into the hands of the English on the 30th of January, 1662, when the earl of Peterborough marched into it with an English garrison, and had the keys delivered to him by the Portuguese governor. The admiral then returned to Lisbon, where he received the queen's portion, and then sailed with her majesty to England, and arrived at Spithead on the 14th of May, 1662. When the Dutch war began in 1664, the duke of York took upon him the command of the fleet as high-admiral, and the earl of Sandwich commanded the blue squadron, and by his industry and care a great number of the enemy's ships were taken. In the great battle fought on the 3rd of June, 1665, in which the Dutch lost their admiral, Opdam, and had eighteen men of war taken, and fourteen destroyed, a large share of the honour of the victory was justly given to the courage and conduct of the earl of Sandwich.

Soon after this the fleet, after having returned home to refit, was put under the command of the earl of Sandwich, as the duke of York had now repaired to court; and on the 4th of September, 1665, the earl took eight Dutch men of war, and two of their best East India ships, and twenty sail of their merchantmen. On his return to England the earl was received with distinguished marks of royal favour, and the king despatched him to the court of Madrid, to mediate a peace between the crowns of Spain and Portugal. The earl of Sandwich managed this negotiation with great ability, and not only concluded a peace between those nations, but also concluded with Spain a very advantageous commercial treaty with this country.

On the breaking out of the second Dutch war his lordship went to sea with the duke of York, and commanded the blue squadron. The fleet was at sea the beginning of May, and on the 28th of that month came in sight of the Dutch fleet, and an engagement began between the two fleets about eight o'clock in the morning. The earl, in the *Royal James*, was first attacked by a large Dutch ship, named the *Great Holland*, commanded by Captain Brackell, followed by a fire-ship, which was seconded by the Dutch rear-admiral, Van Ghent, with his whole squadron. Brackell, though of much less force, depending on the assistance of his friends who had the advantage of the wind, grappled the *Royal James*; and while the earl was engaged with him he was attacked by Van Ghent, with several other men of war and fire-ships, against all which he defended himself with great bravery. The Dutch rear-admiral, Van Ghent, was soon killed by a cannon shot; three of their fire-ships and a man of war, which would have laid the earl on board, on the other side, were sunk; and at length he was disengaged from Brackell's ship, with which he had been grappled an hour and an half, and had reduced her to the state of a wreck, wounded her commander, killed and wounded almost all his officers and above two-thirds of his men. He had now defended himself and repulsed the enemy with the greatest bravery for five hours, and it was believed might have made an honourable retreat, but he would not desist from the unequal combat, though not seconded as he ought to have been by his squadron. At length, another Dutch fire-ship, covered by the smoke of the enemy, grap-

pled the *Royal James*, and set her in flames, and the brave earl perished in her, with several other gallant officers.

Such was the end, on the 28th of May, 1672, of Edward earl of Sandwich. Bishop Parker says he was "a gentleman adorned with all the virtues of Alcibiades, and untainted by any of his vices; of high birth, capable of any business, full of wisdom, a great commander at sea and land, and also learned and eloquent, affable, liberal, and magnificent." The earl's body was found about a fortnight after the engagement, an account of which, and of his funeral, was inserted in "*The Gazette*:"—"Harwich, June 10th, 1672. This day the body of the right honourable Edward earl of Sandwich, being, by the order upon his coat, discovered floating on the sea by one of his majesty's ketches, was taken up and brought into this port, where Sir Charles Littleton, the governor, receiving it, took immediate care for its embalming and honourable disposing till his majesty's pleasure should be known concerning it; for the obtaining of which his majesty was attended at Whitehall the next day by the master of the said vessel, who, by Sir Charles Littleton's order, was sent to present his majesty with the *George* found about the body of the said earl, which remained at the time of its taking up, in every part unblemished, saving some impressions made by the fire upon his face and breast: upon which his majesty, out of his princely regard to the great deservings of the said earl, and his unexampled performances in this last act of his life, hath resolved to have his body brought up to London, there at his charge to receive the rites of funeral due to his great quality and merits." Accordingly, on the 3rd of July, the body being laid in the most solemn manner in a sumptuous barge at Deptford, was brought by water to Westminster, attended by the royal barges, the barges of the nobility, of the lord mayor, and of the several companies of the city of London, decorated suitably to the melancholy occasion; the trumpets and other music on board sounded the deepest notes expressive of sorrow: the guns of the Tower were fired as the procession passed, and those at Whitehall when the corpse was conveyed to Westminster Abbey. Eight earls supported his son Edward earl of Sandwich, the chief mourner; and most of the nobility, and other persons of quality then in town, assisted at the funeral obsequies of this illustrious admiral, whose remains were deposited in the duke of Albemarle's vault, on the north side of Henry the Seventh's chapel.

MONTAGU, ELIZABETH.—This lady, who became so celebrated in the literary world, was the daughter of Matthew Robinson, of the Rokeby family, and was born in 1720. She had an opportunity of prosecuting her studies under the direction of Dr. Conyers Middleton, to whom she was probably indebted for the tincture of learning which so remarkably influenced her character and manners. In 1742 she became the wife of Mr. Montagu, who left her mistress of a handsome fortune, which enabled her to gratify her taste for study and literary society. In 1769 she published "*An Essay on the Writings and Genius of Shakspeare*." This work raised Mrs. Montagu to the rank of an arbitress of public taste. She opened her house in Portman Square to the Blue-Stocking Club—a society so denominated from a peculiarity in the dress of Mr. Benjamin Stillingfleet, one of the members, and car-

ried on an epistolary correspondence with many men of letters. Her death took place in August 1800.

MONTAIGNE, MICHEL DE, a clever French writer, who was born in 1533. His father, Pierre Eyghem, seigneur de Montaigne, an Englishman by birth, and a brave soldier, who had been chosen mayor of Bordeaux, bestowed the greatest care on the cultivation of young Michel's promising talents, but adopted a peculiar mode of education. In order to facilitate his son's acquisition of the Latin language, which he had himself found difficult, he employed a German tutor, entirely ignorant of French, but complete master of Latin, before the child had left the nurse's arms; and as all the family were never permitted to speak any other language in the presence of the child, he had the pleasure of seeing the infant so completely matriculated into it as to be obliged to learn the French as a foreign tongue. "We all Latinized," said Montaigne, "at the castle in such a manner that several Latin expressions came into use in the villages around, which exist to this time." Greek he learned in the usual manner, after it had been attempted in vain to delude him into a knowledge of it. The treatment of his father was peculiar in some other respects; thus he caused him to be waked in the morning by the sound of musical instruments, lest the genius of the boy should be injured by his being roused too suddenly; he allowed him the most unrestrained indulgence in his plays, and endeavoured to lead him to the faithful performance of his duties solely by inspiring him with a sense of right and wrong. At the age of thirteen he had finished his studies at the college of Bordeaux, under Grouchy, Buchanan, and Muret. His father destined him for a judicial station, and married him somewhat later to Françoise de la Chassigne, daughter of a counsellor of the parliament of Bordeaux. Montaigne was for some time a parliamentary counsellor, but his aversion to the duties of the station led him to retire from it. The study of man was his favourite occupation, and to extend his observations, and to restore his health, which had been shattered by the attacks of an hereditary disease, he travelled in Germany, Switzerland, and Italy, and was every where received with great distinction. At Rome, which he visited in 1581, he received the title of a Roman citizen. In 1582 he was chosen mayor of Bordeaux, and the citizens of that place were so well satisfied with his administration that they sent him to the court in 1584 to attend to their interests there. Without doubt the order of St. Michael was conferred on him by Charles IX. at this time, without any solicitation on his part.

After making several other journeys of business, he returned to his castle, and devoted himself entirely to philosophy. His quiet, however, was disturbed by the troubles which distracted France in consequence of the cruel persecutions of the Huguenots; his castle was plundered by the leaguers, and he himself was ill-treated by their adversaries. To these causes of distress was added the plague, which broke out in Guyenne in 1586, and compelled him to leave his estate with his family, and wander through the country, which was then the theatre of all kinds of atrocities. He then resided some time in Paris, but finally returned home, and died in 1592, after much bodily suffering, with the composure of a philosopher. Montaigne has described himself in his celebrated "Essais," but he confesses only the lighter

faults. He acknowledges himself indolent and averse to restraint, and complains of the badness of his memory. He had few of what are commonly called friends, but to his chosen intimates he was warmly attached. He was also fond of the society of handsome and intelligent women, although he says one should be on his guard against them. The imagination he considered a fruitful source of evil. He had many ideas on education which have been revived in our times, without his receiving the credit of them; he wished that children should enjoy both physical and moral freedom; swathing he considered as injurious, and was of opinion that habit would enable us to dispense with all clothing. His views on legislation and the administration of justice enlightened his own age and have been useful to ours. He endeavoured to simplify the laws and legal processes, and very justly remarks that laws are often rendered futile or injurious by their excessive rigour. His moral system was in general indulgent, but on some points strict. Speculative philosophy he rejected, devoting himself to the lessons of experience. Equally removed from a general scepticism and from dogmatism, he was accustomed to suggest possibilities instead of making assertions, and to throw light on his subject from every point. His motto was "Que sais-je?" His great work, his "Essais," contains a treasure of wisdom. It may still be deemed one of the most popular books in the French language. The essays embrace a great variety of topics, which are touched upon, in a lively entertaining manner, with all the raciness of strong native good sense, careless of system or regularity. Sentences and anecdotes from the ancients are interspersed at random with his own remarks and opinions, and with stories of himself, in a pleasant strain of egotism, and with an occasional license, to which severer casuists can with some difficulty reconcile themselves. Their style, without being pure or correct, is simple, bold, lively, and energetic, and, according to La Harpe, he "impressed on the French language an energy which it did not before possess, and which has not become antiquated, because it is that of sentiments and ideas, and not alien to its idiom. It is not a book we are reading, but a conversation to which we are listening; and he persuades because he does not teach." His style, though not always pure and correct, accurate and elevated, is original, simple, lively, bold, and vigorous. Besides his essays, his voyages deserve mention, although not intended for publication. Montaigne also translated, at the request of his father, a treatise on natural theology by Raymond Sebonde.

MONTALEMBERT, MARC RENE, MARQUIS DE, was born at Angoulême in 1714, and entered the army in his eighteenth year, served in the campaign of 1733, and distinguished himself at the sieges of Kehl and Philippsburg. As a reward for his services a company of the prince of Conti's guards was given him. After the peace he devoted his leisure to the sciences, and entered the academy in 1747, whose memoirs contain some of his papers, no less remarkable for the originality of their ideas than for their purity and elegance of style. During the seven years' war he was stationed with the Russian and Swedish armies, and at later periods was sent to Brittany and the isle of Oleron, the latter of which he fortified on his new system. In 1779 he erected a wooden fort on the island of Aix, which astonished

scientific men by its strength and completeness. His extravagance obliged him in 1790 to sell his estate in the Angoumois, for which he received payment in assignats, and passed the rest of his life in poverty. As a partisan of the revolution he surrendered his pension, which had been conferred on him on account of the loss of an eye. He died in 1800. Among his works are, "La Fortification Perpendiculaire, ou Art Défensif Supérieur à l'Art Offensif," "Mémoire sur les Affûts de la Marine," "Réflexions sur le Siège de Saint Jean d'Arc," "Mémoires ou Correspondance avec les Généraux et les Ministres."

**MONTANUS.**—This ecclesiastic was, about the middle of the second century, bishop of Pepuza, in Phrygia. He was an illiterate man, who said that he was the promised comforter, who was to bring to perfect maturity the Christian system. In his doctrines he deviates from the received opinions only in maintaining that all true Christians receive the inspirations of the Holy Ghost. The chiliastic or millenarian notions, and his rigid adherence to the letter of the law, he had in common with the Judaizing Christians; and the moral peculiarities of his sect consisted merely in a more strict observance of externals, frequent fasts, the contempt of heathenish learning and worldly conveniences, abstinence from second marriage, and a willingness to submit to celibacy and martyrdom. His disciples called themselves Pneumatici, from a belief in their superior spiritual perfection; they were also called Pepuzians and Phrygians, because their doctrines principally prevailed in Phrygia and Asia Minor in general. Tertullian, himself a Montanist, defends their monastic rigour. On the other hand the Alexandrian school, which was inclined to the Gnostic dogmas, opposed their fanaticism till they became extinct, in the fourth century, with the exception of some remains which survived a short time in Gaul, where the sect had been introduced by Phrygian colonists.

**MONTCALM DE SAINT VERAN, LOUIS JOSEPH, MARQUIS OF**, a lieutenant-general in the French service, who was born near Nîmes in 1712, after receiving a careful education, entered the military service in his fifteenth year, and distinguished himself on several occasions. In 1756 he was sent to Canada as commander-in-chief of the French American colonies; and although exposed with a feeble army to the rigours of a severe climate, and neglected by the mother country, he obtained repeated advantages over Lord Loudon in the first campaign, gained a complete victory over Abercromby in the second, and fell under the walls of Quebec in 1759, in the battle with Wolfe.

**MONTECUCCOLI or PRINCE RAYMOND**, one of the greatest military commanders of modern times. He was born in the Modenese in 1608, bore arms at first in the capacity of a common soldier under his uncle, and rose successively through all the ranks. His first brilliant exploit was in 1639, when by a forced march, at the head of 2000 horse, he surprised a body of 10,000 Swedes, and captured all their artillery and baggage. Banner, however, hastened to attack the victor, and made him prisoner. Montecuccoli now passed two years of captivity in the assiduous study of the military art. In 1646 he gained a victory over General Wrangle at Triebel. After the peace of Westphalia he visited Sweden, and then returned to Modena, where, at a carousal in honour of the marriage of the duke, he had the

misfortune to kill his friend, the count Manzani. In 1657 the emperor of Germany sent him to the aid of John Casimir, king of Poland, against Ragotsky and the Swedes. Montecuccoli defeated the Transylvanians, and drove the Swedish forces from Cracow. Charles Gustavus, king of Sweden, then attacked Denmark; but Montecuccoli hastened to its defence, and relieved Copenhagen by land before the Dutch could introduce reinforcements by sea. The peace which followed this success did not leave him long in retirement: the conqueror of Ragotsky was now employed to protect that prince against the Turks. He compelled them to withdraw from Transylvania, and, by a wise system of delay, baffled all the attempts of their formidable force until the arrival of the French, by whose aid he gained the great victory of St. Gothard in 1664. This victory led to a peace, and Montecuccoli was made president of the imperial military council. On the breaking out of the war between the empire and France he was placed at the head of the imperial troops, and checked the progress of Louis XIV. by the capture of Bonn, and by forming a junction with the prince of Orange in spite of Turenne and Condé. The next year the chief command was taken from him, but was restored in 1675, that he might make head against Turenne on the Rhine. Montecuccoli was the only adversary worthy of that great commander. They spent four months in following and observing each other, each conjecturing the movements of his opponent by what would be his own in the same circumstances, and they were never deceived. They were on the point of risking a battle, when the French general was killed by a cannon ball. In the letter of Montecuccoli to the emperor, in which he speaks of the death of his great rival, he says that he cannot help regretting the loss of a man who was a honour to human nature: these words he had repeated several times on hearing the news of Turenne's death. The prince of Condé could alone dispute the superiority which that event gave him. The prince was at first worsted, but finally succeeded in making head against the imperial commander, who considered this campaign as the most glorious of his life—not because he conquered. Montecuccoli passed the remainder of his life at the imperial court, the patron of learning, and promoted the establishment of an academy for natural science. He died at Lintz in 1680.

**MONTEMAYOR, GEORGE DE**, a celebrated poet, born about 1520 in the small town of Montemayor, near Coimbra in Portugal. He was much less indebted to study than to his natural genius; but he understood several living languages, and his translations from them are characterized by ease and faithfulness. In his youth he entered the military career, although his inclination attracted him to music and poetry. He afterwards went to Castile, and, being destitute of other means of subsistence, joined the chapel of Philip II. as a singer, and accompanied that prince to Germany, Italy, and the Low Countries. After his return he appears to have lived in Leon, where he wrote his celebrated "Diana," which constitutes him the founder of the Spanish pastoral romance. Queen Catharine, sister of Charles V., and regent of the kingdom, called the poet to her court and conferred on him an honourable post. By an elegy of Francisco Marcos Dorantes, which is contained in all the editions of the "Diana," it appears that he died as early as 1562. Although a Portu-

guese by birth, he is considered as belonging to Spanish literature, as he wrote in Castilian. Cervantes calls the "Diana" the finest model of the pastoral romance. Besides that work, which is unfinished, we have a Cancionero or collection of his poems.

**MONTESPAN, FRANCOISE-ATHENAI DE ROCHECHOUART DE MORTEMART, MARCHIONESS DE.**—This lady was for many years the mistress of Louis XIV. She was born in 1641, and in 1663 was married to the marquis de Montespan. To great personal beauty she added a natural liveliness and wit, and a highly cultivated mind. On her first appearance at court, as the queen's *dame du palais*, Mlle. de la Vallière possessed the favour of the monarch; but the grace, beauty, and wit of the marchioness soon made an impression on him, and it was not long concealed from the courtiers, although the pious queen was slow to credit it—that, while that voluptuous prince already had one mistress at court, he was living with another. Her husband had been ordered to retire to his estates, and Mme. de la Vallière withdrew in 1674. The first child of this disgraceful connexion was born in 1672, and the birth was carefully concealed. The education of the children was committed to Mme. Scarron, afterwards De Maintenon, under the strictest injunctions of secrecy; but this exterior of decency was soon laid aside, and they were openly avowed. The influence of the favourite mistress was often exercised in public affairs, and her advice was often formally asked and followed. Several transient passions of the king still left her her power, until age, remorse, and a growing attachment to Mme. de Maintenon, finally overcame his passion, and the frequent quarrels of the two ladies finally estranged his affections from Mme. de Montespan. She rarely appeared at court after 1685, and in 1691 she entirely quitted it. Her last years were devoted to religious exercises, acts of benevolence, and penitence. She died in 1707.

**MONTESQUIEU, CHARLES DE SECONDAT, BARON DE LA BREDE ET DE.**—This popular French writer was descended from a noble family of Guienne, and was born on the 18th of January, 1689, at the castle of Brède, near Bordeaux. When only twenty years old, he collected materials for his "Esprit des Loix." An uncle, who was president of the parliament of Bordeaux, left him his property and office. In this sphere of action, Montesquieu tried to be useful in various ways. In the academy which was formed at Bordeaux he delivered many excellent lectures on history, sought to attract attention to the natural sciences, in his time almost entirely neglected, and, for that purpose, projected the plan of a "Histoire Physique de la Terre, Ancienne et Moderne" (which, however, as his efforts were afterwards turned in other directions, was never finished), &c. In 1721 he came before the public with his "Lettres Persanes," which he had begun in the country, and finished in the leisure hours that his business left him. This work, profound under the appearance of levity, announced a distinguished writer. It gives a most lively and correct picture of French manners: with a light and bold pencil, he portrays absurdities, prejudices, and vices, and has the skill of imparting to all an original character. All his letters are, however, not of equal value: some contain paradoxes and coarse satires against the reign of Louis XIV. These letters introduced Montesquieu into the French academy,

although this society was by no means spared in them; and Cardinal Fleury, justly offended at the Persian's mockery of the Christian religion, opposed his reception. The discourse which he delivered on the occasion of his admission, in 1728, was short, but energetic, and rich in ideas. In order to collect materials for his great work, the "Esprit des Loix," he resigned his office in Bordeaux in 1726, and, after his reception into the academy, began to travel through Germany, Hungary, Italy, Switzerland, Holland, and this country. Here he spent about two years, and was made member of the royal society of sciences in London. The result of his observation was, that Germany was the place to travel in, Italy to reside in for a time, England to think in, and France to live in.

After his return to his *château la Brède*, he finished his work "Sur les Causes de la Grandeur et de la Décadence des Romains," which first appeared in 1734. His acute remarks and excellent delineation gave to this trite subject the interest of novelty. The lofty spirit which shines in this book is still more conspicuous in the "Esprit des Loix," which appeared in 1748. In this work, which exhibits the laws of states, in their broad connexion with the other elements of public life, the author distinguishes three forms of government,—the democratic, the monarchical, and the despotic, and shows that the laws must correspond to the principles of these forms. The distinction is of great importance, and leads the author to a great variety of deductions. The style, without always being correct, is energetic. This work may be termed a code of national law, and its author may be termed the legislator of the human family: we feel that it emanates from a liberal heart, regarding the whole human race with affection. In consideration of these sentiments, Montesquieu may be forgiven for labouring to reduce every thing to a system, ascribing to climate and physical causes too much influence over the morals; for the irregularity of his work as a whole, and for having too often drawn general inferences from single cases. But it has been justly complained that we find in this chef d'œuvre many excessively long digressions respecting the feudal laws; also the testimony of travellers of doubtful credit, paradoxes instead of truths, and jests instead of reflections. He has therefore been accused of indefiniteness, forced expressions, and want of connexion. It is, however, undeniable that this book is for the philosopher a storehouse of investigations; and no one has ever reflected more profoundly than Montesquieu on the nature, foundation, manners, climate, extent, power, and peculiar character of states; on the effects of rewards and punishments; on religion, education, and commerce. To a criticism by the abbé Bonnaire, Montesquieu replied in his "Défense de l'Esprit des Loix." He died at Paris, on the 10th of February, 1755, at the age of sixty-six years. Although economical by nature, he could be generous, as in the well-known instance of his bounty at Marseilles, where he gave his purse to a young boatman, and secretly appropriated a considerable sum to release the father of the unhappy man, who had fallen into the hands of Barbary corsairs. It was not discovered till after Montesquieu's death that he was the liberator of the captive. A note respecting the remittance of a sum of money to a banker, found by his executors among his papers, led to the discovery of this act of liberal-

ty. It has given occasion to the drama "*Le Bienfait Anonyme*." His mildness, good humour, and courteousness, were always equal; his conversation easy, instructive, and entertaining. A history of Louis XI., which he had composed, was lost, being burned by the author by mistake. Under the name of "*Charles d'Outrepoint*," Montesquieu has unveiled the soul of a tyrant, in a conversation between Sulla and Eucrates. In his twenty-sixth year Montesquieu married, and the fruits of this marriage were one son and two daughters. The first published a romance in 1783, "*Arsace and Ismene*," which was probably written by Montesquieu in his younger years, and, perhaps, intended originally, as Grimm suggests, to form an episode in the "*Lettres Persanes*." To his grandson, the baron Montesquieu, who died without children in 1824, Napoleon, from respect to the author of the "*Esprit des Lois*," restored the property of his grandfather, which had been confiscated during the revolution.

**MONTEZUMA.**—This unfortunate monarch was emperor of Mexico at the time of the Spanish invasion. In 1519, when Cortes arrived on the coast of Mexico, and expressed his intention of visiting the emperor in his capital, Montezuma sent him a rich present, but forbade his farther advance. Cortes, however, heeded not this prohibition, and the emperor, intimidated, began vainly to negotiate for the departure of the Spaniards. His despotic government having made him many enemies, who willingly joined Cortes, and assisted him in his progress to Mexico, he was obliged to consent to the advance of the Spaniards, to whom he assigned quarters in the town of Cholula, where he plotted their destruction. His plot being discovered, a massacre of the Cholutans followed, and Cortes proceeded to the gates of the capital, before Montezuma determined how to receive him. His timidity prevailed, and, meeting the Spanish leader in great state, he conducted him with much respect to the quarters allotted to him. The mask was, however, soon removed: Cortes seized Montezuma in the heart of his capital, and kept him as a hostage at the Spanish quarters. He was at first treated with respect, which was soon changed into insult, and fetters were put on his legs. He was at length obliged to acknowledge his vassalage to the king of Spain, but he could not be brought to change his religion. He was constantly planning how to deliver himself and his countrymen; and when Cortes, with great part of his forces, was obliged to march out to oppose Narvaez, the Mexicans rose up and furiously attacked the Spaniards who remained. The return of their commander alone saved the latter from destruction, and hostilities were going forward when Montezuma, still the prisoner of the Spaniards, was induced to advance to the battlements of the Spanish fortress, in his royal robes, and attempt to pacify his subjects. His address only excited indignation, and, being struck on the temple with a stone, he fell to the ground. Every attention was paid to him by Cortes from motives of policy; but, rejecting all nourishment, he tore off his bandages, and soon after expired, spurning every attempt at conversion. This event took place in the summer of 1520. He left two sons and three daughters, who were converted to the catholic faith. Charles V. gave a grant of lands, and the title of count of Montezuma, to one of the sons, who was the founder of a noble family in Spain.

BIOGRAPHY.—VOL. II.

**MONTFAUCON, BERNARD DE**, a French Benedictine of the congregation of St. Maur, who was celebrated as a critic and antiquary. He was born at the castle of Soulage, in Languedoc, in 1655, and when young engaged in the military service, which he quitted, and in 1675 took the monastic vows. In 1688 he published, conjointly with fathers Lopin and Pouget, a volume entitled "*Analecta Græca, sive Varia Opuscula*." One of his great undertakings was an edition of the works of Athanasius, which appeared in 1698. He then visited Rome, where he exercised the functions of agent-general of the congregation; and on his return from Rome published an account of his observations under the title of "*Diarium Italicum*," and in 1706 a collection of the works of the ancient Greek fathers, with a Latin translation, notes, and remarks. In 1708 appeared his "*Palæographia Græca, sive de Ortu et Progressu Literarum Græcarum*." Among his subsequent labours are, the "*Hexapla of Origen*," an edition of the works of Chrysostom, and "*Les Monuments de la Monarchie Française*." The most important of his productions is the treasure of classical archæology, entitled "*L'Antiquité Expliquée et Représentée en Figures*." His death took place at the abbey of St. Germain des Prés in 1741.

**MONTFORT, SIMON DE, EARL OF LEICESTER**, son of Simon de Montfort.—This nobleman, who distinguished himself by his activity, zeal, and severity in the crusade against the Albigenses, was born in France, and in 1231 retired to England on account of some dispute with Queen Blanche. Henry III. received him very kindly, bestowed upon him the earldom of Leicester, which had formerly belonged to his ancestors, and gave him his sister, the countess dowager of Pembroke, in marriage. Henry soon after appointed him seneschal of Gascony, where he ruled so despotically that the inhabitants sent a deputation to the king, declaring that they would renounce their allegiance if Montfort was not removed. He was accordingly recalled, and, according to some accounts, examined before the lords, but acquitted. A violent personal altercation between the king and the haughty earl ensued, in which the former applied the opprobrious epithet of traitor to his subject, and the latter gave his sovereign the lie. A reconciliation was, however, effected, and De Montfort was employed on several occasions in a diplomatic and military capacity. As the dissatisfaction of the barons with the government assumed a more decided tone, the name of this nobleman is more frequently mentioned. He concerted with the principal barons a plan of reform, and in 1258 they appeared in parliament armed, and demanded that the administration should be put in the hands of twenty-four barons, who were empowered to redress grievances and to reform the state. These concessions were called the provisions of Oxford, the parliament having been holden at that place. The administration of the twenty-four guardians, at the head of whom was Leicester, continued for several years.

In 1262 Henry made an attempt to escape from their authority, but was constrained to submit by the vigour and activity of Leicester, and agreed that their power should be continued during the reign of his successor. This stipulation soon led to new troubles, and both parties finally consented to refer the subject to the arbitration of St. Louis. The barons refused to abide by his decision, and hostilities again commenced, which resulted in the triumph of Leicester

at the battle of Lewes. His arrogance and rapacity seems to have raised a powerful party against him among the barons, and, according to some, this was the motive which induced him to summon knights of shires and burgesses to the parliament which was convened in 1265. Whatever may have been his motives, however, he thus became the founder of the English house of commons. In the same year he fell at the battle of Evesham, in which the royal forces were led by Prince Edward. In attempting to rally his troops by rushing into the midst of the enemy, he was surrounded and slain. His body, after being mutilated, was laid before Lady Mortimer, the wife of his implacable enemy. His memory was long revered by the people as that of one who died a martyr to the liberties of the realm. During the succeeding reign this feeling was discouraged, but in the next generation he was called St. Simon the Righteous. Miracles were ascribed to him, and the people murmured that canonization was withheld from him. Though Simon de Montfort was slain, his lifeless remains outraged, and his acts branded as those of an usurper, yet, in spite of authority and prejudice, his bold and fortunate innovation survived. He disclosed to the world (whether conscious or not of the importance of his measure) the great principle of popular representation which has drawn forth liberty from the walls of single cities, has removed all barriers to the extent of popular governments, and has given them a regularity, order, and vigour, which put to shame the boasted energy of despotism.

**MONTGOLFIER, JACQUES ETIENNE.**—This ingenious Frenchman was the inventor of the fire-balloon. He was the son of a paper-maker, and was born at Vidalon lès Annonai in 1745, and with his elder brother, Joseph Michael, devoted himself to the study of mathematics, mechanics, physics, and chemistry. They carried on the manufactory of their father together, and were the first who made vellum-paper. Joseph was the inventor of the water-ram, which raises water to the height of sixty feet. His brother died in 1799.

**MONTGOMERY, GABRIEL, COUNT DE,** a French knight.—This brave man was the innocent cause of the death of Henry II. That prince had already broken several lances at a tournament held in 1559 in honour of the marriage of his daughter Elizabeth with Philip king of Spain, when he desired to run a tilt with the young Montgomery, then a lieutenant in the Scotch guards. The latter consented with great reluctance, but finally yielded when he saw that Henry was displeased with his refusal. In the encounter his lance struck with such violence on the visor of the king as to raise it and pass through his head, just above his right eye. The prince died eleven days after, commanding that Montgomery should not be proceeded against on account of the accident. The latter retired to his estate in Normandy, which he left for a time to travel, and returned to France at the time of the first civil war, in which he acted as a leader of the protestants. He defended Rouen with great bravery against the royal army in 1562, and on the capture of the city made his escape to Havre. On the night of St. Bartholomew's he was at Paris, but succeeded in saving himself by flight, and came over to England. In 1573 he brought a powerful fleet, partly fitted out at his own expense, to the relief of Rochelle, which was besieged by the catholics, but did not effect any thing,

and returning to Normandy connected himself with the protestant noblesse of that province. After several battles he was obliged to throw himself into the castle of Domfront, where, in spite of a vigorous resistance, he was at length overpowered on the 27th of May, 1574, and made prisoner by the royalists' general, Matignon. By the command of Catharine of Medici, Matignon transferred his captive to Paris, where he was beheaded on the 26th of June of the same year, displaying the most heroic courage on the scaffold.

**MONTGOMERY, RICHARD,** an American leader, who was born in 1737, in the north of Ireland. He embraced the profession of arms, and served under Wolfe, at Quebec, in 1759; but on his return to England he left his regiment, although his prospects of promotion were fair. He then removed to America, for which country he entertained a deep affection, purchased an estate in New York, about one hundred miles from the city, and married a daughter of Mr. Livingston. His feelings in favour of America were so well known, that on the commencement of the revolutionary struggle he was entrusted with the command of the continental forces in the northern department in conjunction with General Schuyler. The latter however fell sick, and the chief command in consequence devolved upon Montgomery, who, after various successes proceeded to the siege of Quebec. This he commenced on the 1st of December, 1775, after having formed a junction with Colonel Arnold at Point-aux-Trembles; but as his artillery was not of sufficient calibre to make the requisite impression, he determined upon attempting the capture of the place by storm. He made all his arrangements and advanced at the head of the New York troops along the St. Lawrence. He assisted with his own hands in pulling up the pickets that obstructed his approach to the second barrier, which he was resolved to force, when the only gun fired from the battery of the enemy killed him and his two aides-de-camp. The three fell at the same time and rolled upon the ice formed upon the river. The next day his body was brought into Quebec and buried without any mark of distinction. Congress directed a monument with an inscription to be erected to his memory, and placed in front of St. Paul's church in New York, and in July 1818 his remains were brought from Quebec in consequence of a resolution of the state of New York and interred near the monument.

**MONTHOLON, CHARLES TRISTAN, COUNT DE.**—This French officer, who was justly celebrated for his generous adherence to the fallen fortunes of his illustrious master, was born at Paris in 1783. His father was colonel of a regiment of dragoons, and young Montholon entered the army at the age of fifteen. He commenced his career by serving under Bonaparte on the celebrated day of the 18th of Brumaire, and was in the list of the officers who received swords as marks of distinction from the first consul on that occasion. Appointed aide-de-camp to Marshal Berthier before he had attained the age of twenty-one, he served in that capacity in every campaign subsequent to that period, and distinguished himself particularly at the battles of Austerlitz, Wagram, Jena, and Friedland. During a time when the state of his health and the effects of his wounds did not permit him to undergo the fatigues of actual military service, Napoleon employed him in

various important missions, and attached him to his own person as one of his chamberlains. He was afterwards appointed to the command of the department of the Loire, and was proceeding to oppose a vigorous resistance to the Austrians when he received the news of the emperor's abdication. His first thought was to resign his command and hasten to his master at Versailles. From this hour his fate and that of Napoleon became inseparable. He held the rank of general during the hundred days. He served Napoleon as chamberlain after the battle of Waterloo both at the palace Elysée and at Malmaison; and, finally, with his wife and children, voluntarily partook of the ex-emperor's imprisonment at St. Helena, and continued with him till the period of his decease.

MONTI, VINCENZO, one of the most celebrated modern poets of Italy, who was born at Fusignano, in the territory of Ferrara, about 1753, studied at Ferrara, after which he went to Rome, where he found patrons and was appointed secretary to Luigi Braschi, nephew of the pope. As he wore the clerical dress he was called *abbate Monti*. The Arcadia received him as a member. Excited by the fame of Alfieri he wrote two tragedies—"Galeotto Manfredi" and "Aristodemo"—the splendid style of which was indeed admired, but the plots were thought too tragic, and dramatic action was wanting. The murder of the French ambassador Basseville at Rome, gave occasion to the poem "*Basvilliana*," in which he closely imitates Dante. This work, distinguished for the splendour of some of its passages, gained him a well-deserved reputation. Two other poems, the "*Musogonia*" and "*Feroniade*," are less known in their original form, for the French having soon after entered Rome, the author suppressed the first edition and prepared a second, in which the reproaches formerly directed against Bonaparte and his army were levelled against the allied princes. Monti was now appointed secretary of the directory of the Cisalpine republic in Milan. He was accused, indeed, of having acted on a mission to Romagna the part of a new Verres, but his verses, in which he artfully flattered the existing powers, kept him in office. The campaign of Suwaroff in Italy, in 1799, obliged him to flee to France. The battle of Marengo restored him to Milan, where he sung the death of Macheroni. This poem excited almost as much admiration as the "*Basvilliana*," but as some satirical hits gave offence, he did not finish it. He was scarcely appointed professor of belles-lettres at the college of Brera, when he received an invitation to Pavia as professor of eloquence; but Napoleon appointed him historiographer of the kingdom of Italy, with the charge of celebrating his achievements. Accordingly the poet composed his "*Bardo della Selva Nera*," of which six cantos appeared in 1806. This very singular work met with strong disapprobation, against which Monti attempted a vindication in a letter to Bettinelli. He then went to Naples to join Joseph Bonaparte, where he published the seventh canto of the "*Bardo*," which was received with no more approbation. His tragedy "*Cajo Gracco*" likewise found little favour, as also some musical dramas. The poetry was considered as too close an imitation of Dante, though not without many beauties. Monti now translated the Satires of Juvenal and (without, as he confessed himself, understanding Greek) the Iliad of Homer.

In 1815 he composed for the city of Milan a can-

tata in honour of the emperor Francis. He died in October 1828. Monti cannot be denied the praise of great poetic talent; his countrymen called him *il Dante engentilito*. His "*Proposta di Alcune Correzioni ed Aggiunte al Vocabolario della Crusca*" contains a treasure of critical and lexicographical information on the Italian language.

MONTLOSIER, FRANCOIS DOMINIQUE REGNAULT, COUNT DE, was descended from an ancient family of the province of Auvergne, in which province he was born about 1760. In 1789 he was chosen deputy to the states-general by the nobility of Riom; but it was not till after the events of the 5th and 6th of October in that year that he began to take a conspicuous part in that assembly. From that period he came forward on every occasion as one of the most determined of the royalist party, and sometimes carried his zeal to a length which was prejudicial to the cause that he espoused. He did infinite mischief to the monarch by his opposition to Mirabeau, at a moment when that orator was desirous of giving his powerful support to the tottering throne. In 1791 he was guilty of a great want of foresight in voting for the self-denying decree which ordered that the members of the national assembly should not be elected to the ensuing legislative body. By this absurd decree all political influence was thrown into the hands of those who were hostile to the monarchy. M. Montlosier emigrated, and after having been employed on the continent till 1794, he settled in England, where he became the proprietor and editor of "*The Courier de Londres*," which he conducted on the same principles that he had manifested in the national assembly.

In 1800 he was selected to proceed to Paris, for the purpose of proposing to Bonaparte a sovereignty in Italy on condition of his restoring the Bourbons to the throne of France. He was arrested at Calais, and conveyed to the Temple, where however he was confined only thirty-six hours, Fouché having declared that the arrest arose from a mistake; but he was, at the same time, ordered to quit France in ten days. During those ten days he had secret audiences of the minister for the foreign department, who informed him, ostensibly in confidence, that it was the design of the first consul to re-establish the ancient church of France, to recall the emigrants, and restore the unsold property, and to destroy the remnants of Jacobinism and bring back social order. On his return to England, Montlosier began to change the tone of his journal; and the British government, in consequence, withdrew its protection from him. In 1801 the ministers of the police and foreign department invited him back to his country, and he accepted the invitation. He settled at Paris and continued his journal there, but dropped it at the end of three months, and was placed in the office of the foreign department. Though he did not give his vote on the subject of raising Napoleon to the imperial dignity, yet he retained his place. The emperor soon after ordered him to write a work on the ancient monarchy and the causes of the revolution—a task on which Montlosier was occupied for four years; and he next employed him for fifteen months as his regular correspondent on political affairs. About the close of 1812 Montlosier requested permission to travel in Italy for the purpose of making inquiries in natural history—a pursuit which he had formerly preferred to all others. His request was granted,

and he was liberally supplied with the means of travelling in comfort. After the first restoration he published his work "On the French Monarchy, from its Establishment to the Present Period," to which he subsequently added several supplementary volumes, bringing it down to the year 1821. He refused to vote for the additional act proposed by Napoleon; but he was, nevertheless, removed from office on the second return of the Bourbons.

**MONTMORENCY, ANNE DE**, peer, marshal, and constable of France.—This French nobleman was born in 1493, and was one of the greatest generals of the sixteenth century. He distinguished himself under Francis I. in the wars against Charles V., and followed his sovereign to Italy, where he was made prisoner with him at the battle of Pavia, which was fought against his advice. Francis conferred on him the dignity of constable in 1538 on account of his important public services. He afterwards, however, lost the favour of the king on account of his having advised him to trust to the professions of Charles, who while in France promised the restoration of Milan. In the reign of Henry II., Montmorency recovered his former influence, but, owing to the hatred of Catharine of Medici, lost his consideration in the reign of Francis II. The risings of the Huguenots occasioned his recall to the court of Charles IX., and he joined the duke of Guise in opposition to Condé, who was at the head of the protestants. The consequence was a civil war, which broke out in 1562. In the battle of Dreux, Montmorency was made prisoner by the Huguenots, and Condé was captured by the royal troops. The former was liberated the next year, and in the second civil war gained a decisive victory over the Huguenots, on the 10th of November, 1567, but died of the wounds received in the action.

**MONTMORENCY, HENRY II., DUKE DE**, was born in 1595, and in his eighteenth year was created admiral of France. After having defeated the Calvinists in Languedoc, and taken from them several strong places, he gained a victory over them by sea, near the island of Ré, which fell into his hands. In 1628 he gained decisive advantages over the duke de Rohan, leader of the Huguenots. During the war against Mantua, in 1630, he held the chief command in Piedmont, and defeated the Spaniards under Doria, although they were superior to him in number. This victory was followed by the relief of Casale, and his services were rewarded with the marshal's baton. Montmorency now thought himself powerful enough to brave the influence of Richelieu, and with Gaston, duke of Orleans, who was equally dissatisfied with the cardinal, raised the standard of rebellion in Languedoc. La Force and Schomberg were sent against them; they met at Castelnaudary, and Montmorency, who to inspirit his men had thrown himself into the royal ranks, was wounded and made prisoner. Gaston remained inactive. All France, mindful of his services, his virtues, and his victories, desired that the rigour of the laws might be softened in his favour; but Richelieu was resolved to make an example of the bravest, most generous, and most amiable man in France, and the marshal was condemned to death by the parliament of Toulouse. The king extended his mercy so far as to allow the execution to be private, and it took place in the *hôtel de ville*, in Toulouse, on the 30th of October, 1632.

**MONTPENSIER, ANN MARIA LOUISE**, of

Orleans.—This French lady, who is best known as Mademoiselle de Montpensier, was born at Paris in 1627, and her father, Gaston, duke of Orleans, bequeathed his eccentric, impetuous, and vindictive temper to his daughter. She joined the faction of Condé in the war of the Fronde, and had the boldness to fire upon the troops of Louis XIV. from the Bastille. This outrage awakened the hostility of the king and the court against her, so that they opposed every plan of marriage which was agreeable to her, and made only such propositions as she could not but refuse. At the age of forty-four she determined to give her hand to Count Lauzun. She obtained permission to take this step, and brought him a fortune of 20,000,000 francs, four duchies, the seignury of Dombes, the county of Eu, and the palace of Luxembourg. The contract was already concluded when the queen and the prince of Condé persuaded Louis XIV. to retract his consent. It has been supposed, however, that the parties were secretly married; but it is not settled whether it was before or after the ten years' imprisonment of Lauzun at Pignerol for his conduct towards Mad. Montespan. He finally obtained his freedom on condition that the duchess should cede the seignury of Dombes and the county of Eu to the duke of Maine. She gladly consented to this sacrifice for the sake of living with him; but her happiness was of short duration. Lauzun saw in her a violent and ambitious woman, yet glowing with the passions of youth; and she looked upon him as ungrateful, perfidious, and false. His insolence finally so exasperated the princess that she forbade him ever to appear again in her presence. She lived in retirement from that time, and died in 1693, little regretted and almost forgotten.

**MONTROSE, JAMES GRAHAM, MARQUIS OF**.—This unfortunate nobleman was a distinguished royalist under Charles I. He entered the Scotch guards in France, and on his return he excited the jealousy of the marquis of Hamilton, in consequence of which he met with such neglect that he joined the

covenanters; but afterwards returning to the royal side, he was zealous in the service of the king, and gained the battles of Perth, Aberdeen, and Inverlochy; in recompence for which he was created a marquis.

In 1645, being defeated by Lesley, he left the kingdom and remained abroad until 1650, when he went to Orkney with a few followers; but, being taken, he was conveyed to Edinburgh, where he was hanged and quartered on the 21st of May, 1650.

**MONTUCCI, ANTONIO**, one of the most learned Chinese scholars in Europe. He was born at Sienna in 1769, and studied at the university there, devoting himself to the living languages with great application. In 1785 he was made professor of English at the college Tolmei, and in 1789 accompanied Mr. Wedgwood to England as Italian teacher in his family. Here he became acquainted with four young Chinese, obtained from them a copy of the Chinese dictionary *Tching Tseu Thoung*, which was not before known in Europe, and soon formed the plan of preparing a new dictionary of the Chinese language. To meet the expense he laid his prospectus before several princes and academies, but the king of Prussia was the only person who made him an answer. He set out for Prussia; but the expedition of Napoleon disappointed his expectations of aid from the Prussian court. He continued, however, to labour on his dictionary, supporting himself by giving lessons in English and Italian. In 1812 he went to Dresden, where he continued to teach, and lectured on the Chinese language and literature. In 1827 he returned to Italy, and died in 1829. His dictionary and a part of his Chinese library had been previously purchased by Leo XII. for the instruction of the missionaries in the Vatican. He was also the author of several compilations, &c., for the study of Italian, and edited the "Poesie Inedite" of Lorenzo de' Medici, published at the expense of Mr. Roscoe in 1790.

**MONTUCLA, JOHN STEPHEN**, an eminent French mathematician, who was born at Lyons in 1725, and studied in the college of the Jesuits, and completed his education at Toulouse, with a view to the legal profession. He then engaged in practice as a counsellor, but afterwards devoted himself to the cultivation of mathematical science. He published a treatise on the quadrature of the circle; and in 1758 appeared his "*Histoire des Mathématiques*," a work of great research and ability. He was appointed secretary to the intendant of Grenoble, and subsequently went to Cayenne, with the title of royal astronomer. The latter part of his life was devoted to the augmentation of his history, of which a new edition was published at Paris in 1799, and reprinted in 1810. Montucla also published an enlarged edition of the "*Récréations Mathématiques et Physiques*" of Ozanam, an English translation of which, by Dr. Charles Hutton, appeared in 1803. His death took place in 1799.

**MOOR, SIR KAREL DE**, a portrait painter, who was born at Leyden in 1656, and at first was a disciple of Gerard Douw, with whom he continued for a considerable time. He afterwards studied successively under Abraham Vanden Tempel, Francis Mieris, and Godfrey Schalcken. His portraits are, generally speaking, imitations of Vandyck and Rembrandt. His pictures were always highly finished, and he grouped the figures of his subjects with great skill. The grand duke of Tuscany desired to have the portrait of De Moor, painted by himself, to be placed in the Florentine gallery, and on the receipt of it, that prince sent him in return a chain of gold and a large medal of the same metal. The imperial ambassador, Count Sinzendorf,

by order of his master, engaged him to paint the portraits of Prince Eugene and the duke of Marlborough on horseback; and in that performance the dignity and expression of the figures, and also the attitudes of the horses appeared so masterly that it was beheld with admiration, and occasioned many commendatory poems in elegant Latin verse to be published to the honour of the artist; and the emperor, on seeing that picture, created De Moor a knight of the holy Roman empire. He painted the portrait of Peter the Great, and an extraordinary number of other portraits, for which he received very large prices. He died in 1738.

**MOORE, DANIEL**, a learned member of the antiquarian society, who was for many years a solicitor in Lincoln's Inn. His chief employment was among the learned societies, where his love of science always ensured a hearty welcome. Mr. Moore was for some years treasurer of the royal society's club, and the height of his ambition, we believe, was to have been elected treasurer of that learned society. Of the royal institution Mr. Moore was a most valuable supporter, and at a time of need promptly lent the institution the sum of 1000*l.* without interest, and which he bequeathed to the institution by his will. To the officers of the same establishment he also left valuable memorials of his regard. Mr. Moore was a useful member of several charitable institutions. He acted as treasurer to the public dispensary, Carey Street, and to the law association for relief of decayed members of that profession. To many of these institutions he acted as solicitor, giving his professional assistance gratuitously. He was a governor of Christ's hospital, as well as Bridewell, Bethelam, Middlesex, and the French hospitals. This gentleman died on the 6th of January, 1828.

**MOORE, EDWARD**, a dramatic writer of the last century, who was a native of Abingdon, Berkshire, where he was brought up to the business of a linen-draper. His first literary work was his "*Fables for the Female Sex*," which was shortly after followed by "*The Gamester*," a tragedy, "*Gil Blas*," a comic drama, and "*The Foundling*." Soon after he became editor of a periodical called "*The World*." It contains several papers by the earl of Chesterfield in his own exquisite manner, and was supported with undeviating pleasantry by its conductor. Moore was a very unaffected writer—always easy and plain—although not always graceful or in good taste. His great excellence lay in irony; and in that style, if he has not the strength of Swift, neither has he the bitterness. All his papers are more or less ironical, and the work, as a whole, was in better keeping than most periodicals of the period. The last number of this work was published on the day of the editor's death, which event took place on the 17th of February, 1757.

**MOORE, SIR JONAS**, a learned English mathematician, who was born in 1617, and after completing his education was employed to teach the duke of York mathematics. On the breaking out of the civil war he lost his employment in the royal family, but Cromwell appointed him surveyor of the fens. After the restoration he was knighted and made governor of Greenwich hospital. He died in 1679. He was the author of several mathematical treatises.

**MOORE, JOHN**, a distinguished Scottish physician, who was born at Stirling in 1730. He re-

ceived his education at the university of Glasgow, after which he accompanied the young duke of Hamilton to the continent, where he remained for several years. On his return he published "A View of Society and Manners in France, Switzerland, and Germany." In 1785 he published his "Medical Sketches," which was followed by "Zeluco," and "Edward, or Various Views of Human Nature." He also published a collective edition of the works of Smollett, with a life of the author. Dr. Moore died on the 20th of February, 1802.

MOORE, JOHN.—This distinguished military officer was born at Glasgow in 1761. His father was the Dr. Moore whose literary celebrity has already been adverted to. At eleven years of age he had acquired much scholastic knowledge, and his father furnishes the following picture of him at that period:—"Jack is really a pretty youth; his face is of a manly beauty, his person is strong, and his figure very elegant; he dances, fences, and rides with uncommon address; his mind begins to expand, and he shows a great deal of vivacity, tempered with good sense and benevolence; he is of a daring and intrepid temper, and of an obliging disposition. He draws tolerably; he speaks, reads, and writes French admirably well; he has a very good notion of geography, arithmetic, and the easier parts of practical geometry. He is often operating in the fields, and informs me how he would attack Geneva, and shows me the weak parts of the fortification." For five years he enjoyed the advantages and pleasures of travelling, and was introduced at many foreign courts. These, however, were among the last holiday years of his life; the duke of Argyle obtained for him an ensigncy in the fifty-first regiment, and after two months spent with his family he hastened to Marseilles to embark for Minorca, which he reached early in the year 1777. Here, after having been initiated into the forms of military discipline by the veteran General Murray, the spirit of enterprise made him unwilling to remain inactive. He wrote home, and at a lucky moment for his wishes; for the duke of Hamilton had raised a regiment for immediate service, and was enabled to promote his former travelling companion to the rank of lieutenant, as well as

to appoint him paymaster. With this regiment, which, however, the duke's marriage prevented his accompanying, Moore embarked for Halifax in Nova Scotia, under the command of Brigadier-General M'Lean.

His first engagement was attended with credit to himself; we give the account of the affair in his own words:—"On the 28th, after a very sharp cannonade from the shipping upon the wood, to the great surprise of General M'Lean and the garrison, the rebels effected a landing. I happened to be upon picket that morning under the command of a captain of the seventy-fourth regiment, who, after giving them one fire, instead of encouraging his men (who naturally had been a little startled by the cannonade) to do their duty, ordered them to retreat, leaving me and about twenty men to shift for ourselves. After standing for some time, I was obliged to retreat to the fort, having five or six of my own men killed, and several wounded; I was lucky to escape untouched. This affair of the captain is only whispered; so you need not mention it." In the year 1783, peace being proclaimed with France, Spain, Holland, and the United States, Captain Moore was put upon half-pay; but he did not retire to idleness; he resumed the studies of fortification and field tactics, and when Pitt gained the ascendancy, and the coalition of Fox and North fell to the ground, he represented four Scottish boroughs in the new parliament, through the influence of his friend the duke of Hamilton.

In 1787 we find him again with the army—major to a new battalion which was added to the sixtieth regiment—in the following year, major to his first regiment, the fifty-first, which was quartered at Cork. During the years which passed before the regiment sailed for Gibraltar, in 1792, he seems to have been unwearied in disciplining his regiment, and, by uniting kindness and a proper discipline in just proportions, succeeded to his heart's content. In the middle of May 1800 he embarked with his friend Sir Ralph Abercrombie, and after sundry voyages hither and thither, took part in the Cadiz expedition, concerning which, and its abandonment, he writes to his father at some length. The conclusion of his letter is worth extracting:—"I once thought it probable I should see you this winter; of this there is now no chance, nor is there any possibility of saying when I am to have that pleasure. As these are not times for honourable ease and retirement, I have no wish to be at home until the war is over. And it must be a consolation to my mother and you, that in following the course of my profession, I am employed upon a service by much the most important that is going."

Short was the breathing time allowed him. We hear of him next in the Egyptian campaign; he was wounded in the same battle which cost us our brave Abercrombie, of whose daring he gives us an interesting anecdote:—"Sir Ralph had always been accused of exposing his person too much; I never knew him carry this so far as in this action. When it was so dark that I could scarcely distinguish, I saw him close in the rear of the forty-second regiment, without any of his family. He was afterwards joined by General Hope. When the French cavalry charged us the second time, and our men were disordered, I called and waved with my hand to him to retire, but he was instantly surrounded by the hussars. He received a cut from a sabre in the breast, which pierced through his clothes, but only grazed the flesh. He

must have been taken or killed, if a soldier had not shot the hussar." He returned home in the year 1801, in time to close the eyes of his father; and, upon his death, generously pressed his mother's acceptance of an additional annuity from himself, half of which only she would receive. During the precarious cessation of hostilities, Moore was actively employed in drilling and disciplining those regiments which were to do such good service on a future day.

In September 1804, George III. conferred upon him the order of the Bath, and in the following October news was received of his brother's having distinguished himself at sea, on which occasion he addresses his mother thus:—

"My dear Mother.

"I think I see the spectacles jumping off your nose in reading the account of Graham's success. We shall hear no more of his being relaxed. Depend upon it, that since the 5th instant, the day he fell in with the Spaniards, he has been quite well. Every body rejoices, I believe, that this good fortune has fallen to the lot of Graham Moore."

Sir John was next sent to Sicily, from whence he proceeded to Sweden, whither he was sent in command of an army destined to aid the king; but the impracticability and insanity of that monarch rendered his presence worse than useless; he was even subjected to the ignominy of an arrest, and fled secretly from Stockholm. He was well received by the duke of York on his return to London. But he was allowed no respite: his regiment was ordered to the peninsula; and, as if the campaign were doomed to be a disastrous one for him, it commenced with what he considered a personal affront, his being placed subordinate to two officers, Sir Hugh Dalrymple and Sir Harry Burrard; the first of whom had never served in the field as a general. But our limits will not permit us to trace him through the whole of his short but brilliant career; and we must at once approach to the battle field which terminated this brave soldier's life. The British army, after the most splendid and masterly retreat that has been recorded in the annals of modern warfare, harassed at all points by the rapid and skilful manœuvres of the pursuing army, and pressed with a fury that seemed to increase every moment, at length arrived at Corunna, almost entire and unbroken. Nearly 70,000 Frenchmen, led by Bonaparte, with a great superiority of cavalry, had endeavoured in vain to surround or to rout 26,000 British. Two hundred and fifty miles of country had been traversed, and mountains, defiles, and rivers had been crossed, in daily contact with their enemy.

Much baggage undoubtedly was lost, and some field-pieces abandoned; but nothing taken by force. In fine, neither Napoleon nor the duke of Dalmatia won a piece of artillery, a standard, or a single military trophy from the British army. On the 15th of January, 1809, in the course of the night, Marshal Soult, with great difficulty, established a battery of eleven guns on the rocks which formed the left of his line of battle. Laborde's division was posted on the right; half of it occupied the high ground, the other half was placed on the descent towards the river. Merle's division was in the centre. Mermet's division formed the left. The position was covered in the front of the right by the villages of Palavia Abaxo and Portosa, and in the front of the centre by a wood; the left was strongly posted on the rugged

heights where the great battery was established. The distance from that battery to the right of the English line was about twelve hundred yards, and midway, the little village of Elvina was held by the pickets of the latter nation. The late arrival of the transports, the increasing force of the enemy, and the disadvantageous nature of the ground, augmented the difficulty and danger of the embarkation.

All the encumbrances of the army were shipped in the night of the 15th and morning of the 16th, and everything was prepared to withdraw the fighting men as soon as the darkness would permit them to move without being perceived. The precautions taken would, without doubt, have ensured the success of this difficult operation, but a more glorious event was destined to give a melancholy but graceful termination to the campaign. About two o'clock in the afternoon a general movement along the French line gave notice of the approaching battle of Corunna. The British infantry, 14,500 strong, occupied the inferior range of hills already spoken of. The right was formed by Baird's division, and from the oblique direction of the range approached the enemy, while the centre and left were of necessity withheld in such a manner that the French battery on the rocks raked the whole of the line. General Hope's division, crossing the main road, prolonged the line of the right wing, and occupied strong ground abutting on the muddy bank of the Mero. A brigade from Baird's division remained in column behind the extremities of his line, and a brigade of Hope's was posted on different commanding points behind the left wing. The reserve was drawn up near Airis, a small village situated in the rear of the centre. This last point commanded the valley, which separated the right of Baird's division from the hills occupied by the French cavalry; the latter were kept in check by a regiment detached from the reserve, and a chain of skirmishers extending across the valley connected this regiment with the right of Baird's line. General Fraser's division, remaining on the heights immediately before the gates of Corunna, was prepared to advance to any point, and also watched the coast road. These dispositions were as able as the unfavourable nature of the ground would admit of, but the advantage was all on the enemy's side. His light cavalry under Franceschi, reaching nearly to the village of St. Christopher, a mile in the rear of Baird's division, obliged Sir John Moore to weaken his front, by keeping Fraser's division until Soult's plan of attack should be completely developed. There was, however, one circumstance to compensate these disadvantages. In the Spanish stores were found many thousand English muskets; the troops exchanged their old rusty and battered arms for these new ones; their ammunition also was fresh, and their fire was therefore very superior to their adversaries, in proportion to the numbers engaged.

General Laborde's division being come up, the French force could not be less than 20,000 men; and the duke of Dalmatia having made his arrangements, did not lose any time in idle evolutions, but, distributing his lighter guns along the front of his position, opened a heavy fire from the battery on his left, and instantly descended with three solid masses to the assault. A cloud of skirmishers led the way, and the British pickets being driven back in disorder, the village of Elvina was carried by the first column, which afterwards dividing, one half pushed on against

Baird's front, the other turned his right by the valley. The second column made for the centre. The third engaged the left by the village of Palavia Abaxo. The weight of the French guns overmatched the English six-pounders, and their shot swept the position to the centre. Sir John Moore observing that, according to his expectations, the enemy did not show any body of infantry beyond that which, moving up the valley, outflanked Baird's right, ordered General Paget to carry the reserve to where the detached regiment was posted, and, as he had before arranged with him, to turn the left of the French attack, and menace the great battery. Then directing Fraser's division to support Paget, he threw back the fourth regiment, which formed the right of Baird's division, opened a heavy fire upon the flank of the troops penetrating up the valley, and with the fiftieth and forty-second regiments, met those breaking through Elvina.

He then rode up to the fiftieth regiment, commanded by Majors Napier and Stanhope, who got over an inclosure in their front, and charged most gallantly. The general, ever an admirer of valour, exclaimed, "Well done the fiftieth! well done, my major!"—They drove the enemy out of the village of Elvina with great slaughter. In this conflict Major Napier, advancing too far, was wounded in several places and taken prisoner, and Major Stanhope unfortunately received a mortal wound. Sir John Moore proceeded to the forty-second, addressing them in these words, "Highlanders, remember Egypt." They rushed on, driving the French before them till they were stopped by a wall. Sir John accompanied them in this charge, and told the soldiers that he was well pleased with their conduct. He sent Captain Hardinge to order up a battalion of guards to the left flank of the Highlanders, upon which the officer commanding the light company conceived that, as their ammunition was nearly expended, they were to be relieved by the guards, and began to fall back; but Sir John discovering the mistake, said to them, "My brave forty-second, join your comrades, ammunition is coming, and you have your bayonets." They instantly obeyed, and all moved forward.

While earnestly watching the progress of the battle, Sir John Moore was struck in the left breast by a cannon-ball; the shock threw him from his horse with violence. Captain Hardinge, perceiving his situation, threw himself from his horse and took him by the hand; Sir John raised himself with some difficulty, but sat up with a countenance unaltered, gazing intently at the Highlanders warmly engaged in the ranks before him. No sigh betrayed a sensation of pain; but when informed that the forty-second were advancing his countenance immediately brightened. His friend, Colonel Graham, now dismounted to assist him, and, from the composure he assumed, entertained hopes that all would be well; but his real situation was soon perceptible; the shoulder was shattered to pieces; the arm hung by a piece of skin; the ribs over the heart broken and bared of flesh, and the muscles of the breast torn into long strips, which were interlaced by their recoil from the dragging of the shot. As the soldiers placed him in a blanket his sword got entangled, and the hilt entered the wound. Captain Hardinge attempted to extricate it, but the dying man stopped him, saying, "It is as well as it is; I had rather it should go out of the field with me." And in that manner, so becoming to a soldier, Moore was borne from the fight.

He was hastily removed into a small apartment, where he was placed on a mattress on the floor, and supported by Anderson, who had saved his life at St. Lucia, and some of the gentlemen of his staff came into the room by turns. He asked each as they entered if the French were beaten, and was answered affirmatively. They stood around; the pain of his wound became excessive, and deadly paleness overspread his fine features; yet, with unsubdued fortitude he said at intervals, "Anderson, you know that I have always wished to die this way; I hope the people of England will be satisfied; I hope my country will do me justice."

"Anderson, you will see my friends as soon as you can. Tell them—every thing.—Say to my mother—" Here his voice faltered, he became excessively agitated, and not being able to proceed, changed the subject.

"Hope!—Hope! I have much to say to him—but cannot get it out. Are Colonel Graham and my aides-de-camp safe?" At this question, Anderson, who knew the warm regard of the general towards the officers of his staff, made a private sign not to mention that Captain Burrard was mortally wounded. He then continued, "I have made my will, and have remembered my servants. Colborne has my will and all my papers." As he spoke these words, Major Colborne, his military secretary, entered the room. He addressed him with his wonted kindness; then, turning to Anderson, said, "Remember you go to Willoughby Gordon, and tell him it is my request, and that I expect he will give a lieutenant-colonelcy to Major Colborne;—he has been long with me—and I know him to be most worthy it."

He then asked the major, who had come last from the field, "Have the French been beaten?" He assured him they had on every point. "It is a great satisfaction," he said, "for me to know that we have beat the French. Is Paget in the room?" On being told he was not, he resumed, "Remember me to him; he is a fine fellow." Though visibly sinking, he then said, "I feel myself so strong—I fear I shall be long dying—It is great uneasiness—It is a great pain—Every thing Francois says is right—I have great confidence in him." He thanked the surgeons for their attendance. Then seeing captains Percy and Stanhope, two of his aides-de-camp, enter, he spoke to them kindly, and repeated to them the question, "If all his aides-de-camp were safe?" and was pleased on being told they were. After a pause Stanhope caught his eye, and he said to him, "Stanhope! remember me to your sister." He then became silent. Death, undreaded, approached; and the spirit departed, leaving the bleeding body an oblation offered up to his country.

Several public monuments have been erected to the memory of Sir John Moore, but the most imperishable is that by the poet, in which he is described as reposing,

"Like a warrior taking his rest,  
With his martial cloak around him."

MORALES, LOUIS DE, generally called *el Divino*, from his having painted nothing but sacred subjects, was born at Badajoz in 1509. His pencil is bold, his touch vigorous, yet delicate, and his pictures all have life and action. They are generally of a small size and commonly on copper. He painted hair with peculiar excellence. Morales visited all the cities of Spain which contained any *chef d'œuvre*,

and by this indiscriminate study of different masters acquired remarkable originality of manner. He died at Bajadoz in 1586. His works are scattered through Spain. The picture of St. Veronica, in the church of the bare-footed Trinitarians at Madrid, is his masterpiece.

MORANT, PHILIP, an English divine and antiquary, who was born in 1700 and educated at Oxford. Having entered holy orders, he obtained several valuable church preferments, one of which was Colchester, and in 1748 he published a history of that town. He was also the author of "A History of Essex" and many other works, which nearly all relate to English history and topography. His death took place in 1770.

MORDAUNT, CHARLES, EARL OF PETERBOROUGH, a celebrated commander both naval and military, who was born about the year 1658. While young he served under the admirals Torrington and Narborough in the Mediterranean against the Algerines, and in 1680 embarked for Africa with the earl of Plymouth, and distinguished himself at Tangier when it was besieged by the Moors. In the reign of James II. he voted against the repeal of the Test Act, and disliking the measures of the court, obtained leave to go to Holland to accept the command of a Dutch squadron in the West Indies. He afterwards accompanied the prince of Orange into this kingdom, and, upon his advancement to the throne, was sworn of the privy-council, made one of the lords of the bedchamber to his majesty, also first commissioner of the treasury, and advanced to the dignity of earl of Monmouth; but in November 1690 he was dismissed from his post in the treasury. On the death of his uncle Henry, earl of Peterborough, in 1697, he succeeded to that title, and, upon the accession of Queen Anne, was invested with the commission of captain-general and governor of Jamaica. In 1705 he was sworn a member of the privy-council, and the same year declared general and commander-in-chief of the forces sent to Spain, and joint admiral of the fleet with Sir Cloudesley Shovel, of which the year following he had the sole command. His taking Barcelona with a handful of men, and afterwards relieving it when greatly distressed by the enemy; his driving out of Spain the duke of Anjou and the French army, which consisted of 25,000 men, though his own troops never amounted to 10,000; his gaining possession of Catalonia, of the kingdoms of Valencia, Arragon, and the isle of Majorca, with part of Murcia and Castile, and thereby giving the earl of Galway an opportunity of advancing to Madrid without a blow; are astonishing instances of his bravery and conduct. For these important services his lordship was declared general in Spain by Charles III., afterwards emperor of Germany, and on his return to England he received the thanks of the house of lords. His lordship was afterwards employed in several embassies to foreign courts, installed knight of the Garter, and made governor of Minorca. In the reign of George I. he was general of all the marine forces in Great Britain, in which post he was continued by King George II. He died in his passage to Lisbon, where he was going for the recovery of his health, in 1735.

MORE, HANNAH.—This talented English lady was born at Stapleton in Gloucestershire. From this place she removed with her father to the city of Bristol, where, through the patronage of Dr. Stonehouse

and his family, Miss More was enabled to establish a large day-school, which subsequently gave place to a boarding-school. At the age of eighteen she composed some poetical works for the improvement of her pupils, one or two of whom were actually older than herself. Among these early productions was a pastoral drama, which was recited by a party of young ladies, for whom it was purposely written; and which was eagerly read and much admired by several persons of literary taste and judgment at Bristol; and, on the recommendation of Mr. Garrick, and with the consent of Dr. Stonehouse, it was issued from the Bristol press, accompanied by a prologue to Hamlet, and another to Lear, with some lyrical pieces. Such was the popularity of "The Search after Happiness" (the title of the drama) that in a few months it passed through three editions. The success of her pastoral, and the influence of so good a judge as Garrick, encouraged her to try her strength in the highest branch of dramatic poetry. Accordingly, in the following year, the tragedy of "The Inflexible Captive" was brought out, and experienced a reception sufficiently flattering to induce a continuance in the train of Melpomene. Two seasons afterwards, "Percy," the most popular of her tragic compositions, was enacted at Drury Lane, and ran for several nights. The tragedy of "Fatal Falsehood" closed the dramatic career of our author; and the same year, on the death of her much valued friend Mr. Garrick, who bequeathed to her a legacy as a token of esteem, she bade adieu for ever to theatrical amusements.

Soon after her first tragedy she sent to the press two legendary poems, entitled "Sir Eldred of the Bower," and "The Bleeding Rock," founded upon some popular traditions current among the peasantry of Mendip in Somersetshire. The success of these pieces was extraordinary, a thousand copies being sold in a fortnight. A small volume of "Essays for Young Ladies," printed in 1777, was also stamped with the public approbation; though the author thought proper to reject it from the collection of her works, published in 1801, on the ground that the book was superseded by her "Treatise on Female Education." In 1782 Hannah More made another addition to her laurels by the publication of a volume of "Sacred Dramas," with a poem annexed, entitled "Sensibility."

This poem reflected as much credit on the heart of the author as the harmonious elegance of its numbers did upon her genius. It was addressed to the honourable Mrs. Boscawen, the widow of the celebrated admiral, and the mother of the late duchess of Beaufort and the earl of Falmouth. With this lady and her noble relations Hannah More had long been acquainted; and at Badminton, the mansion of the duke of Beaufort, she frequently spent some weeks during the summer and autumn. The poetical epistle to Mrs. Boscawen forms a striking contrast to the "Dunciad of Pope," as well as to some more modern pieces in that kind of writing. Instead of casting fiery darts at the characters of her contemporaries, or abusing them with faint praise and affected friendship, the author of "Sensibility" enumerates the living ornaments of the literary sphere, and touches the distinctive excellencies of each, without so flattering or overcharging the piece as to make it doubtful whether the writer was in jest or earnest.

In the year 1786 Hannah More gave to the world

two poems, "Florio, a Tale," and "Bas Bleu, or, the Conversation." The first is an admirable satire, but not an ill-natured one, on the frivolous manners of the young gentlemen of that period. The other takes its title and subject from the literary assemblies held at the house of Mrs. Montagu, in Portman Square. These meetings obtained the name of the blue stocking club, from the circumstance of one of the members, Mr. Benjamin Stillingfleet, always wearing that article of dress. The next publication of our author was "A Poem on the Slave Trade," printed in 1788, when the cause of the Africans had begun to rouse the spirit of philanthropy throughout the kingdom. Situated, as the poet had long been, in one of the principal marts for carrying on this nefarious traffic, it was next to impossible that she could be indifferent to what was no less offensive to morality than repugnant to the precepts of Christianity. In the same year appeared a small tract, entitled "Thoughts on the Manners of the Great."

To counteract the mischievous tendency of the publications which were at this time industriously circulated among the lower classes by societies formed on the French revolutionary plan, Mrs. More also printed a tract entitled "Village Politics, in a Dialogue between Two Mechanics." The success of this little work induced the authoress to continue her labours for the instruction of those who were in danger of being deceived by the propagators of sedition and infidelity. Accordingly, in 1795 she commenced at Bath "The Cheap Repository," which was published in monthly numbers, and contained those admirable tales,—The Shepherd of Salisbury Plain—The History of Mr. Fantom, the Philosopher, and his Man Wilson—The Two Shoemakers—The Two Wealthy Farmers—The History of Black Giles the Poacher, and his Wife Rachel—All for the Best—A Cure for Melancholy; with several other entertaining and edifying pieces written in a popular style, and calculated to make a lasting impression on the mind. The effect of this seasonable publication was astonishing. Within a few months 750,000 copies were sold; and before the next year the sale had reached the number of 1,000,000; with such an increasing demand for the tales in a separate state that the press could scarcely keep up with the call of the public.

In 1791 Mrs. More and her sisters terminated their honourable labours in the education of young ladies, and, having acquired a competency with which to retire from that employment, they purchased a house at Bath; between which city and Cowslip Green, a small but elegant cottage near Wrington, their time was divided.

In 1799 Mrs. More published her "Strictures on the Modern System of Female Education," three editions of which appeared the same year. That part of this work devoted to the most important of all concerns, the inculcation of religious practice upon Christian principles, while it afforded pleasure to one class of readers, had a contrary effect upon others, and those too of the greatest weight and influence in society. Some of the periodical critics censured the authoress as unjust in her strictures and severe in her precepts. By one eminent dignitary of the church her opinions were pronounced to be Calvinistic. So little, however, was the treatise or its authoress affected by these remarks that the sale of the former increased, and the latter was desired by the highest personages in the realm to put her sentiments in writing on the proper course of instruction to be adopted for the infant heiress to the British throne. This, though a flattering commission, was also one of a delicate nature; the discharge of which involved many different interests and objects out of the ordinary line of didactic composition. Hannah More had long since given up the world and its honours; but she could not, consistently with her loyalty and strong sense of duty, decline an office calculated for the public good. She accepted the trust, relinquished her house at Bath, and retired to Barley Wood. Here she went diligently to work, and in 1805 published the result of her observations in two volumes, but without a name, and under the unassuming title of "Hints towards forming the Character of a Young Princess." The work was dedicated to Dr. John Fisher, bishop of Exeter, who had been appointed tutor to the princess Charlotte of Wales while the second volume was passing through the press. Both in the dedication and in the preface, great care was taken to avoid the appearance of having received a high sanction for the composition of the treatise. This caution would have been proper under any circumstances; but in those of the royal family it became doubly expedient. In the preface the following apology was offered, to guard against the charge of presumptuous obtrusion:—"The writer is very far indeed from pretending to offer any thing approaching to a system of instruction for the royal pupil; much less from presuming to dictate a plan of conduct to the preceptor. What is here presented is a mere outline, which may be filled up by far more able hands; a sketch which contains no consecutive details, which neither aspires to regularity of design nor exactness of execution. To awaken a lively attention to a subject of such moment,—to point out some circumstances connected with the early season of improvement, but still more with the subsequent stages of life,—to offer not a treatise on education, but a desultory suggestion of sentiments and principles,—to convey instruction, not so much by precept or by argument, as to exemplify it by illustrations and examples,—and, above all, to stimulate the wise and the good to exertions far more effectual,—these are the real motives which have given birth to this slender performance."

In 1809 appeared a tale, in two volumes, entitled

"Cœlebs in Search of a Wife." Though the work was unaccredited by any name, the world immediately ascribed it to Hannah More; and such was the effect of the impression that six editions were sold in the course of the year. This was the first attempt of our authoress at novel-writing, and she was led to adopt that mode of conveying instruction now from a wish to turn the popular taste to a moral and religious purpose. The object of the work is to exhibit the dispositions, manners, attainments, and principles necessary to ensure domestic happiness.

In 1811, and the following year, Mrs. More favoured the world with two very valuable treatises, closely connected with each other in subject:—the first entitled "Practical Piety; or, the Influence of the Religion of the Heart on the Conduct of Life;" the second, "Christian Morals." The preface to the "Christian Morals" was intended as a literary farewell to the public, in a grateful acknowledgment for a long continuance of patronage, and an apology for another appearance in the world as an instructress. But though, apparently, Mrs. More now took a final leave of the press, which she had for so many years employed honourably to herself and beneficially to the world, her active mind still laboured with delight in the momentous cause to which her talents had uniformly been devoted. In 1815 she published one of the ablest of her performances, "An Essay on the Character and Writings of St. Paul." This work is neither biographical nor critical, but purely practical; exhibiting in the conduct of the great apostle of the Gentiles all the attractive and inimitable beauty of the Christian life. The object sought to be established is the edification and encouragement of the reader, by delineating the brightest example of human perfection upon record.

Of that picturesque spot, Barley Wood, of which we give a sketch in the subjoined engraving, and of

its talented inhabitant, the following interesting account was given in a letter from a visitant during the winter before Mrs. More took up her abode at Clifton:—"Before we came in sight of the little town of Wrington, we entered an avenue, thickly bordered with luxuriant evergreens, which led directly to the cottage of Barley Wood. As we drew nearer to the dwelling a thick hedge of roses, jessamine, woodbine, and clematis, fringed the smooth and sloping lawn on one side; on the other, laurel and laurestinus were in full and beautiful verdure; from the shrubbery the ground ascends, and is well wooded

by flowing larch, dark cypress, spreading chestnut, and some lordly forest trees. Amid this mélange rustic seats and temples occasionally peep forth, and two monuments are particularly conspicuous; the one to the memory of Porteus, the other to the memory of Locke. As the latter was an inhabitant of Wrington, Hannah More, with her usual good taste, erected the memorial within sight of his native village.

"I was much struck by the air of affectionate kindness with which the old lady welcomed me to Barley Wood; there was something of courtliness about it, at the same time the courtliness of the *vieille cour* which one reads of, but so seldom meets. Her dress was of light green Venetian silk; a yellow richly embroidered crape shawl enveloped her shoulders; and a pretty net cap, tied under her chin with white satin riband, completed the costume. Her figure is singularly *petite*; but to have any idea of the expression of her countenance you must imagine the small withered face of a woman in her eighty-seventh year; and imagine also (shaded, but not obscured, by long and perfectly white eye-lashes) eyes dark, brilliant, flashing, and penetrating; sparkling from object to object with all the fire and energy of youth, and smiling welcome on all around.

"When I first entered the room Lady S—— and her family were there: they soon prepared to depart; but the youngest boy, a fine little fellow of six, looked anxiously in Mrs. More's face after she had kissed him, and his mamma said, 'You will not forget Mrs. Hannah, my dear?'—he shook his head. 'Do not forget me, my dear child,' said the kind old lady, assuming a playful manner, 'but they say your sex is naturally capricious: there, I will give you another kiss; keep it for my sake, and when you are a man, remember Hannah More.'—'I will,' he replied, 'remember that you loved children.' It was a beautiful compliment.

"After a good deal of conversation on indifferent topics she commenced showing us her curiosities, which are numerous and peculiar: gods, given up by the South Sea islanders to our missionaries—fragments of oriental manuscripts—a choice, but not numerous, collection of books, chiefly in Italian, English, and French (for she speaks all those languages with equal fluency); and, above all, a large collection of autographs containing her correspondence with Garrick, Johnson, Burke, Reynolds, Porteus; and manuscripts also in the handwriting of Lord Chesterfield, Chatterton, Addison, Swift, Atterbury, Sir R. Steele, &c. &c.: one that particularly interested me was a letter from the little Prince Edward to our Queen Elizabeth, written in French.

" 'I will now,' she said, 'show you some monuments of the days of my wickedness;' and she produced a play-bill, where 'Miss More's new Tragedy of Percy' was announced; exactly fifty-two years ago! She looked to me at that moment, as a resurrection from the dead; more particularly when she added, 'Johnson, Burke, Garrick, Reynolds, Porteus—all—the associates of my youth, are gone; nor is there one amongst them whom I delight in praising more than David Garrick. In his house I made my entrance into life, and a better conducted house I never saw. I never could agree in the latter part of the sentiment,—

"On the stage he was natural, simple, affecting,—  
It was only that when he was off he was acting;"

and only regret that this species of acting is not more practised by the world at large. I have never been to a play since his death; I could not bear it.' She told me that it was nine years since she was down stairs: 'but I am like Alexander Selkirk,' she added, laughing, 'monarch of all I survey—every tree on this little domain was planted by my own hands, or under my special direction.' I bade her adieu with regret, for I never had the good fortune to meet with so perfect a relic of a well-spent life. The spirit within was as warm and cheerful as if the blood of eighteen, instead of eighty, circulated in her veins. She is indeed a woman who has lived to good purpose."

In 1819 she printed "Modern Sketches," being a series of moral portraits drawn from real life. Most of these had appeared from time to time in the early volumes of "The Christian Observer," together with others, which the writer afterwards transferred in a more lively form to the pages of *Cœlebs*. With this publication the literary history of Mrs. More terminated; but, though advanced beyond the ordinary period of mortality, and rendered incapable of moving from one room to another without assistance, she preserved her strength of mind and acuteness of judgment when she had numbered more than four-score years. As the sun went down upon her useful life, and eternity opened to her view, she was still enabled to bear a faithful testimony to the truths which she had in so many publications explained and defended. In the last awful hour she spoke of her state of mind and prospects with the calm piety of a humble believer; assuring a friend that she reposed her hopes of salvation on her Saviour's merits alone, expressing at the same time a firm and joyful reliance on his unchangeable promises. In this happy frame she continued till the 7th of September, 1833, when her spirit passed out of time into eternity.

On the 13th of the same month the remains of Mrs. Hannah More were removed for interment with those of her sisters in Wrington churchyard. She wished her funeral should be devoid of public paraphernalia; but, in its stead, suits of mourning to be given to fifteen poor old men of her acquaintance. On passing through Bristol, all the bells of the churches tolled: at the entrance of her native parish the scene was imposing. About a mile from Wrington all the gentlemen of the neighbourhood met the procession; and for the last half-mile the road on each side was lined with villagers, chiefly in black, scarcely one without a riband. At the entrance of the village charity children, amounting to more than two hundred, with a great number of the clergy in their gowns, headed the procession.

We cannot close the life of this authoress without giving one specimen of her peculiar style of composition. The following extract is intended to illustrate phraseologists. Mrs. More says,—“Their religion consists more in a sort of spiritual gossiping than holiness of life. They diligently look out after the faults of others, but are rather lenient to their own. They accuse of being legal those who act more in the service of Christianity and dispute less about certain opinions. They overlook essentials, and debate rather fiercely on, at best, doubtful points of doctrine, and form their judgment of the piety of others rather from their warmth in controversy than from their walking humbly with God. They always exhibit in their conversation the idiom of a party, and

are apt to suspect the sincerity of those whose higher breeding and more correct habits discover a better taste. Delicacy with them is want of zeal; prudent reserve, want of earnestness; sentiments of piety, conveyed in other terms than are found in their vocabulary, are suspected of error. They make no allowance for the difference of education, habits, and society: all must have one standard of language, and that standard is their own.

“Even if on some points you hold nearly the same sentiments, it will not save your credit; if you do not express them in the same language, you are in danger of having your principles suspected. By your proficiency or declension in this dialect, and not by the greater or less devotedness of your heart, the increasing or diminishing consistency in your practice, they take the gauge of your religion, and determine the rise and fall of your spiritual thermometer. The language of these technical Christians indisposes persons of refinement, who have not had the advantage of seeing religion under a more engaging form, to serious piety, by leading them to make a most unjust association between religion and bad taste. When they encounter a new acquaintance of their own school, these reciprocal signs of religious intelligence produce an instantaneous sisterhood; and they will run the chance of what the character of the stranger may prove to be, if she speaks in the vernacular tongue. With them words are not only the signs of things but things themselves.”

MORE, HENRY, a learned English divine, who was born in 1614. He was the son of a gentleman of good estate who educated him at Eton, from which establishment he was sent to Christ's college, Cambridge, in 1631. While at the university he studied the most celebrated systems of philosophy, and finally settled into a decided preference for that of Plato and for his followers of the school of Alexandria. In 1639 he graduated M. A., and in the following year published his "Psycho-Zoia, or the First Part of the Song of the Soul, containing a Christiano-Platonical Display of Life." Having been elected a fellow of his college, he became a tutor to several persons of rank. In 1675 he accepted a prebend in the church of Gloucester, which it is supposed he took only to resign it to his friend Dr. Fowler. He also gave up his rectory of Ingolsby, in Lincolnshire, the perpetual advowson of which had been purchased for him by his father, and would never afterwards accept of preferment of any kind, refusing deaneries, bishoprics, and even the mastership of his own college, so desirous was he of unmolested study. During the civil war, although he refused to take the covenant, he was left unmolested. In 1681 he became a fellow of the royal society, and for twenty years after the restoration his writings are said to have sold better than any other of their day. Dr. More died in September 1687, leaving behind him the character of a man of profound learning and great genius, alloyed by a deep tincture of enthusiasm, chiefly coloured by the supposition that divine knowledge had been communicated to Pythagoras by the Hebrews and from him to Plato. He was also persuaded that supernatural communications were made to him by God's appointment, by a particular genius, like that of Socrates. The most admired of his works are his "Enchiridion Ethicum" and "Divine Dialogues Concerning the Attributes and Providence of God."

**MORE, SIR THOMAS.**—England has produced but few men who, for high moral attainments and political knowledge, could vie with this eminent statesman and philosopher. He was born in Milk Street, Cheapside, in 1480; he received the rudiments of his education at a free school in London, and was afterwards placed in the house of Cardinal Morton, who used frequently to say when at table that “who-soever shall live to see it, this child here, who waits at table, will prove a surprising man.” In 1497 he went to Oxford, and after remaining there two years, removed to New Inn, and soon afterwards to Lincoln’s Inn to pursue his studies for the bar. As soon as he was of age he was elected a member of parliament, and in 1503 offended King Henry VII. by successfully opposing a subsidy to that monarch; a circumstance which cost his father his liberty for some time; Henry, out of revenge, imprisoned Sir John More in the Tower. On the accession of Henry VIII., More’s prospects brightened, and a fair field opened itself for the exertion of his amazing talents and industry. As he was himself very learned and liberal, he was a friend and patron of learned men, among whom may be mentioned, Erasmus, Dean Colet, Linacre, Lilly, and Grocious. At this time he had just married. The partner whom he selected was chosen on a principle of rare self-denial and generosity. “When he fell to marrying,” says his biographer, “he took to wife the daughter of one Mr. Colt, a gentleman of Essex, who had three daughters, very virtuous and well-liking. And, albeit, his mind served him most to settle his affection on the second sister, for that he conceived her fairest and best favoured; yet when he considered it would be a grief to the eldest to see her younger sister preferred before her, he then, of a certain pity, framed his fancy to the eldest.”

His first preferment was in the city, being made judge of the sheriff’s court in 1510, and before he was actually engaged in the government service, he was twice appointed, by the consent of Henry VIII., at the suit of the English merchants, their agent in some causes between them and the foreign merchants of the steel-yard, in which he acquitted himself so well that Cardinal Wolsey was anxious to engage More in his majesty’s service. But he was so averse to change the condition of an independent man for that of a courtier that the minister could not prevail, and the king for the present was pleased to admit of his excuses. It happened, however, some time after that a ship of the pope’s arriving at Southampton, the king claimed it as a forfeiture, upon which the legate demanded a trial with a counsel for his holiness, learned in the laws of the kingdom; and desired that the cause might be heard in the royal presence. Henry acceded to this, and Mr. More was chosen counsel for the pope; whose cause he pleaded with so much success, that the forfeiture which the crown claimed was immediately restored, and the conduct of the lawyer universally admired and applauded. Indeed it brought so great an addition to his fame that the king would no longer be induced to dispense with his services. He made him master of the requests, conferred on him the honour of knighthood soon after, and appointed him one of his privy council.

It was a custom with the king, says the author of the “British Antiquities,” after he had performed his devotions upon holy days, to send for Sir Thomas

More into his closet, and there confer with him about astronomy, geometry, divinity, and other parts of learning, as well as affairs of state. Upon other occasions the king would carry him in the night up on the leads at the top of the palace, to be instructed in the variety, course, and motions of the heavenly bodies. But this was not the only use the king made of his new servant. He soon found that he possessed a great fund of wit and humour; and therefore, his majesty would frequently order him to be sent for to make him and the queen merry at supper. When Sir Thomas perceived that they were so much entertained with his conversation that he could not once in a month get leave to spend an evening with his wife and children whom he loved, nor be absent from court two days together without being sent for by the king, he grew very uneasy at this restraint of his liberty; and so beginning, by little and little, to disuse himself from his former mirth, and somewhat to dissemble his natural temper, he was not so ordinarily called for upon these occasions of merriment. The treasurer of the exchequer dying in 1520, the king conferred this office on Sir Thomas More; and within three years after, a parliament being summoned in order to raise money for a war with France, he was elected speaker of the house of commons. During the sessions Cardinal Wolsey was much offended with the members of the house of commons, because nothing was said or done there but it was immediately made public: on the other hand, the members had an undoubted right, as they thought, to repeat to their friends without doors what had passed within. It happened, however, that a considerable subsidy having been demanded by the king, which Wolsey thought would meet with great opposition in the lower house, he was determined to be present when the motion should be made in order to prevent its being rejected. The house being apprized of his resolution, it was a long while under debate, as to whether it was best to receive him with a few of his lords only or with his whole train. The major part of the house inclined to the first; upon which the speaker got up and said, “Gentlemen, forasmuch as my lord cardinal hath, not long since, laid to our charge the lightness of our tongues, it shall not, in my judgment, be amiss to receive him with all his people; that so, if he blame us hereafter for things spoken out of the house, we may lay it upon those that his grace shall bring with him.” The humour of the speaker’s motion being approved, the cardinal was received accordingly. But having shown in a solemn speech, how necessary it was for the king’s affairs, that the subsidies moved for should be granted, and finding that no member made any answer, nor showed the least inclination to comply with what he asked, he with great indignation said, “Gentlemen, unless it be the manner of your house to express your minds in such cases by your speaker, here is, without doubt, a surprising obstinate silence.” He then required the speaker to give him an answer to the demand which he made in the king’s name. Upon which Sir Thomas, with great reverence, excused their silence, as being abashed at the presence of so exalted a personage. He then proceeded to show, “that it was not agreeable to the ancient liberty of the house, to make an answer to his majesty’s messages by any other person, how great soever, than some of their own members;” and in the conclusion

he told his eminence, "That though, as speaker, he was the voice of the commons, yet except every one of them could put their several judgments in his head, he alone, in so weighty a manner, was not able to make a sufficient answer." The cardinal took offence at the speaker for this evasive reply, and suddenly rose and departed. In consequence of this Wolsey persuaded the king to name him ambassador to Spain. However, when his majesty mentioned his design to Sir Thomas, the knight took the liberty to remonstrate so strongly, yet so modestly, against it on account of the climate, that with a candour and condescension not usual to him, Henry was pleased to admit of his argument, and employed him another way. Accordingly, upon the death of Sir R. Wingfield, in the year 1528 Sir Thomas More was appointed chancellor of the duchy of Lancaster, and at the same time admitted into such a high degree of favour with the king, that his majesty would frequently come, without giving him any notice, to his house at Chelsea, in order to enjoy his society without restraint. The house in which Sir Thomas resided at this period is delineated beneath.

It is remarkable that of all the servants and favourites of Henry VIII. he never treated any with so much good humour as Sir Thomas More. The answer which he made the king on his desiring his judgment with regard to his marriage with Queen Catherine does honour to his memory. Clark and Tonstal, bishops of Bath and Durham, with others of the privy council, having been ordered to consult with him, "To be plain with your grace," said Sir Thomas, "neither my lord of Durham, nor my lord of Bath, nor myself, nor any of your privy council, being all your servants, and greatly indebted to your goodness, are in my judgment proper counsellors for your grace upon this point; but, if you please to understand the very truth, you may have such counsellors who, neither for respect of their own worldly profit, nor for fear of your princely authority, will deceive you;" and he then named Jerome, Austin, and several other ancient fathers, producing the opinions he had collected out of them. When Sir Thomas More was made lord chancellor, his father, Sir John, was one of the oldest judges in the king's bench; and it was a very interesting sight in Westminster Hall to see two such great seats filled by a father and son at the same time. There was another, however, still more surprising; for, if the court of king's bench was sitting when the chancellor came into the hall, he went first into that court, and there, kneeling down in the sight of every

body, asked his father's blessing: and when they happened to meet together at the readings in Lincoln's Inn, he always offered the presidency to his father, though, on account of his son's high dignity, Sir John as constantly waved it. Though living much at court, yet Sir Thomas More, besides his private prayers, always read the psalms and litany with his wife and children in a morning, and every night went with his whole family to chapel, and there read the psalms and collects with them.

It has been asserted by many historians, that Henry gave the great seal to Sir Thomas More purely with a view of engaging the opinion of a man so eminent for piety and learning in favour of his divorce from Queen Catherine: for he thought, after bestowing on him such a high post, Sir Thomas could not with decency refuse it. But if these were really the king's sentiments, he knew very little of Sir Thomas's real opinion. Sir Thomas always vowed that he thought the marriage lawful in the sight of God, since it had once received the sanction of the apostolic council; for, though he stood the foremost among those who were for abolishing the illegal jurisdiction which the popes exercised in England, he was far from wishing a total rupture with the see of Rome, which he plainly perceived was unavoidable, according to the measures that King Henry was then pursuing. All these things considered, Sir Thomas, knowing he must be engaged in the contest on account of his office, by which means he must either offend his conscience or disoblige the king, never ceased soliciting his great and intimate friend, the duke of Norfolk, to intercede with his majesty, that he might deliver up the seal, for which, through many infirmities of body, he said he was no longer fit; and being pressed so often by him to this purpose, the duke at length applied to the king, and obtained permission that the chancellor might resign. But when he waited on Henry for that purpose, the monarch, notwithstanding what he called Sir Thomas's obstinacy with regard to this great affair, expressed much unwillingness to part with so useful a servant; and, giving him many thanks and commendations for his excellent execution of a most important trust, assured him, that, in any request he should have occasion to make, which concerned either his interest or his honour, he should always find the crown ready to assist him. As Sir Thomas More had sustained the office of lord high chancellor for above two years and a half with the utmost wisdom and integrity, so he retired from it with an unparalleled greatness of mind, not being able to defray the necessary expences of his private family when he had divested himself of that employment. When he delivered up the great seal he wrote an apology for himself, in which he declared to the public, that all the revenues and pensions he had by his father, his wife, or his own purchase, except the manors given him by the king, did not amount to the value of fifty pounds a year.

The coronation of Anne Boleyn being fixed for the 31st of May, 1533, Sir Thomas More was invited to be present at the ceremony; but this he declined, as he still retained his opinion as to the illegality of the king's divorce from Queen Catherine. This refusal exasperated the king so much that in the ensuing parliament a bill was brought into the house of lords, attainting him, with several others, for countenancing and encouraging Elizabeth Barton, a pretended prophetess, styled, "The Holy Maid of Kent." This

woman affirmed, that she had revelations from God, to give the king warning of his wicked life, and the abuse of the authority committed to him. In a journey to the Nuns of Sion, she called on Sir Thomas More, and declaring her pretended revelations to him, he was brought in, by the king's direction, as an accomplice with her. He justified himself, however, as to all the intercourse he had with her in several letters to Secretary Cromwell; in which he said, he was convinced she was the most false dissembling hypocrite that had ever been known. But this availed him but little, for when Sir Thomas desired to be admitted into the house of commons to make his own defence against the bill, his majesty would not consent to it, but assigned a committee of the council to hear him. The wish of the king was to prevail on him to give a public assent to the king's measure; to which purpose the lord chancellor Audley stated how great was his majesty's extraordinary love and favour to Sir Thomas. But after assuring the committee of the just sense he had of the king's goodness to him, he told them "that he had hoped he should never have heard any more of that business, since he had from the beginning informed his majesty of his sentiments with regard to it; and the king accepted them not ungraciously, promising that he should never be molested farther about it. However, he had found nothing, since the first agitation of the matter, to persuade him to change his mind; if he had, it would have given him a great deal of pleasure." Then the lords proceeded to threaten him, telling him it was his majesty's commands they should inform him that he was the most ungrateful and traitorous subject in the world; adding, that he had been the means of his majesty's publishing a book, in which he had put a sword in the pope's hand to fight against himself. This was Henry's celebrated book against Luther; but Sir Thomas clearing himself of this charge also, and protesting he had always found fault with those parts of the book which were calculated to raise the power of the pope, and that he had objected against them to his majesty, the lords, not being able to make any reply to his vindication, broke up the committee. Mr. Roper, seeing Sir Thomas extremely cheerful at his return, asked him if his name was struck out of the bill of attainder, that he was in such good spirits. "I had forgotten that," said the knight, "but, if you would know the reason of my mirth, it is, that I have given the devil so foul a fall to-day, and gone so far with these lords, that, without great shame indeed, I can never go back." The duke of Norfolk and Cromwell had used their influence to dissuade the king from proceeding on the bill of attainder; assuring him that they found the upper house were fully determined to hear him in his own defence before they would pass it; and, if his name were not struck out, it was much to be apprehended that the bill would be rejected. But the king was too vindictive to forgive a man who had been his favourite, and yet had dared to offend him; he said that he would be present himself in the house when the bill should pass. The committee of the council, however, differed from him; and finding that nothing else would moderate the obstinacy and vehemence with which he pursued his point, they fell on their knees, and besought him to forbear; telling him "that if it should be carried against him, in his own presence, as they believed it would be, it would encourage his subjects, to despise him,

and be a dishonour to him also all over Europe. They did not doubt but they should be able to find out something else against Sir Thomas, wherein they might serve his majesty with some success; but in this affair of the Nun he was universally accounted so innocent that the world thought him worthier of praise than of reproof." With these suggestions, they at last subdued the king; and the name of Sir Thomas More was struck out of the bill.

In a short time after the breaking up of the parliament, there was a committee of the cabinet-council at Lambeth, consisting of the archbishop, the lord-chancellor Audley, and Cromwell; where several ecclesiastics, but no other layman besides Sir Thomas More, were cited to appear, and take the oath of succession. Sir Thomas being first called, and the oath tendered to him under the great seal, he desired to see the act of succession which enjoined it; and this being also showed him, he said "that he would blame neither those who had made the act, nor those who had taken the oath; but, for his own part, though he was willing to swear to the succession in a form of his own drawing, yet the oath which was offered was so worded that his conscience revolted against it, and he could not take it with safety to his soul." He offered, however, to swear to the succession of the crown in the issue of the king's present marriage, because he thought the parliament had a right to determine that matter. Cromwell, who knew the consequence of this debate, when he saw that Sir Thomas could not be prevailed on to take the oath as it was tendered, saw that his ruin was inevitable; and protested "that he had rather his only son should have lost his head than that Sir Thomas More should have refused to swear to the succession." He was immediately committed to the custody of the abbot of Westminster for four days; during which the king and his council deliberated what course it was best to take with him. Several methods were proposed, but Henry would listen to none of them; and, in the end, Sir Thomas More was committed prisoner to the Tower.

His misfortunes made so little impression upon his spirits that he retained his usual mirth. The lieutenant of the Tower had been formerly under some obligation to him, and therefore apologized to him that he could not accommodate him as he wished, without incurring the king's displeasure; to which he replied, "Master lieutenant, whenever I find fault with the entertainment you provide for me, do you turn me out of doors." When Sir Thomas had been confined about a month, his favourite daughter was allowed to visit him, and afterwards his wife. As she had not the magnanimity of her husband, she remonstrated with him with much petulance, "that he, who had been always reputed so wise a man, should now so play the fool, as to be content to be shut up in a close filthy prison with rats and mice, when he might enjoy his liberty and the king's favour, if he would but do as all the bishops and other learned men had done; and as he had a good house to live in, his library, his gallery, his garden, and all other necessities handsome about him, where he might enjoy himself with his wife and children, she could not conceive what he meant by tarrying so quietly in this imprisonment." He heard her very patiently, and then asked her, in his facetious manner, "whether that house was not as nigh to heaven as his own?—that he saw no great cause for so much joy in his

house, and the things about it, which would so soon forget its master,—that, if he were under ground but seven years, and came to it again, he should find those in it who would bid him begone, and tell him it was none of his. Besides, his stay in it was so uncertain, that as he would be but a bad merchant who would put himself in danger to lose eternity for a thousand years, so how much more if he were not sure to enjoy it one day to an end?" Sir Thomas had espoused the cause of Queen Catherine upon a principle of conscience, and therefore he always withstood Henry upon that point with firmness. The affair of the king's supremacy was no less a matter of conscience to him than the other; but, as the statute which enacted it had made it treason to write or speak against it, he observed a silence in this respect, conformable to the law; but he refused to acknowledge it with an oath. Sir Thomas was tried by the lord chancellor, and a committee of the lords, with some of the judges, at the bar of the king's bench. When the attorney-general had gone through the charge against him in the indictment, in the most virulent manner the lord chancellor said to him, "You see now how grievously you have offended his majesty; nevertheless, he is so merciful, that, if you will but leave your obstinacy and change your opinion, we hope you may yet obtain pardon of his highness for what is past." To this he replied, "that he had much cause to thank these noble lords for this courtesy; but he besought Almighty God, that, through his grace, he might continue in the mind he was then in unto death." After this he went through his defence upon every part of the indictment with great strength of argument and powerful eloquence.

But, unhappily for Sir Thomas, he lived in the days of Henry VIII., whose will was a law to judges as well as juries. Notwithstanding, therefore, the evidence against him was proved notoriously false, yet the jury, to their eternal reproach, found him guilty. They had no sooner brought in their verdict, than the lord chancellor Audley, as the organ of the court, began immediately to pronounce the sentence; but the prisoner stopped him short with this modest rebuke: "My lord, when I was towards the law, the manner in such cases was, to ask the prisoner, before sentence, whether he could give any reason why judgment should not proceed against him." Upon this, the chancellor asked Sir Thomas what he was able to allege. But if a jury could not be moved by what he had said in defending himself against the charge in this indictment, there could be little hope that judges would be influenced to wave their sentence by what he should say against the matter of the indictment itself. However, whether the exceptions he made were too strong to be answered, or whether the chancellor began at this time to feel some little compunction, or had reason to be afraid of the popular clamour if he took the condemnation of the prisoner entirely upon himself, after Sir Thomas had done speaking he turned to the lord chief justice, and asked him his opinion openly before the court as to the validity of the indictment. The answer of the chief justice, whose name was Fitz-James, is somewhat remarkable: "My lords all, by St. Gillian, I must needs confess that if the act of parliament be not unlawful, then in my conscience the indictment is not insufficient." Upon this equivocal expression, the lord chancellor said to the rest,

"Lo, my lords; lo, you hear what my lord chief justice saith;" and, without waiting for any reply, proceeded to pass sentence, "That Sir Thomas More should be carried back to the Tower of London, and from thence be drawn on a hurdle through the city to Tyburn, there to be hanged till he was half-dead; after that, cut down, yet alive, his private parts cut off, his belly ripped, his bowels burnt, his four quarters set up over the four gates of the city, and his head upon London bridge."

"This shocking sentence filled the eyes of many with tears, and their hearts with horror. Then the court telling Sir Thomas, that, if he had any thing farther to say, they were ready to hear him, he addressed himself to the court in the most firm and collected manner:—"I have nothing," said he, "farther to say, my lords, but that like as the blessed apostle St. Paul was present, and consented to the death of Stephen, and kept their clothes who stoned him to death, and yet be they now both twain holy saints in heaven, and shall continue there friends for ever; so I verily trust, and shall therefore right heartily pray, that though your lordships have now been judges on earth to my condemnation, we may yet hereafter all meet together in heaven, to our everlasting salvation: and so I pray God preserve you all, and especially my sovereign lord the king, and send him faithful counsellors."

Having taken his leave of the court in this noble manner, he was conducted from the bar to the Tower, with the axe carried before him in the usual manner after condemnation. But, when he came to the Tower wharf, his favourite daughter, Mrs. Margaret Roper, thinking this would be the last opportunity she should ever have, was waiting there to see him. As soon as he appeared she burst through the throng and guard which surrounded him, and, having received his blessing upon her knees, she embraced him eagerly before the multitude; but the only words that she could utter were, "My father! oh my father!" If any thing could have shaken his fortitude, it must have been this: but he only took her up in his arms, and told her, "That whatsoever he should suffer, though he was innocent, yet it was not without the will of God, to whose blessed pleasure she should conform her own will; that she knew well enough all the secrets of his heart, and that she must be patient for her loss."

We have already seen that Sir Thomas was condemned to be hung, drawn, and quartered, and his head to be stuck on a pole on London bridge. But this ignominious sentence was changed into that of mere beheading, which was executed, July 6th, 1535, on Tower Hill. As he passed along to the place of execution, the feelings of the spectators were expressed by silence and tears. That gaiety of spirit and innocent cheerfulness which were so conspicuous in his life did not forsake him in his last moments. If it be said that he displayed too much lightness for the occasion, we must remember that what was a mournful solemnity to the spectators was to him a matter of joy; and Addison says, "What was philosophy in this extraordinary man, would be frenzy in one who does not resemble him as well in the cheerfulness of his temper as in the sanctity of his life and manners." His body was buried in Chelsea church; his head, owing to the dutiful care of his bereaved daughter Margaret, was placed in a vault in St. Dunstan's church, Canterbury.

More is justly regarded as one of the great promoters of classical learning in this island. His intimate acquaintance with Erasmus and other continental scholars both led him to cultivate his own taste and made him eager to improve that of his countrymen. How much his exertions were wanted, and how low the state of literature was at that period, appears from the well-known fact that the university of Oxford was divided between the contending parties of Greek and Trojan; the one urging, the other vehemently opposing, the introduction of Greek as a part of academical study. More took a very active part against the Trojans, and thus paved the way for that profound and accurate acquaintance with this noble language which still so honourably distinguishes English scholars. He condescended even to smooth the first entrance into learning by assisting the grammatical labours of his friend Lilly. His own English productions are very voluminous; but with the exception of "The Life of Picus of Mirandula," a youthful production, and "The History of Richard III," the genuineness of which is somewhat doubtful, they contain scarcely any thing of consequence. Of his Latin works, by far the best is the "Utopia." Upon it indeed rests all More's fame as an author. This production, so much more talked of than read, is comprised in two books; the first of which, though short and merely introductory, is the best written and most interesting. It consists of a conversation between More and Hythlodæus, the stranger who is just returned from Utopia; in the course of which he introduces many remarks on the political institutions he had seen in his travels, particularly in England. These remarks are equally valuable for their freedom and acuteness, considering the period at which they were written. Princes are arraigned for their love of war, courtiers for their servility and hatred of innovation, and the whole body of the nobles for their idleness and profligacy. He points out very clearly the absurdity of many of our customs and laws, and inveighs bitterly against the sanguinary spirit of our penal code in the punishment of robbery and theft.

By far the most engaging view of More's character is in the relations of private life. It is seldom we are enabled to contemplate statesmen with their minds unbent from exertion; and the admiration which their public exhibitions had raised is not always increased by a closer inspection. But of More's domestic life we have ample details; and it is the contrast of his great elevation and profound knowledge with his tenderness of affection, and his playfulness, simplicity, and unaffected serenity of temper, which forms the true sublime of his character. In him there is no disguise of artificial representation, no management of conduct to produce effect: every act flows without effort from the even tenour of a mind well poised on itself, which nothing external can either elevate or depress. We do not follow him from the speaker's chair or the woollen sack to see him put off the robes of greatness and resume the man; but we go with him from the bosom of his family to see him retain, in those dignified seats, all the childlike simplicity and unaffected lowliness of his nature.

We have already stated that he was twice married. His first wife lived only long enough to produce him all the family he ever had—three daughters and a son; and he seems to have been directed in his second choice by a wish to provide for them a faithful and economical stepmother. She was, as More himself

says, *nec bella, nec puella*; and the badness of her temper often tried, without altering, the sweetness of her husband's. The following letter to her is so illustrative of his equanimity and mild benevolence, and so good a specimen of his English style, that we give it to the reader without abridgment. It was written immediately after his return from assisting at the negotiations at Cambray, and was meant to comfort his penurious wife for a fire which had consumed part of his house, all his barns, and some of those of his neighbours.

"Mistress Alice, in my most heartywise I recommend me to you. And whereas I am informed by my son Heron of the loss of our barns, and our neighbours' also, with all the corn that was therein; albeit (saying God's pleasure) it is great pity of so much good corn lost; yet, since it has liked him to send us such a chance, we must, and are bounden, not only to be content, but also to be glad of his visitation. He sent us all that we have lost; and since he hath by such a chance taken it away again, his pleasure be fulfilled! Let us never grudge thereat, but take it in good worth, and heartily thank him as well for adversity as for prosperity. And peradventure we have more cause to thank him for our loss than for our winning; for his wisdom better seeth what is good for us than we do ourselves. Therefore, I pray you be of good cheer, and take all the household with you to church, and there thank God, both for that he has given us and for that he has taken from us, and for that he hath left us; which, if it please him, he can increase when he will; and if it please him to leave us yet less, at his pleasure be it!

"I pray you to make some good onsearch what my poor neighbours have lost, and bid them take no thought therefore; for if I should not leave myself a spoon, there shall no poor neighbour of mine bear loss by my chance, happened in my house. I pray you be, with my children and your household, merry in God; and devise somewhat with your friends what way were best to take for provision to be made for corn for our household, and for seed this year coming, if we think it good that we keep the ground still in our hands. And whether we think it good that we so shall do or not, yet I think it were not best suddenly thus to leave it all up, and to put away our folk from our farm, till we have somewhat advised us thereon. Howbeit, if we have more now than ye shall need, and which can get them other masters, ye may then discharge us of them. But I would not that any man were suddenly sent away he wot not whither.

"At my coming hither I perceived none other, but that I should tarry still with the king's grace. But now I shall, I think, because of this chance, get leave this next week to come home and see you; and then shall we farther devise together upon all things what order shall be best to take.

"And thus, as heartily fare you well, with all our children, as ye can wish! At Woodstock, the 3rd day of September, by the hand of Thomas More."

To the education of his children he devoted himself with no less ardour than success. They were all brought up, his daughters as well as his son, in the wholesome and invigorating discipline of classical learning; and we should not be sorry to find that the example and authority of so great a man had power to extend the practice at present.

"As I prefer learning, united with virtue, to all the

treasures of princes," says he in a letter to the tutor of his children, "so I look upon the reputation of learning when separated from good morals as merely infamy rendered conspicuous. This applies peculiarly to the female sex. Their proficiency in literature being something new, and a certain reproach to the sluggishness of men, most men will be ready to attack them, and to expend their natural malice upon their learning. Nay, they will call their own ignorance a virtue when compared with the faults of those learned. But, on the other hand, if a woman (which I wish may be the case with all my girls, and in which I have the greatest confidence under your auspices) to great excellence of character unite even a moderate portion of learning, I deem her possessed of more real good than if she had the wealth of Croesus and the beauty of Helen. And this not for the sake of fame, although she pursueth worth as doth the shadow the body; but because the reward of wisdom is more substantial than to be borne away on the wings of riches, or to fade with beauty."

In the same letter are the following hints on the moral education of his daughters:—

"I have not only requested you, my dear Gonerius, whose strong love to all mine would have led you, I know, to have done so of your own accord, not only my wife, to whom her true maternal piety is a sufficient impulse, as I have often witnessed, but I have frequently besought almost all my friends also, that they might afterwards admonish my children, that, avoiding the precipices of pride, they walk on the pleasant meads of modesty; that the sight of riches overcome them not; that they sigh not for the want of that in themselves which is erroneously admired by others; that they think no better of themselves for being well dressed, nor worse for being otherwise; that they spoil not the beauty which nature gave them, by neglect, nor endeavour to increase it by vile arts; that they esteem virtue the first, letters the second good; and that of these they esteem those the best which can best teach them piety to God, charity to man, modesty and Christian humility in their own deportment."

They corresponded to this paternal solicitude as well as a father could wish. His daughter Margaret in particular, who married Roper his biographer, attained such excellence in every branch of elegance and useful learning as to be always mentioned among those whose mental accomplishments have done honour to the sex. Moore often expresses his satisfaction with "the invincible courage" she displays in "joining to her virtue the knowledge of most excellent sciences;" and the pleasure he felt in the progress of all his children is conveyed with great *naïveté* in the following letter "to his whole school."

"You see what a device I have found to save paper, and avoid the labour of writing all your names. But although you are so dear to me, that if I had named one, I must have named all the rest; yet there is no appellation under which you appear dearer to me than that of scholar: the tie of learning seems almost to bind me to you more powerfully than even the tie of nature. I am glad therefore that Mr. Drue is again safely returned to you, as you know I had some reason to be anxious about him. If I did not love you so much, I should envy you the happiness of possessing so many and such excellent masters. I understand Mr. Nicholas is also with you, and that you are, with his assistance, making such

prodigious progress in astronomy, as not only to know the pole-star, and the dog and such common constellations, but even, with a skill which bespeaks truly accomplished astronomer, to be able to distinguish the sun from the moon! Go on then, with this new and wonderful science, by which you ascend to the stars. And while you diligently consider them with your eyes, let this holy season raise your minds also to heaven, lest, while your eyes are lifted up to the skies, your souls should grovel among the brutes. Adieu, my dearest children."

Erasmus draws a very pleasing picture of More's domestic circle in his house at Chelsea, where, in the latter part of his life, he had assembled most of his relations, and lived like a patriarch in the midst of them. The directing power of his superior understanding diffused through the whole establishment the charm of constant occupation, while the matchless felicity of his temper promoted the gaiety of youth and the cheerfulness of social intercourse.

"I would call this house," says Erasmus, "the academy of Plato, were it not injustice to compare it to a place where the usual disputations concerning figures and numbers were only occasionally interspersed with disquisitions about the moral virtues. A house in which every one studies the liberal sciences, where the principal care is virtue and piety, where idleness never appears, where intemperate language is never heard, where regularity and order are prescribed by the mere force of kindness and courtesy, where every one performs his duty, and yet all are so cheerful as if mirth was their only employment—such a house ought rather to be called a practical school of the Christian religion."

More's principles of religious conduct are at times not only discordant with every other part of his character, but often inconsistent with each other, and that to a degree which we can only account for by regarding some of them as the dictates of his own manly and uncorrupted judgment, and others as the effects of early prepossession, and of that zeal against innovation which is so apt to blind the soundest understandings. In the "Utopia," which he wrote in the full vigour of his faculties, Utopus, the legislator of his favourite republic, makes a law that every man shall be of what religion he pleases, not only to preserve the public peace, which had suffered much by daily contentions and irreconcilable sects, but because he thought the interest of religion itself required it.

"He judged it wrong," observes Sir Thomas, "to lay down any thing rashly; and seemed to doubt whether those different forms of religion might not all come from God, who might inspire men in a different manner, and be pleased with the variety. He therefore thought it indecent and foolish for any man to threaten and terrify another, to make him believe what did not strike him as true. And supposing even only one religion to be true, and the rest false, he imagined that the innate force of truth would at last break forth and shine bright, if supported only by the strength of reasoning, and attended to with a gentle and unprejudiced mind; while, on the other hand, if such debates were carried on with violence and tumult, since the most wicked are ever the most obstinate, the best and most holy religion might be choked with superstition, as corn is with briars and thorns."

Sir Thomas More had been accustomed to all the nice distinctions of casuistical divinity; and many

things of course, frivolous enough in themselves, assumed in his mind an importance that did not belong to them. He had not even made up his sentiments on the disputed points put to him by the judges on his trial, which accounts for his declining to declare them openly, either in his examinations or in prison. But when the mind's energy is excited by unjust persecution, resistance becomes a point of honour as well as of conscience; and contempt of death is cherished, not less by a hatred of oppression than by a feeling of rectitude. Both motives, we believe, actuated More's conduct; though the whole tenour of his life leaves no room to doubt that the latter was infinitely the more powerful. In all his expressions, indeed, with regard to Henry after his condemnation, there is what in any man but him we should call an excess of meekness, a kissing of the rod, a want almost of the dignity and independence of conscious integrity. This impression, however, is probably owing to the fervent indignation against the tyrant which rises in the breast of every reader of his history, but to which, as well as to every other turbulent emotion, More's nature and principles were equally averse. Never, certainly, was the mind of man less discomposed by the sentence of condemnation and the approach of death. They produced no shock of the system, no revulsion of feeling, no screwing up of the courage, to meet a great occasion. "His death," as Addison observes, "was of a piece with his life. There was nothing in it new, forced, or affected: nor did he look upon the severing of his head from his body as a circumstance that ought to produce any change in the disposition of his mind."

MOREAU, JEAN VICTOR, one of the oldest and most celebrated generals of the French republic. He was born at Morlaix in Bretagne in 1763. His father destined him for the law, but, led by his decided predilection for the military profession, he fled from his studies, and enlisted in a regiment before he had attained his eighteenth year. He was not, however, suffered to indulge his ruling passion, but was obliged to apply himself anew to the study of law at Rennes, of which school he became provost. When the revolution broke out he had acquired considerable reputation, and in 1780, a general confederacy of the Bretons being formed at Poitiers, he was chosen its president, and also became commander of the first battalion of volunteers raised in the department of Morbihan, at the head of which he joined the army of the north. He subsequently favoured the party of the Gironde, the fall of which much affected him, and it was with great repugnance that he accepted the constitution of 1793 when formally presented to the army.

In the mean time he much distinguished himself at the head of his battalion, and Pichegru, under whom he served, did all he could to befriend him. The same year he was made general of brigade, and in 1794 general of division, and was entrusted with a separate force to act in maritime Flanders, where he took many towns. He also had a share in the memorable winter campaign of 1794, in which he commanded the right wing of Pichegru's army. He was soon after named commander-in-chief of the army of the Rhine, and commenced that course of arduous operations which terminated in the celebrated retreat from the extremity of Germany to the French frontier in the face of a superior army, by which his skill as a consummate tactician was so much exalted. Meantime the republic was torn with intestine divisions, and a

conspiracy was entered into by Pichegru, which it was the fortune of Moreau to discover by a correspondence which accidentally fell into his possession. After struggling for some time with his friendship for his old commander, he finally gave up those documents to the directory; but the evident reluctance with which he took this step excited suspicions at Paris, and, finding that he could not explain himself satisfactorily, he begged leave to retire, which was granted. His talents as a general again brought him forward, and in 1798 he was sent to command the army of Italy, where, after some brilliant successes, he was obliged to give way to the Russian force under Suwarrow, and he managed another retreat with great skill. On quitting the command in Italy for that on the Rhine he visited Paris, where he received some propositions to strengthen the party of the declining directory, to which he would not accede. On the return of Bonaparte from Egypt he at first cordially supported him, but a coldness and jealousy ensued; notwithstanding which the latter, as first consul, entrusted him with the command of the armies of the Danube and the Rhine. The passage of these rivers, with the battles of Möskirch, Engen, Memmingen, Biberach, Hochstädt, Nördingen, and others followed, ending with the decisive victory of Hohenlinden, which induced the Austrians to ask for peace.

On his return to Paris he was received by the first consul with the most flattering attention, and he soon after contracted an alliance with a young lady of birth and fortune, whose ambition, with that of her connexions, is supposed to have fomented the discontent which soon after induced him to retire to his estate at Grosbois. He was finally accused of participation in the conspiracy of Pichegru and Georges, was brought to trial with fifty-four other persons, declared guilty upon slight evidence, and sentenced to two years' imprisonment, and to bear the expenses of the suit. He was, however, allowed to travel in lieu of imprisonment, and to seek an asylum in the United States of America on condition that he would not return to France without permission from the government. He accordingly embarked at Cadiz in 1805, and safely reached America, where he bought a fine estate near Morrisville on the Delaware. Here he remained some years in peace, until, listening to the

invitation of the allies, and more especially of Russia, he embarked for Europe in July of that year, and, reaching Gottenburg, proceeded to Prague. Here he found the emperors of Austria and Russia, with the king of Prussia, all of whom received him with great cordiality, and he was induced to aid in the direction of the allied armies against his own country. It was a fatal resolution to himself, for, on the 27th of August, soon after his arrival, while conversing with the emperor Alexander on horseback in the battle before Dresden, a cannon ball fractured his right knee and leg, and carried away the calf of the left, so as to render the amputation of both necessary. After languishing five days he expired on the 1st of September, 1813. He was buried at St. Petersburg, and the emperor of Russia made an ample provision for his widow, who also received the title of *maréchale* from Louis XVIII. The manners of Moreau were simple, and he was humane and generous as well as brave. His great merits as a soldier all parties admit, but much of his personal conduct as a partisan, and especially that which led to the termination of his life, will be judged of variously by persons of different political opinions.

MOREAU, JEAN MICHÉL, was the elder brother of Jean Victor Moreau. He was born at Paris in 1741, and became a scholar of Lelorrain, whom he accompanied to St. Petersburg when he was chosen director of the academy of arts in that city. Moreau went with him as assistant, though he was then but seventeen years of age. Two years after this Lelorrain died, and Moreau returned to Paris. Being entirely without pecuniary means, he abandoned painting, and under Lehas devoted himself to the study of engraving; and as he drew with skill, he prepared the designs for his plates himself. Moreau quickly established his fame. He prepared engravings for the works of Homer, Thucydides, Marcus Aurelius, Virgil, Juvenal, Ovid, Corneille, Racine, Lafontaine, Regnard, Crébillon, Rousseau, Montesquieu, Marmontel, Raynal, Mably, Gresset, Barthélemy, Saint Pierre, Voltaire, and Molière, to each of the two latter two different series of engravings (making together more than 100 plates); also sixty plates for Gesner's writings, eighty for the New Testament, and 160 for "The History of France." The great variety of these subjects prove his extensive information, and Moreau might be considered as a living encyclopædia of arts.

In 1770 he was commissioned to prepare all the drawings required for the public festivities and those of the court, and he commenced his duties with the sketches for the celebration of the nuptials of the dauphin and the other princes. In 1775 he published engravings, executed by himself, of his drawings for the coronation of Louis XVI., and was made member of the academy of painting, and draughtsman of the royal cabinet. His activity is shown by the number of his productions, for, besides what he completed as royal draughtsman, the number of drawings which he executed for engravings amounts to 2400. In 1784 he made a visit to Italy, which forms an epoch in his opinions and productions. All his works after that period are freer and nobler. As late as 1810 he enriched the exhibition of works of art with two drawings, each of which contained more than 300 figures. His disinterestedness prevented him from accumulating property, and he died at Paris in 1814, in comparative poverty.

MORELL, THOMAS, an eminent writer on phi-

lology and criticism in the last century. He was a native of Eton, and received his education in the college there as a scholar on the foundation. He removed to King's college, Cambridge, of which he was chosen a fellow, and in 1743 took the degree of D. D., and entered into holy orders. His death took place in 1784, at the age of eighty. Dr. Morell republished, with improvements, King's edition of four of the tragedies of Euripides, and published an edition of the "Prometheus Vincit" of Æschylus, a "Lexicon of Greek Prosody," and a translation of the "Epistles of Seneca," with notes; selected the words for some of Handel's oratorios, and assisted in a modernized version of "The Canterbury Tales" of Chaucer.

MORELLET, ANDREW, ABBE, a celebrated member of the French academy, who was born at Lyons in March 1727, and educated in the seminary of the 'Thirty-three. His industry, regularity, and good conduct, obtained him admission into the institute of the Sorbonne, where he passed five years entirely devoted to study. He then accompanied a young nobleman to the college of Du Plessis, and afterwards on a tour to Italy in the capacity of tutor. While at Rome in 1758 he made an abstract of Eymeric's "Directorium Inquisitorum," which was published four years later under the title of "Manuel des Inquisiteurs." On his return to Paris in 1759, Morellet was admitted into the distinguished circle of Mad. Geoffrin, and having published a satirical piece in answer to Palissot's tragedy of "The Philosopher," entitled "Préface des Philosophes," in which he made an offensive allusion to the princess de Robecq, he was confined in the Bastille. In 1766 he published a translation of "Beccaria on Crimes and Punishments," and in 1769 issued a "Prospectus d'un Nouveau Dictionnaire de Commerce," on which he was employed twenty years, and which was suspended by the revolution. In 1772 he came to England, where he became acquainted with Franklin and other distinguished individuals, and in 1783 his services were required in the negotiations for peace between this country and France, and were rewarded by a pension of 4000 livres. On the outbreak of the revolution he published several pamphlets on political subjects, opposed the abolition of the academy, though without success, but succeeded in saving its archives from destruction. His "Cries des Familles," in defence of the rights of the children of those who perished in the time of terror, and his "Cause des Pères," in favour of the emigrants, while they hazarded his safety, gained the esteem of the good. The loss of his pension at this time obliged him to undertake the translation of several works, novels, travels, &c., from the English. On the establishment of the institute he was passed over, but in 1803 was admitted into the *académie*. A fall, which broke his leg, in 1815, at the age of eighty-eight, did not diminish his literary activity, and his last years were occupied with the "Mélanges de Littérature et de Philosophie du Dix-huitième Siècle." He died in 1819.

MORELLI, GIACOMO, the celebrated librarian of St. Mark's, was born at Venice in 1745, of poor parents, and received an imperfect education, the defects of which he endeavoured to supply by his personal exertions. His frequent visits to the Zenian library and the nature of his studies attracted the notice of the librarian Rubeis, who was so much pleased with his zeal and intelligence as to aid him in his pursuits. He visited the other libraries in the

city and neighbourhood, copying, making extracts, taking notes, and compiling catalogues. He acquired a knowledge of Greek and afterwards of French, and soon became known for his learning and industry. His "*Bibliotheca Manoscritta del Bali T. G. Farsetti*," and his "*Dissertazione Storica intorno alla Publica Libreria di S-Marco*," and his "*Codd. Mss. Lat. Bib. Naniæ relati cum Opusculis Ineditis ex iisdem depromptis*," had already made him favourably known abroad, when in 1778 he succeeded Zanetti as librarian of St. Mark's. During forty-one years he lived only for this library, which he increased by several valuable collections obtained from his friends and from public offices, and to the stores of which he gave new value by his arrangement of them. It is impossible to paint his grief when he was obliged to surrender some of the books to the French; and when the order for removing the library to the ducal palace was communicated to him he burst into tears and fainted away. Morelli compiled a catalogue of the Pinellian library, which he had himself arranged, in six volumes octavo. His editions of "*Aristides against Leptine*," Libanius's "*Defence of Socrates*," Aristoxenos's "*Rhythmica Elementa*," and his "*Epistolæ Septem Variæ Eruditionis*," and particularly his "*Bibliotheca Manuscripta*," with numerous other works of a critical, biographical, and antiquarian nature, are monuments of profound learning, acute criticism, and unwearied industry. He died in 1819.

MORERI, LOUIS, a French ecclesiastic and biographical writer, who was born in Provence in 1643, and received his education among the Jesuits at Aix. On entering into holy orders he became almoner to the bishop of Apt. That prelate having formed the plan of a universal historical dictionary, caused researches for materials to be made in various countries, and particularly in the Vatican library at Rome. Not choosing to let the work appear in his own name, he transferred his collections to Moreri, by whom they were arranged and prepared for the press. He published his "*Dictionnaire Historique*" at Lyons in 1674, in one volume folio; and a second edition enlarged to two volumes appeared in 1681. Moreri died in the course of the preceding year, the voluminous compilation to which his labours gave birth having been variously augmented by Le Clerc and other writers of talent.

MORETO Y CABANA, AUGUSTIN, an eminent Spanish dramatic poet, who lived in the reign of Philip IV., of whose life nothing is known except that he wrote plays, sometimes in connexion with other writers, and sometimes by himself, but afterwards entered a religious house and renounced poetry. In comedy many prefer him to Calderon, although they blame the defects of his plots and his incorrect style. Some of his plays are entirely comic and distinguished for character, although in the form of the Spanish comedies of intrigue. His comedy "*De fuera vendra, quien de Casa nos echara*" contains several characters drawn with much humour and comic power. His "*Grazioso*" (the clown or buffoon of the *comedas de capa y espada*) too often utters stale jests. His "*El Desden con el Desden*," one of the most popular Spanish comedies, has been imitated in other languages. His "*No puede ser*" was also brought upon the French stage by Dumaniant in the "*Guerre Ouverte*," and imitated by Molière, in his "*Ecole des Maris*."

MORGAGNI, GIAMBATTISTA, one of the most learned physicians and anatomists of Italy. He was born at Forlì, in the States of the Church, in 1682, and studied at Bologna, where the celebrated Valsalva was his friend and teacher, and soon became so distinguished in natural philosophy, medicine, and also astronomy, that he was able to assist his master in his lectures. But he devoted himself more particularly to the study of anatomy, and in his twenty-fourth year composed some important and valuable essays on anatomical subjects. After passing several years in his native city as a practising physician, he became in 1712 professor of medicine in Padua. His fame as an anatomist was extended throughout Europe, and procured him admittance to the principal academies. Among his numerous writings are his "*Adversaria Anatomica Omnia*." The Leyden edition of 1741 contains also "*Nova Institutionum Medicarum Idea*," "*Epistolæ Anatomicæ*," "*De Sedibus et Causis Morborum*." He died in 1771.

MORGAN, DANIEL, one of the most distinguished officers of the American army in the revolutionary war, who was born in New Jersey, whence he removed to Virginia in the year 1755. Being extremely indigent, he was compelled to drive a waggon for subsistence, and by a rigid economy he amassed money to purchase a team, and continued in this humble occupation until the time of Braddock's expedition, in which he enlisted. During the campaign he received a wound in the face which left an indelible scar. On a charge of contumacy to a British officer he was punished with 500 lashes,—a circumstance which is mentioned because, in the revolutionary war, many English officers fell into his hands, whom he treated with invariable mildness and generosity. Between the ages of twenty and thirty Morgan was much addicted to gambling and pugilistic combats. He retained the bold spirit which he manifested in this interval, but in the later stages of his life was ashamed of his early excesses. Having returned home after Braddock's defeat, he resumed his old employment as a waggoner and his habits of frugality, and thus acquired means to purchase a small piece of ground, upon which he erected a house. At the commencement of the revolutionary war he was appointed to the command of a troop of horse raised in his neighbourhood, and with this he marched to join the American army at Boston, whence he was detached by Washington in the memorable expedition against Quebec. No officer distinguished himself on this occasion more than Morgan. When Arnold was wounded in the assault on the city, and carried from the field, Morgan took the lead. Seconded by his gallant followers he passed the first barrier and mounted the second; but the death of Montgomery, the strength of the British, and the blinding tempest which raged at the moment, rendered all exertion vain. Morgan was among the prisoners of war, and indignantly rejected an offer of the rank and pay of a colonel in the British service.

On the exchange of prisoners which took place soon after, he rejoined the American standard, and was appointed to the command of a rifle corps, with which he was detached to the assistance of General Gates, and contributed materially to the triumph obtained over General Burgoyne. After his return to the main army he was constantly employed by Washington in the most perilous enterprises, and always acquitted himself admirably. In 1780, o

to the decline of his health, he retired into private life; but, being appointed a brigadier-general by brevet, he consented to accompany General Gates when the latter was called to the chief command of the army in the south. Morgan did not, however, arrive until after the disastrous affair of Camden. At the Cowpens he commanded the American force by which Tarleton was routed. The details and effects of this brilliant victory cannot be given here, but the American congress manifested a sense of its importance by presenting a gold medal to Morgan, a sword to Brigadier Pickens, and a silver medal to lieutenant-colonels Howard and Washington. General Greene was now appointed to supersede General Gates in the command of the army of the south. After the battle of Cowpens, Morgan differed in opinion with Greene as to the route to be taken in his retreat. He yielded to the wishes of the commander; but, when the two divisions of the army united at Guilford court-house, he left the service in disgust and devoted himself to the improvement of his farm. This is the common explanation of his secession; but we ought here to note that Johnson, in his life of Major-General Greene, contradicts it. He says, "The real cause of Morgan's disappearing from the stage of the war was, unquestionably, a serious indisposition—ague and rheumatism, contracted during the severe winter campaign. His health had been considerably affected before he crossed the Catawba; but, in the hurried march from that river to the Yadkin, it rained incessantly, and before the army reached Guilford he could no longer withstand the combined attacks of those racking diseases. He was prevented by nothing but continued indisposition from rejoining the army." He re-appeared in the public service when sent at the head of the Virginian militia against the Pennsylvanian insurgents in what is called the whiskey insurrection. He then served one term in congress, as representative of the district of Frederic, in Virginia. He died at Winchester, in that state, in the year 1799. Morgan was a man of much natural ability, but wanting in education and refinement. His stature was lofty and his frame adapted to the severest toils.

**MORGAN, WILLIAM.**—The singular fate of this American has given great notoriety to his name. He was a native of Virginia, but, for some time previous to the autumn of 1826, had been an inhabitant of the western part of the state of New York. As early as the month of August of that year it became generally known that he was engaged in preparing for the press a work by which the obligations and secret proceedings of freemasonry were to be divulged. Some members of the fraternity in and about Batavia, where Morgan then resided, were alarmed, and eventually became much excited, on account of the contemplated publication. Remonstrances and inducements to dissuade him from such a course of conduct were resorted to by his brother masons, but in vain. At length a conspiracy was formed, including in its origin, or at its subsequent stages, no inconsiderable number of persons, for the purpose of separating Morgan from those who had engaged him to undertake, and were encouraging him to go on with, the development of the secrets of the masonic order. Given up to an unaccountable infatuation, they commenced the execution of this ill-advised project by taking him, on the 10th or 11th of September, 1826,

from Batavia, under the pretence of a charge for petit larceny, to Canandaigua. The criminal charge was abandoned, and a civil suit instituted against him. A judgment for a small amount was recovered, and he was committed, by virtue of an execution issued thereon, to the gaol of Ontario county. On the evening of the 12th of September he was discharged by the interference of some of the conspirators, and, as he passed out of the door of the gaol, was seized by them, taken a small distance, and then forcibly put into a carriage. He was carried, in the course of that night, on to the Ridge road, about two miles beyond the village of Rochester. During the next day and night he was taken to Lewiston, a distance of seventy or eighty miles, and from thence to Fort Niagara, at the mouth of the Niagara river. Soon after his abduction it was ascertained, to a reasonable degree of certainty, that he had been taken to Fort Niagara; but for some time an almost impenetrable obscurity seemed to shroud the events subsequent to his arrival at that place. The disclosures which were at length made before grand-juries, and on the various trials of those who were indicted for carrying him off, have in a great measure removed the veil which hid these events, and established, in a satisfactory manner, that his life was in a few days brought to a tragical end. He was secured in the magazine of that fort, which was at that time unoccupied by any of the forces of the United States. Soon after he was brought to that place, those who had him in charge were much embarrassed to devise what to do with him. Consultations were held on the subject, and some of the party proposed to take his life, which they alleged he had forfeited by violating the obligations he had voluntarily taken on himself when he became connected with the masonic fraternity, or in the subsequent stages of his advancement to its higher distinctions; but others protested against such a violent and wicked course. When all the circumstances are considered, and the evidence given on this point is well weighed, they seem to be sufficient to bring any candid mind to the conclusion that this proposition was finally adopted and executed; but it is not fully known who adopted it, or by whose hands it was executed. The number of those directly concerned in the final catastrophe is believed to be small; it is also believed that those who first formed the conspiracy to carry him off, and those who subsequently became connected with it by lending their aid in carrying him to Fort Niagara, did not intend or anticipate the termination to which this affair was brought. Indeed, it is reasonable to conclude that the design upon his life was suggested by the embarrassment which those felt who were called on to make a further disposition of him after his arrival at Fort Niagara.

This outrage upon the liberty of a fellow-citizen, and contempt of the laws of the land, from the protection of which this citizen had been violently taken, roused the indignation of the community in the midst of which the offence was committed. They demanded their fellow-citizen: he was not produced, nor could he be found. They anxiously sought to know his fate, but they long sought in vain. The public excitement increased in intenseness, and spread over a wider region of country. Those who partook of it largely did not stop to discriminate. The single circumstance that any individual had a high standing in the masonic order was sufficient evidence, to their

minds, of his participation in the crime. Finally, the whole fraternity were regarded as in some manner implicated in the transaction. It is believed by some, and perhaps alleged by more, to have been the natural consequence of the discipline of the masonic institution. A current of feeling so strong and so deep was soon turned to political purposes. An anti-masonic party was immediately formed; it predominates in several of the counties in the western part of New York, and has converts in every part of the state, as well as in many other states in the union. This party is numerous, active, well organized, and every where seeking political ascendancy, not only in the several states, but in the general government.

MORGAN, WILLIAM, a distinguished mathematician, who was born in 1750. He was educated at his birth-place in Glamorganshire, and afterwards repaired to London to study medicine. He combined a close attention to practical mathematics with his professional pursuits, and in 1770 his uncle, Dr. Price, published the first edition of his work on "Reversionary Payments, on Schemes for Providing Annuities for Widows and for Persons in Old Age, and on the Method of Calculating the Value of Assurances on Lives." This caused Dr. Price to be consulted by many societies instituted for these purposes, as well as in cases for the valuation of individual reversionary interests; and he suggested to his nephew, that it might possibly be of advantage to him to turn his attention to these subjects. In February 1774 he was, at the recommendation of Dr. Price, appointed to the office of assistant actuary to the equitable society; and succeeded to the more important office of actuary in February 1775, the president and directors of which society had frequently consulted Dr. Price on the management of their affairs.

Here he had an opportunity of following the peculiar bent of his genius, and he pursued his mathematical studies with great ardour and an enthusiastic love of science. It was his constant habit at this time, and for many years afterwards, to rise every morning between four and five o'clock, winter and summer, to pursue his studies. To these he again recurred in the evening; but finding, when he encountered difficulties in his evening studies, that his ardour to surmount them deprived him of rest, he abandoned the study of mathematics in the evening, and devoted those hours either to the study of experimental philosophy (chemistry or electricity, but more particularly the latter), or in reading and abridging the works of the Greek historians. The course of his mathematical studies cannot exactly be traced; but there is every reason to believe that, between the years 1772 and 1776, he had read the *Elements* of Euclid, Simpson and Saunderson's "Algebra," Simpson's "Plane and Spherical Trigonometry," Hamilton and Apollonius's "Conics" (these two works he appears to have collated and compared with great care, by the manuscript notes in the margins of the copies which he read), Rowe's and Simpson's *Fluxions*, and Emerson's "Mechanics."

In the year 1779 he published the first edition of his work on the doctrine of annuities and reversionary payments, containing rules for solving all questions concerning the value of annuities and reversions depending on any one, two, or three lives, or on any survivorships among them, most of which had never before been answered. These solutions were all derived from the hypothesis of De Moivre. In 1781

he published an examination of Dr. Crawford's theory of heat and combustion.

Mr. Morgan's decease took place at Stamford Hill, Middlesex, on the 4th of May, 1833, in the eighty-third year of his age. The following tribute to his memory was offered in the place of worship he had for many years attended, by Mr. Aspland:—"You are nearly all of you aware that this congregation has been recently deprived by death of another of its members, the distinguished head of a much-respected family. And I feel it right to allude publicly to the loss of our lamented brother in Christ, not only on account of his rank and estimation in society and the excellence of his character, but also because he was earlier connected with this congregation than, perhaps, any other person now living, and because his connexion with it was owing to his near relationship to one of its former pastors, a man whose name is an honour to this Christian church, and to have been associated with whom was a distinction ever to be valued. I need not say that I refer to Dr. Price, one of the purest and best of men; a philosopher who had the humility of a child; a writer upon points that commonly inflame the angry passions, who was not more distinguished by the perspicuity and strength of his composition, and the force of his reasoning, than by his candour and charity, and whose whole character seems to have been modelled upon that of his Lord and Saviour. This eminent man—eminent in science, and, I will add, eminent in morals and theology—did not escape the reproach of evil tongues; but posterity is doing him ample justice, and his name will, I doubt not, be lastingly enrolled in the better chapter of the annals of our country, amongst those patriots, philanthropists, and benefactors to their species with whom it was his honour and his delight to be united, and to whom (and to none more than to him) we are indebted for that happy change in the spirit of the people, and those important legislative improvements which are the true glory of the present age.

\* \* \* \* \*

"I need scarcely add in this place that our departed brother was a Christian believer, and attached great importance to the genuine Christianity of the New Testament. His views, I believe, for the most part coincided with those of the honoured relative whom I have named,—views alike honourable to our Creator, worthy of our Saviour, and tending to the improvement and happiness of the human race. He has been called in the maturity of his years to follow them from whom he learned wisdom and virtue; and I cannot utter a better wish for his surviving family, than that they may be followers of him in his beneficial application of his talents to the public good, and in his incorruptible and fearless integrity; or offer a more suitable prayer for you, his remaining fellow-worshippers, than that you may be strengthened in every righteous habit, by seeing in his example a new illustration of the consoling, animating truth, that the memory of the just is blessed."

MORGHEN, RAPHAEL.—This talented engraver was born at Naples in 1758, and is justly reckoned among the first European engravers. He received his early instructions from his father, and was afterwards placed as a pupil under the celebrated Volpato, whom he assisted in engraving the great pictures of Raphael in the galleries of the Vatican. The print which represents the Miracle of Bolsena is inscribed

with his name. After having married the daughter of Volpato, he was invited to Florence in 1782 to engrave the masterpieces of the Florentine gallery. Of the works which he produced on this occasion, his copy of Raphael's *Madonna della Seggiola* is considered the most excellent. The reputation which he acquired by his labours on the Florentine gallery induced the artists of Florence to recommend to the grand-duke to employ him in engraving Leonardo da Vinci's noble composition of the *Last Supper*, which is painted on the wall of the refectory in the Dominicans' convent at Milan. This picture is much dilapidated, and the drawing which was made from it for Morghen was by no means worthy of the original; so that, though the engraver has given to the world an admirable print, he has failed in giving a correct idea of the style and merit of Leonardo. In 1803 he was chosen an associate of the French institute, and in 1812 he was invited to Paris by Napoleon, who treated him with the most flattering kindness. Among the most remarkable of the other numerous works of Morghen, may be noticed the *Transfiguration*, from Raphael; a *Magdalen*, from Murillo; a *Head of the Saviour*, from Da Vinci; the *Car of Aurora*, from Guido; the *Hours*, from Poussin; the *Prize of Diana*, from Domenichino; the *Monument of Clement XIII.*, from Canova; *Theseus Vanquishing the Minotaur*; portraits of Dante, Petrarca, Ariosto, Tasso, &c.

MORHOF, DANIEL GEORGE, a learned philological writer, who was born at Wismar, in the duchy of Mecklenburg, in 1639. He was educated at Stettin and Rostock, where he studied jurisprudence, but in 1660 was chosen professor of poetry at the latter university. Previously to engaging in the duties of his office he travelled for two years in Holland and England. In 1665 he became professor of poetry and rhetoric at Kiel. He visited England and Holland a second time in 1670, when he contracted an intimacy with Boyle, and with several of the Dutch literati. In 1673 he obtained the chair of history at Kiel, and in 1680 was appointed librarian to the university. He died in 1691 at Pyrmont, whither he had gone for the benefit of his health. He was the author of a valuable work, entitled "*Polyhistor Litterarius, Philosophicus, et Practicus*," part of which he published at Lubeck in 1688, and it was reprinted, with additions, in 1695; but the most complete edition is that of 1747.

MORILLO, DON PABLO, a Spanish officer of courage and talent, but bad moral character, who was originally a sergeant of artillery in the marines. During the war carried on by the Spaniards against Napoleon he raised a guerilla corps, at the head of which he soon acquired reputation. His first exploit was his obstinate defence of the bridge *Puente del Conde* in *Estremadura*, and this was soon succeeded by the capture of *Vigo* in *Galicia*, in which he co-operated with the British. On the latter occasion he acted as commander-in-chief of the Spaniards, and was desired by his men to assume the title of colonel, the French governor having hesitated to capitulate to an officer of inferior rank. His colonelcy was confirmed to him by the central junta. He was promoted to be a general in the course of the war, and distinguished himself on several occasions, particularly at the battles of *Vittoria* and *Nivelle*. His activity was such that he gained the appellation of *Wellington's* cossack. In 1815, when the Spanish

government resolved to make a strenuous effort to recover its authority over the South American colonies, Morillo was placed at the head of the expedition, consisting of 12,000 men. While Morillo was preparing to embark his troops, measures were adopted by the patriots to bring them and their leader over to the popular cause. Morillo is said to have at first undertaken to play the part which was afterwards so gloriously played by *Riego* and *Quiroga*, but to have soon repented of his acquiescence, and betrayed the plan to the government. He then set sail for the new world. Morillo began by the siege of *Carthage*, and entered that city on the 16th of December, 1815, after having experienced a glorious resistance from the inadequate and exhausted garrison, which at last succeeded in opening a passage through the blockading squadron.

While the siege was carrying on he rendered himself hateful to the Venezuelans by the confiscation of property, and the cruelties which he committed. After the fall of *Carthage* he marched into *New Grenada*, and reduced the province; and here, again, he had recourse to the system of bloodshed and pillage. For a while the spirit of the Americans seemed to be extinct; but in 1817 it was again roused by *Bolivar*, *Paez*, *Arismendi*, and other generals, and Morillo was defeated in several engagements. In the campaign of 1818 the two parties experienced alternate success, though, on the whole, the balance was in favour of the independents; but in 1819 the scale was decidedly turned against the Spanish general. He was routed in various actions, and was entirely driven from *New Grenada*, and from a great part of the *Caraccas*. On intelligence being received of the revolution which had taken place in Spain in 1820, an armistice was concluded between the royalist and republican generals; and towards the close of that year Morillo returned to Spain, leaving the command in the hands of *General La Torre*. He joined the court party, and was probably one of the authors of the insurrection of the guards in July 1822. Finding this unsuccessful, he joined the patriots, and escaped being shot by one of the soldiers only through the interposition of *Riego*. In 1823 Morillo was made captain-general of *Asturias* and *Galicia*, and appointed *Quiroga*, *Campilla*, and the *Empecinado*, to commands under him. When the cortes declared the royal power suspended at *Seville* and *Cadiz*, he expressed his disapprobation of the measure in a proclamation, and at the same time agreed to an armistice with the French general, *Bourck*. He was obliged, though reluctantly, to acknowledge the regency, and delivered up *Galicia* to the French without a blow.

MORISON, ROBERT, a learned English botanist and physician, who was born in 1620, and educated at *Aberdeen*. His reputation as a botanist induced the duke of *Orleans* to appoint him superintendent of the royal gardens at *Blois*, where he published "*A Catalogue of Plants*." He subsequently returned to England and was made physician to the king. As an author he is best known by his "*Prælium Botanicum*." His death took place in 1683.

MORLAND, GEORGE, a clever artist, who directed his attention almost exclusively to the painting of rustic scenery and low life, and who was born in London in 1764. He acquired a great degree of skill as a faithful copier of nature, and in the early part of his career confined himself to the delineation of picturesque landscape; but, having contracted

irregular habits, and a partiality for the bottle and low company, he forsook the woods and fields for the ale-house; stage-coachmen, postilions, and drovers drinking, became the favourite subjects of his pencil. Some of his best pieces exhibit farm-yards and stables, with dogs, horses, pigs, and cattle; or scenes at the door of the village ale-house, designed with all the truth and feeling which communicate a charm to the meanest objects, and proclaims the genius of the artist. Many of his pictures were painted in the midst of embarrassments occasioned by his imprudence, and some of them while under confinement for debts which he had contracted. He fell a victim to intemperance, dying while in confinement, on the 29th of October, 1804.

MORLAND, SIR SAMUEL, a clever mechanic and philosopher, who was born in Berkshire in 1625, and received his education at Cambridge. He was made secretary of state by Cromwell, who sent him to remonstrate with the duke of Savoy against the persecution of the Piedmontese protestants. On his return he published a work of considerable interest, called "The History of the Evangelical Churches in the Valleys of Piedmont." He was the inventor and improver of several scientific instruments, all of which did much credit to his talents, but did not tend to improve his finances, as he expended a considerable portion of his fortune in his favourite speculations. He died in 1696.

MORNAY, PHILIP DE, a distinguished French nobleman of the sixteenth century, who was born on the 29th of October, 1549 at Bui, in Normandy, and educated by his mother in the tenets of the reformed religion. In 1567 he entered the army, and bore his part in the civil wars which at that period distracted France; but, after the massacre of St. Bartholomew's, he left his country, and visited Switzerland, Germany, Italy, and a great part of the north of Europe, including England, where Elizabeth received him with distinguished marks of favour as an able supporter of the protestant cause. When in 1576 Henry of Navarre openly placed himself at the head of the Huguenot party, De Mornay once more took up arms, and continued in the service of this monarch during the whole struggle against the league; but when in 1593 Henry reconciled himself to the church of Rome, De Mornay sent in his resignation, and, retiring from court, devoted the remainder of his life to literary pursuits, and to advocating, with his pen, the cause of that religion which he had defended with his sword. His first work, "A Treatise on the Church," appeared in 1578, and was followed, the succeeding year, by another "On the Truth of Christianity." His most able, as well as most celebrated, work was "A Treatise on the Sacrament of the Lord's Supper," in which he vindicated the Calvinistic doctrine, as opposed to that of transubstantiation; and Cardinal du Perron, two years after its publication, entering into a personal dispute with the author on the subject, in a conference at Fontainebleau, the latter maintained his argument with so much ability as to acquire from those of his own persuasion the appellation of the Protestant Pope. Seven years afterwards he printed a history of the papacy, under the title of "The Mystery of Iniquity." This estimable man, whose learning, constancy, and unblemished morals, acquired the respect even of his opponents, died in 1623 at his chateau of La Forest, in Poitou, whither he had retired in 1621, after hav-

ing been deprived of his government of Saumur by Louis XIII.

MOROSINI, FRANCESCO.—This gallant soldier was born in 1618, and in his capacity of governor of Candia defended that island with 30,000 men against a Turkish force of four times that amount. Compelled at length to surrender, he obtained terms which were better observed by the Ottoman conquerors than was their wont; and although, on his return to Venice, he suffered a temporary disgrace, yet he soon recovered his credit with the government, and was appointed to the office of procurator of St. Mark's. Sailing, afterwards, against his former antagonists, the Turks, he attacked their fleet, not far from the Dardanelles, and totally defeated it, with great loss both of ships and men. Returning in triumph to Venice, he continued to enjoy great popularity. In 1688 he was elected doge, and survived his elevation about six years, dying at Napoli de Romani in 1694.

MORRIS, GOUVERNEUR, an American statesman and orator, who was born at Morrisania, near the city of New York, on the 31st of January, 1752. He was educated at King's college in that city, where he was graduated bachelor of arts in May 1768. Immediately after he entered the office of William Smith as a student of law. In 1771 he was licensed to practise law, and his proficiency in all his studies was remarkable. He early acquired much reputation as a man of brilliant talents and various promise. In May 1775 Mr. Morris was chosen a delegate to the provincial congress of New York. In June of that year he served on a committee, with General Montgomery, to confer with General Washington respecting the manner of his introduction to the congress. He entered with zeal and efficiency into all the questions and proceedings which referred to a vigorous resistance to the pretensions of the mother country. In 1776 he acted as one of the committee for drafting a constitution for the state of New York, which was reported in March and adopted in April of that year, after repeated and very able debates, in which Jay, Morris, and Robert R. Livingston, were the principal speakers. In July 1777 he served as member of a committee from the New York congress, to repair to the head-quarters of Schuyler's army, to inquire into the causes of the evacuation of Ticonderoga. In October of that year he joined the continental congress at York, Pennsylvania, and in 1778 wrote the patriotic and successful pamphlet called "Observations on the American Revolution," which he published at the beginning of 1779.

In July 1781 he accepted the post of assistant superintendent of finance, as the colleague of Robert Morris. He filled every office to which he was called with characteristic zeal and ability. After the war of the revolution he embarked with Robert Morris in mercantile enterprises. In 1785 he published "An Address to the Assembly of Pennsylvania on the Abolition of the Bank of North America," in which he cogently argued against that project. In December 1786 he purchased from his brother the fine estate of Morrisania, and made it his dwelling-place. Here he devoted himself to liberal studies. In the following year he served with distinction as a member of the convention for framing the constitution of the United States. In 1788 he sailed for France, where he was occupied in selling lands and pursuing money speculations until March 1790, when he came to London

as private agent of the American government with regard to the conditions of the old treaty, and the inclination of the British cabinet to form a commercial treaty. In November 1790 he returned to Paris, having made a tour in Germany. In the interval between this period and the beginning of the year 1792, he passed several times on public business between the British and French capitals. In 1792 he received his appointment as minister plenipotentiary to France, and was presented to the king. He held this station with great *éclat* until October 1794. He witnessed the most interesting scenes of the revolution in the capital, and maintained personal intercourse with the conspicuous politicians of the several parties. The abundant memorials which he has left of his sojourn in France, and his travels on the European continent, possess the highest interest and much historical value. He made extensive journeys after he ceased to be minister plenipotentiary, of which he kept a full diary. In the autumn of 1798 Mr. Morris returned to the United States, to engage in politics, with enhanced celebrity and a large additional stock of political and literary knowledge. He was universally admitted to be one of the most accomplished and prominent gentlemen of his country. In 1800 he entered the senate of the States, where his eloquence and information made him conspicuous. The two eulogies which he pronounced, one on General Washington, and the other at the funeral of General Hamilton, are specimens of his rhetorical style. His delivery was excellent. Mr. Morris, at an early period, gave special and sagacious attention to the project of the grand canal by which the state of New York has been so much honoured and benefited. In May 1812 he pronounced a public and impressive eulogium on the venerable George Clinton, and in the same year, an oration before the New York historical society. Mr. Morris died at Morrisania on the 5th of November, 1816. He passed the latter years of his life at Morrisania, exercising an elegant and munificent hospitality, reviewing the studies of his early days, and carrying on a very interesting commerce of letters with statesmen and literati in Europe and America.

**MORRIS, LEWIS.**—This talented American was one of the signers of the American declaration of independence. He was born in the state of New York in the year 1726. He was educated at Yale college, of which he received the honours, and on his return home he devoted himself to agriculture. When the dissensions between the mother country began he was in a most fortunate situation; with an ample estate, an excellent constitution, literary taste, and general occupations of which he was fond. He renounced at once his domestic comforts in order to assert the rights of his country. He was elected to the congress of 1775, wherein he served on the most important committees. That body assigned to him the arduous task of detaching the western Indians from the coalition with Great Britain. On this errand he repaired to Pittsburg, and acted with zeal and address. In the beginning of 1776 he resumed his seat in congress, where he was a laborious and very useful member. When he signed the declaration of independence, it was at the risk of his beautiful and extensive manor near New York, which was in fact soon after laid waste by the British. He quitted congress in 1777, and was afterwards in the state legislature and a major-general of militia. Mr. Morris

died on his paternal estate, in January 1798, at the age of seventy-one, possessing universal esteem.

**MORRIS, ROBERT**, the chief financier of the American revolution, who was born in Lancashire in January, 1733-4. His father embarked for America and caused him to follow at the age of thirteen, and before he reached his fifteenth year he was placed in the counting-house of Mr. Charles Willing, at that time one of the first merchants of Philadelphia. Fidelity, diligence, and capacity gained him the full confidence and favour of his employer, after whose death he was taken into partnership by his son Thomas Willing, subsequently president of the bank of the United States. This partnership lasted from the year 1754 until 1793,—the long period of thirty-nine years. At the commencement of the American revolution Mr. Morris was more extensively engaged in commerce than any other merchant of Philadelphia. No one embraced the American cause with more zeal and firmness, and few with more influence and risk. He declared himself immediately against the stamp act, signed without hesitation the non-importation agreement of 1765, and in so doing the house of Willing and Morris made a direct and serious sacrifice of trade. In 1775 Mr. Morris was appointed by the legislature of Pennsylvania one of the delegates to the second general congress. He was placed upon every committee of ways and means, and connected with all the deliberations and arrangements relative to the navy, maritime affairs, and financial interests. Besides aiding his country by his judgment and talents for business, he borrowed money to a very large amount, on his personal responsibility, for the use of the government. This personal credit growing out of his reputation for probity, ability, and resources, was wonderful, and of incalculable advantage to the American cause. It rarely failed when the treasury yielded nothing for the public exigencies. In May 1777 he was elected a third time to congress by the legislature of Pennsylvania, and continued to be the soul of the financial concerns. Washington, to whom he was deputed by congress in the autumn of 1777, conceived the utmost faith in his patriotism and ability, which all the subsequent events of their intimate intercourse and the connexion of Morris with public affairs served to perpetuate. In the year 1780 Mr. Morris established a bank by subscription, of which his share was 10,000*l.*, mainly with the object of supplying the army with provisions,—3,000,000 of rations and 300 hogsheads of rum. It continued until the following year, when the bank of North America was founded. His extensive commercial and private correspondence with Great Britain and the continent furnished him with early and important political information. His constant manifestations of confidence in the issue of the revolutionary struggle inspired many others with the same sentiment.

His whole example did incalculable service, and in February 1781 he was appointed superintendent of finance, and, by subsequent resolutions of congress, vested with powers which gave him in fact the control of all the public pecuniary interests. This arduous office he admirably discharged until the end of the war. "The whole business of finance," said he, "may be comprised in two short but comprehensive sentences,—it is to raise the public revenue by such modes as may be most easy, and to expend it in the most frugal, fair, and honest manner." The condition of the treasury when he undertook it was

nearly as bad as possible. Upon its improvement depended the preservation of the military force. The establishment of the bank of North America was one of his first and most beneficial measures. The notes of the institution were declared by congress receivable as gold and silver for the payment of all duties and taxes in each of the United States. Morris furnished the plan and published it with a cogent appeal to the patriotism of all American citizens. A contemporary writer has remarked that "the sudden restoration of public and private credit which took place on the establishment of the bank, was an event as extraordinary in itself as any domestic occurrence during the progress of the revolution." At this time the private fortune of Mr. Morris was ample, but supposed to be much larger than it really was, and he rendered this personal credit subservient to the public good. He pledged it whenever his official resources were inadequate. His advances at particular times on account of the confederacy or of individual states were enormous. His general situation, and the impossibility of relieving all the wants which were referred to his department, exposed him to slanderous charges and harsh suspicions which have in no instance withstood a fair inquiry. The necessary supplies of every thing required for Washington's expedition against Cornwallis were obtained chiefly by means of Mr. Morris's credit. He issued his own notes to the amount of 1,400,000 dollars, which were finally all paid. The history, however, of the difficulties which he had to evade or overcome, and the expedients to which he resorted in the course of his financial administration, would fill a volume.

In January 1783 Mr. Morris announced to the president of congress his intention to resign the office of superintendent of finance. Nothing but the public danger could have induced him to accept it, and the danger being past, he felt himself at liberty to escape from excessive toil and manifold liability. He consented, however, to serve until the 1st of May. On the 2nd of May, after repeated conferences with a committee of congress, he was prevailed upon to continue in office, and he did not finally leave it until November 1784. At his request in May of that year, congress appointed a board of treasury-commissioners, who were to co-operate with and succeed him in the management of the finances. In rendering an account of his stewardship he published an able address to the inhabitants of the United States containing excellent counsel. The American congress had resolved that, "until an agent of marine should be appointed, all the duties, powers, and authority assigned to that office should devolve on and be executed by the superintendent of finance." The additional burden was irksome to Mr. Morris. No agent was appointed and he was thus obliged to administer the affairs of the navy until the close of the year 1784. His expansive faculties, his habits of order, his energy and rigid justice in the transaction of business, enabled him to acquit himself creditable in this sphere. In 1786 Mr. Morris consented to be elected into the assembly of Pennsylvania in order to obtain the renewal of the charter of the bank of North America. Party spirit prevailed over his eloquence, but the exertions of the friends of the institution were in the succeeding legislature crowned with success. In 1786 he was elected a member of the convention which framed the federal constitution. No man had more often and severely felt the want of

an efficient government. He had incessantly asked for a stronger bond or instrument than the old confederation, for "a firm, wise, manly system of federal government;" and he strenuously co-operated in devising and recommending the present.

In 1788 the general assembly of Pennsylvania appointed him to represent the state in the first senate of the United States which assembled at New York. As a member of that body he distinguished himself by wise counsels, and particularly by an irresistible speech for the repeal of the tender laws. He was a fluent, correct, and impressive orator; he wrote with ease and terseness; his fund of political knowledge could not but be ample; his acquaintance with the affairs of the world exceeded in extent and diversity that of any of his fellow patriots, Franklin excepted; his conversation was therefore replete with interest and instruction. When the federal government was organized, Washington offered him the post of secretary of the treasury, which he declined, and being requested to designate a person for it, he named General Hamilton. At the conclusion of the war he was among the first who engaged in the East India and China trade. In the spring of 1784 he despatched the ship *Empress of China*, Captain Green, from New York to Canton, being the first American vessel that ever appeared in that port. He also made the first attempt to effect what is termed an out of season passage to China. This passage is effected by going round the south cape of New Holland, thus avoiding the periodical winds prevalent at certain periods in the China sea. In prosecution of this object the ship *Alliance*, Captain Read, equipped with ten twelve-pounders and sixty-five men, sailed from the Delaware, on the 20th of June, 1787, and arrived in safety on the 22nd of the following December at Canton, where considerable inquiries were made by the European commanders respecting the route that had been taken, as it was wholly a novel thing for a vessel to arrive at that season of the year. As no ship had ever before made a similar passage great astonishment was manifested, and the lords of the admiralty subsequently applied to Mr. Morris for information with regard to the track of the ship. It is said that her probable route was, previous to her departure, marked out by Mr. Morris with the assistance of Mr. Gouverneur Morris. In his old age Mr. Morris embarked in vast land speculations, which proved fatal to his fortune. The man to whose financial operations the Americans were said to owe as much as to the negotiations of Franklin, or even the arms of Washington, passed, to the disgrace of the American government, the latter years of his life in prison confined for debt. He sunk into the tomb on the 8th of May, 1806.

MORRISON, ROBERT.—This gentleman was sent to China in 1816 by the English bible society, for the purpose of acquiring the language of the Chinese, in order to make a correct translation of the Holy Scriptures into it; and he accompanied Lord Amherst to Peking. Canton or Macao was his usual place of abode, and he there filled the situation of Chinese translator to the East India company. He has published "*Horæ Sinicæ, or Translations from the Popular Literature of the Chinese*," "*A Grammar of the Chinese Language*," "*An Anglo-Chinese Dictionary*," in several parts, and "*A Complete Version of the New Testament*," in eight volumes. In 1820 he erected an Anglo-Chinese college at Malacca,

for instruction in English and Chinese literature, and for the propagation of Christianity. In 1826 he returned to England, bringing with him a collection of 10,000 Chinese books, with a valuable store of information relative to the country.

**MORTIER, EDWARD ADOLPHUS CASIMIR JOSEPH**, duke of Treviso, a French nobleman, who was born at Cambray in 1768. He received a careful education, and entered the military service in 1791 as lieutenant in a regiment of carabiniers, he afterwards became captain of the first battalion of volunteers of the department of the north, and took part in the battles at Quiberon, Gemappe, Neerwinden, and Hondtschoote. In 1799 he was made general of brigade, and soon after general of division. On the 15th of March, 1800, he received the command of Paris, and evinced his attachment to Bonaparte at the time of the unsuccessful attempt against the first consul on the third Nivose. After hostilities had recommenced against England in 1803, he occupied the electorate of Hanover. On his return he was made one of the four generals of the consular guard, and in May 1804 marshal of the empire. In the following September he took the command of a division of the grand army, passed to the left bank of the Danube, and was defeated in the battle of Durnstein by Kutusoff. In the war with Prussia he took possession of the electorate of Hesse, passed through Hamburg to the shores of the Baltic, occupied the Hanse towns, and conducted the hostilities against Sweden till Napoleon, towards the end of the campaign, recalled him to the grand army, where he took part in the battle of Friedland. He then commanded in Spain, where, in connexion with Lannes, he took Saragossa, defeated the Spaniards at Ocana, and assisted Soult in his plans against Badajoz. In 1812 he commanded in Russia, and was left in the Kremlin by Napoleon when he marched out of Moscow with orders to blow it up. At the re-opening of the campaign in 1813 he was placed at the head of the young guards, fought at Lützen, Bautzen, Dresden, Hanau, and in 1814 in the different battles in France, and acceded to Napoleon's dethronement. Louis XVIII. made him a peer of France. He was in Lisle when the king fled to that city in 1815, and informed the king of the unfavourable disposition of the garrison. Louis went to Ghent, and Mortier entered the service of Napoleon. After the second restoration he lost his dignity of peer, but was made commander of the military division in Rouen.

**MORTON, JOHN**, a celebrated English ecclesiastic, who was born in 1410, and educated at Oxford. His knowledge of the law and general character for ability recommended him to Henry VI., who made him master of the rolls in 1473, with a seat in the privy council. He served that and the succeeding monarch with great fidelity; the latter, Edward IV., made him lord high chancellor, and advanced him to the see of Ely. When Richard III. ascended the throne he ordered him to be placed in confinement; he however escaped and remained in concealment till the dethronement and death of Richard. He was promoted to several valuable posts by Henry VII., and died much regretted in the ninetieth year of his age.

**MORTON, JOHN**, an American who distinguished himself in the war of independence in that country. About the year 1764 he was sent as a de-

legate to the general assembly of Pennsylvania, of which he continued to be for many years an active and distinguished member. He was deputed to the congress of 1774. On the question of declaring independence in 1776, the delegation from Pennsylvania being divided, Mr. Morton gave his casting vote in the affirmative. This was an act of signal intrepidity under all the circumstances of the case. In the following year he assisted in organising a system of confederation for the colonies, and was chairman of the committee of the whole at the time when it was agreed to, on the 15th November, 1777. He died in that year of an inflammatory fever, in the fifty-sixth year of his age. His character was estimable in private as well as public life.

**MORVEAU, LOUIS BERNARD GUYTON DE, BARON**, a celebrated chemist, who was born at Dijon in January 1737, and distinguished himself in 1773 by the invention of the method of purifying the atmosphere by means of chlorine, which is now generally employed with the greatest success. Morveau was previously general-advocate of the parliament of Dijon, an able man of business, eloquent and upright. He founded a school at Dijon for his favourite study, chemistry, and during thirteen years conducted it himself. In 1801 appeared his "*Description Complète des Procédés de Désinfection*." In 1791 he was made member of the national assembly, afterwards of the convention. At the battle of Fleurus he ascended in a balloon. In 1797 he retired to private life. Subsequently he was chosen a director of the polytechnic school, which he assisted to establish, and a member of the institute. After the restoration he was pensioned. He died on the 2nd of January, 1816.

**MORYSON, FINES**, a topographical writer of considerable talent, who was born in Lincolnshire in 1566, and educated at Cambridge. Having completed his studies he went to the continent, where he remained for some years, and on his return went to Ireland, where he died in 1614. He published "*A History of Ireland from 1599 to 1603, with a short Narration of the State of the Kingdom from the Year 1169*," and "*An Itinerary containing Ten Years' Travels through the Twelve Dominions of Germany*."

**MOSCATI, PIETRO**, a celebrated physician and statesman, who was born in 1736 at Milan. As his talents were obvious at an early period, his father cultivated them with the utmost care, and at length sent him to Tuscany, and afterwards to Turin, to study under the direction of Bertrandi and Beccaria. Moscati, after having taken his doctor's degree at Pavia, was appointed assistant-physician to the hospital at Florence, where, and at Bologna, he diligently laboured in the acquisition of professional knowledge. In 1764 he was elected professor of anatomy and surgery in the university of Pavia, and published his anatomical lessons, and "*A Discourse on the Physical Differences which exist between Man and Animals*." Both of these works were well received and the latter was translated into German. In 1772 Maria Theresa nominated him professor of midwifery-surgery, and placed him at the head of a foundling establishment which she had formed. In 1796 Moscati espoused the cause of Italian liberty and became a member of the Cisalpine congress. In 1797 Bonaparte selected him as one of the fittest persons to be director of the Cisalpine republic; and when Moscati wished to decline the office, the general replied

to him, "If honest men refuse, I must appoint knaves." Moscati therefore accepted it; but he soon resigned, and resumed his medical pursuits. He was arrested by the Austrians in 1799 and confined in the fortress of Cattaro, where, however, he was liberated to attend on the arch-duke Charles, who had fallen ill. After the battle of Marengo he returned to Italy, and was one of the deputies sent to the *consulta* at Lyons. Under the government of Napoleon he was successfully made director-general of public instruction, a senator, a dignitary of the iron crown, grand eagle of the legion of honour, and a count. He was also highly respected at the vice-regal court, and was the favourite physician of the viceroy and the vice-queen. Moscati was sincerely attached to Eugene Beauharnais, and was one of the senators who was the most active in 1814 in endeavouring to raise him to the throne. He was afterwards one of the directors of the Italian institute, and president of the central council of health. He founded at his own expense a meteorological and astronomical observatory. In private life he was universally esteemed for his many virtues and the affability of his manners. He died in 1824.

MOSCHELES, IGNATIUS, a most celebrated pianist and popular composer, who was born at Prague in 1794. He was the son of a Jew, who, having discovered the musical taste of the child, had him instructed by Weber, the director of the conservatory there. The boy was first taught the compositions of Mozart, which he executed with a precision and expression that excited the astonishment of connoisseurs. Bach's and Handel's works were his next studies. He was equally successful in them and soon displayed a remarkable talent of extemporising on any given subject. He soon made himself master of the laws of counterpoint. Even in his eighth year he had already made some attempts at composition. His instructor next obliged him to practice and study Clementi's compositions for the piano, and the young artist made his appearance in a public concert in 1806. His skill, purity, and vigour of expression, and knowledge of harmony, were universally admired, and induced several amateurs to send him to Vienna to complete his education. There he enjoyed the instruction of the celebrated Albrechtsberger and Salieri, and made such astonishing progress as to become the chief performer at the concerts of instrumental music and the favourite of the Vienna public. After making his appearance in different parts of Germany with universal applause, Moscheles set out in 1820 on a professional tour in Holland, France, and England, and in all these countries was no less successful than he had been at home. He afterwards made a second visit to London, and returned in 1826. He afterwards appeared in the countries in the north of Europe, whence he returned in 1830, and performed in Paris. As an artist Moscheles was remarkable for his elevated style and the almost incredible facility with which he overcomes difficulties. As a composer he was much esteemed; but his compositions are extremely difficult of execution.

MOSCHUS, a Greek pastoral poet, who was a native of Syracuse. The time when he lived is not accurately known, some making him a pupil of Bion, who is supposed to have lived under Ptolemy Philadelphus, while others suppose him a contemporary of Ptolemy Philometer. The tenderness with which he speaks of Bion in his beautiful elegy on that poet,

implying a personal acquaintance, seems to render the former opinion most probable. A few idyls form the whole of the remains of Moschus, which exhibit great elegance of style and delicacy of conception. They are generally printed in conjunction with those of Bion, and may be found in the "*Poetæ Minores*," as also a separate volume by Meckercke. The death of Bion as commemorated by this poet is a favourable specimen of his style.—

"*Sicilian Muses, pour the dirge of woe:  
The swallows, nightingales, that wont to know  
His pipe with joy, whose throats he taught to sing. :  
Perch'd on the branches, made their dirges ring:  
All other birds replied from all the grove;  
And ye too mourn, oh every woodland dove!*"

"*Sicilian Muses, pour the dirge of woe:  
Who, dear-beloved! thy silent flute shall blow?  
What hardy lip shall thus adventurous be?  
Thy lip has touch'd the pipe; it breathes of thee:  
Mute echo, too, has caught the warbled sound  
In whispering reeds, that vocal tremble round:  
I bear the pipe to Pan; yet, haply, he  
May fear the trial, lest eclipsed by thee.*"

"*Sicilian Muses, pour the dirge of woe:  
The tears of pensive Galatea flow,  
Missing thy song, which on her ear would glide  
When on the sea-shore sitting by thy side:  
Unlike the Cyclops' music was thy lay,  
For she from him disdainful fled away;  
She from the beacon look'd on thee serene,  
And now, forgetful of the watery scene,  
Still on the desert sands, beside the brine,  
She feeds the wandering herds, that late were thine.*"

"*Sicilian Muses, pour the dirge of woe:  
Whatever gifts the Muses could bestow,  
Are dead with thee; whate'er the damsel's gave  
Of sweet-lipp'd kisses, buried in thy grave.  
Around thy sepulchre the Loves deplore  
Their loss: and Venus, shepherd! loves thee more  
Than the soft kiss, which late she bent to sip  
From dying fragrance of Adonis' lip."*

The tomb of this celebrated poet was brought from Abydos by order of the French government and placed in the great national museum at Paris. An accurate representation of this ancient monument is given in the sketch beneath.

MOSELEY, BENJAMIN, an English physician, who was born in the county of Essex, and went early in life to Jamaica in the West Indies, where he practised for many years as a surgeon. At the time that

Dr. Moseley resided in Jamaica the contest with our colonies still raged with unabated violence, and the troops quartered in Jamaica were uncommonly unhealthy. Indeed in that, as in other islands, there are periodical returns of tropical diseases, that sweep all away before them, more especially during war; but it was reserved for a later day to behold contagion and desolation spreading all around in the "piping times of peace and plenty." The abilities of Dr. Moseley on this occasion were called into action; and he had to contend, among others, with two of the most terrible diseases that either civilians or soldiers can be attacked with. These considerations of course led to investigation and inquiry; and he not a little increased his reputation by an essay, printed and published at Kingston, on the best modes of treatment and cure. This work was afterwards reprinted in England, and has passed through several editions. Dr. Moseley, having succeeded so far in his professional avocations as to acquire a certain degree of celebrity, and a considerable portion of wealth, determined to return to Europe. He accordingly embarked at Port Royal, and sailed for the coast of North America. The war with the colonies had now ceased, and their independence was solemnly recognised by a treaty with the mother country. Having visited New York and Philadelphia, Dr. Moseley was well received by his professional brethren in the New World, who were intimately acquainted both with his writings and his merits. He was accordingly elected a member of the philosophical society, and visited most of the States, for the purpose of making himself familiar with the existing state of practice and the principal medical men resident there.

On his arrival in Europe he determined to devote his time and attention to the further acquirement of medical knowledge. Accordingly, after observing the current practice in England, he repaired to the continent, and took his degree as M. D. at Leyden; he also visited the principal cities and hospitals of Europe, for the purpose of attaining an accession of medical knowledge. After this he determined finally to settle in England, and accordingly came to London about the year 1785 for the express purpose of practising as a physician. But as a previous step, it was necessary to obtain the sanction of the college; and accordingly, after the usual examination, he was permitted to visit patients as a licentiate. But as he was an entire stranger in the capital, it became necessary to make himself known by his writings. He accordingly published a treatise on coffee, one of the indigenous plants of Jamaica. This recommended him to the planters; and the committee of merchants of that island are said to have presented him with a puncheon of rum, in return for a pamphlet calculated to render the beverage produced from that berry more extensively known and used. In the course of the same year he published a treatise on the tropical diseases, and it is almost unnecessary to add, that none of his contemporaries, perhaps, possessed a larger share of experience, or were better acquainted with the maladies prevalent in the vicinity of the equator.

Dr. Moseley soon acquired celebrity by his writings, which were so popular that several editions were called for in succession within a very short space of time. This fortunate event of course led to practice; and it was a circumstance highly favourable to his

future fortunes, that the notice of the late earl of Mulgrave being attracted by his publications, he first became his patient, and next his patron. This nobleman, who occupied a high situation in the state, was then languishing under a nervous disease, which, if not cured, was at least palliated by the bold and successful prescriptions of his favourite physician. Nor did he suffer him to pass unrewarded; for on the death of the celebrated Dr. Monsey, Dr. Moseley was nominated his successor as physician to Chelsea hospital. This proved to be, if not a very lucrative, at least a very desirable appointment.

In 1799 Dr. Moseley added not a little to his reputation by a treatise on sugar, which again recommended him to the notice and gratitude of his old West Indian friends and connexions. But a remarkable epoch had now occurred in the history and practice of medicine; and unfortunately, the doctor took an active part, and declared himself publicly against the new mode. Deeming the Jennerian system of inoculation not only an innovation, but one of a most dangerous tendency, he opposed it with all his might, and supported his opinions by publications.

The doctor, who was always a bold practitioner, towards the latter end of his life supposed he had attained that great desideratum in medicine, a remedy for the most frightful of all maladies, perhaps, with which suffering humanity can be afflicted; that is, hydrophobia, to the prevention and cure of which he now dedicated a treatise. In this work we find a history of the disease, with a complete series of the different stages of canine madness, illustrated with a variety of cases.

For several years Dr. Moseley was in the habit of visiting his native county once a year. The period chosen was during the summer months. Of this place he was not only fond himself, but in the constant habit of recommending it to all his patients; and at this favourite spot, worn out by age rather than infirmities, he died on the 15th of June, 1819, having attained the age of eighty.

MOSELEY, WALTER MICHAEL, a writer of considerable merit, who was born in 1765 at Glasshampton, in the county of Worcester. He received the rudiments of his education at a school at Wolverhampton, and was then sent to the university of Edinburgh to complete his studies. Upon his return to Glasshampton about 1789, he found the young and fashionable in various parts of England eagerly engaged in the revival of the practice of archery. He, too, was attracted; but instead of regarding archery as a mere amusement, he was led by a more philosophical spirit to enquire into the history of the bow and its connexion with the revolutions of society. He saw in it the instrument by which empires had been lost and won. In 1792 he published "An Essay on Archery," a work equally elegant and learned, in which he traces the history of the bow from the earliest ages. This essay was well received; and as the amusement is still pursued, and the book is become scarce, it is hoped that a new edition will be published. About this time the new discoveries of Lavoisier had excited great attention, and seemed likely to effect, as they have indeed effected, an entire change in the previously received chemical theories. At Edinburgh, Mr. Moseley had formed an intimacy with Josiah Wedgwood, whom he accompanied on a tour in Scotland, where he made an extensive collection of minerals. This young gentleman was engaged in

a course of chemical experiments, in which he proved eminently skilful. Mr. Moseley, emulous of his example, and moved by the public agitation of the subject, entered eagerly upon the same pursuit; he collected a costly laboratory, repeated the principal experiments, contrived new ones, and gave the subject his undivided attention for several years.

He subsequently directed his attention to the science of botany. This was rendered more interesting to him as he had married a lady who aided him with her pencil.

Mr. Moseley was the proprietor of the manor of Buildwas, in the county of Salop, which formerly belonged to a fraternity of Cistercian monks. The venerable ruins of the abbey still remain. He arrested, at considerable expense, the progress of dilapidation, feeling an interest in this foundation as owner; and urged by the curiosity of an antiquary, he commenced a laborious investigation of its history and customs. This unavoidably led him to inquire into the nature generally of the monastic institutions. In the result he collected materials for an interesting volume. It was from this manuscript that Mr. Moseley furnished Mr. Britton with the brief account of Buildwas Abbey in the fourth volume of his "Architectural Antiquities of Great Britain."

About the year 1817 he began to attach himself to astronomy, his last, his favourite, pursuit. He may indeed be thought to have shortened his life by the anxious toil in which he was involved by his curiosity respecting certain disputed discoveries in that science, and his desire to do justice to the fame of his own countrymen, in opposition to the claims of foreigners. He possessed accuracy of vision, unwearied patience in calculation, and dexterity in the use of instruments, of which he had a valuable collection. Mr. Moseley died on the 16th of July, 1827. It may, however, be questioned whether, if fame, instead of his real incitement, the pure love of knowledge, had actuated him, he was fortunate in his choice. Such great advances have been made in that science by the rare union of the most refined theory and exquisite observation, that little chance of great renown remains for future adventurers. Mr. Moseley has left observations of transits and north polar distances made during several years; and by his close attention to those beautiful objects, the double stars, he seems to have confirmed the opinion that they change their position in regard to each other.

**MOSES.**—This great Hebrew law-giver was born in Egypt about 1600 B. C., among the then severely oppressed Jewish people. Three months after his birth, his father Amram, and mother Jochebed, both of the race of Levi, were obliged to expose him, in obedience to a royal command, which enjoined that all the male children of the Hebrews should be put to death. But the daughter of the Egyptian king (a tradition preserved by Josephus names her Thermutis), going to bathe in the Nile, found the child exposed in a carefully constructed basket of bulrushes upon the border of the river, and took compassion upon him. His sister Miriam, who was standing near, offered to procure him a nurse, and immediately summoned his mother. The feelings of his unhappy people were therefore instilled into him with his mother's milk, and he returned, when he had reached a fit age for instruction, to the king's daughter, who named him Mo-udsche (whence the Hebrew Mocheh), signifying one delivered from the waters, and adopted

him as her son. He was afterwards educated for the duties of the priesthood, to which the royal family belonged, and could now, as the disciple of the priests, attain to all the arts and knowledge which this privileged caste carefully confined within the limits of their order. The means of instruction thus afforded him were the best which his time possessed; and Moses penetrated still deeper than his instructors into the secrets of their religion, physics, legislation, and government, as appears plainly from his words and actions.

His expedition into Ethiopia in the fortieth year of his age as leader of the Egyptians, when he subdued the city of Saba, won the affections of the conquered princess Tharbis and married her, rests only on the tradition preserved by Josephus. Yet Moses could not forget his people in the splendour of a court: an outrage committed by an Egyptian on a Hebrew excited his anger, and he secretly slew the Egyptian. But this deed became known, and he escaped the pursuit of the king only by a hasty flight into Arabia. Here he took refuge with Jethro, a Midianitish prince and a priest, and espoused his daughter Zipporah, whom, at their first meeting, he had rescued from hostile shepherds. Thus the adopted son of a king's daughter became the herdsman of an Arabian, and history does not say that he aspired to any thing greater. But the misery of his nation must have been continually present to his mind, and not in vain had he been led by extraordinary means into the sanctuary of Egyptian wisdom, and endowed with the rarest powers and knowledge. This knowledge occupied his mind in his solitude, and explained to him the secrets of nature, whose mysteries and wonders addressed him in a solemn tone amid the deserts and mountains of Midian, and elevated his heart to that God whom he discerned more clearly than his fathers. Yet the germ of his great undertaking remained for a long time maturing in his mind before it was brought to light, and assumed the form of a deeply meditated plan. Moses had already attained to an age which gives mature experience, patience, and tranquillity of mind, when this took place through an immediate interposition of God. While he was feeding his flock on mount Horeb, he saw a bush on fire, and considering why the bush was not consumed he heard the voice of the Lord proceeding from it, who announced himself to him as the God of Abraham, Isaac, and Jacob, and commanded him to lead his people out of Egypt into the land which he had promised to the patriarchs. The name Jehovah, by which God declared himself, was already known to him by means of the Egyptian mysteries, and conveyed the idea of the one everlasting and unchangeable. But not without anxiety, arising from the view of the difficulties which he should meet with, and from his modesty, did he determine to obey this call. Pharaoh, he thought, is hard and unbelieving, he himself outlawed, his people rude, and incapable of comprehending the idea of the God whom he should announce to them. Being slow of speech, and possessing none of the arts of an orator, his words will not be believed without visible signs. God therefore gives him power to prove his mission by miracles, and joins to him his elder brother Aaron as a speaker. Thus prepared, Moses becomes confident that he shall succeed with the assistance of God and returns to Egypt, a gray-haired man of eighty years, to undertake the work. All the difficulties

which he had foreseen, and yet greater ones opposed him. He had the eloquence of Aaron it is true to aid him, and the people of Israel must recognise the hand of God in his deeds; but, degraded by long slavery, they wavered between belief and doubt.

In vain did he produce changes in the ordinary course of nature, which could not be imitated by the art of the Egyptian sages, and for the performance of which a higher power was obviously requisite. The tenth of the destructive plagues which afterwards came upon Egypt—the destruction of all the first-born—first moved the hardened heart of Pharaoh to allow the Hebrews to depart. Moses placed himself at their head, and conveyed them, with all their possessions, out of Egypt, passing, under the protection of God, through the midst of the Red Sea, in which the faithless Pharaoh, pursuing them, was drowned, with the army which followed him. Yet this deliverance from a formidable enemy was only the beginning of his enterprise. A rude tumultuous people was around him, who, until now, had obeyed the scourge of their taskmasters, but knew not how to live in freedom. Their distress in the desert excited loud murmurs; their meeting with the hostile Bedouins occasioned bloody combats; the jealousy of the elders produced dissensions and opposition to their leader; his life was often in danger, and he was often obliged to maintain his authority by force and severe punishments. But, with wonderful wisdom, he remained firm, in spite of all opposition, to his plan of transforming the stubborn multitude into a devout, civilized, and independent people. He supplied the hungry with food from heaven, and opened to the thirsty new fountains upon the rock of Horeb, by the aid of God, who granted to his petition what the people needed.

In all his ordinances he declared himself to have the express command of God, who wished to draw his people to himself and to form their hearts by love and fear. Religion is the spirit of the law which Moses began to announce three months after his departure from Egypt. Arrived at Sinai, a mountain of Arabia, he allowed the people to encamp, while he himself ascended the holy summit to pray, where, surrounded with thunder, and trembling at the presence of God, the laws were announced to him which were to regulate the lives of the Israelites. Founded upon the faith of the patriarchs, these laws are rather a restoration of the simple truths which had governed the primitive world than a new religion. As presented by Moses, they were purified from the errors and follies of superstition, which had gathered round them among idolatrous nations, and were exhibited in a form adapted to the wants of the Hebrews, who had grown from a single family to a rude ungoverned multitude. The great object of his legislation is to inculcate the doctrine that Jehovah is the only God, who will allow no other god besides himself, nor any visible image of his being; that he is himself the king of his people, and that he will rule them by his priests: hence the laws by which Moses regulates the worship of the Hebrews, the administration of the government of justice, and even directs their manners, and lays down rules for the care of their health, bear the marks of their heavenly origin. Arising from the wants of the moral and physical nature of man, they are excellently adapted to the peculiar character of the people, to the climate, and to the political position of the land appointed for their dwelling, and to

the plan of Providence of making this people the depository of a divine revelation, to be developed in the fulness of time, and finally extended over the world. These laws forbid intermixture with other nations, the introduction of foreign customs, and the adoration of strange deities.

As a people peculiarly dedicated to God, the Hebrews were to be separated from all neighbouring nations, and to stand separate and independent, relying upon God as their Lord and master. Regulations, extending to the minutest particulars of the daily occurrences of life, in which even the selection and preparation of their food, and the care of personal cleanliness, were not forgotten, gave them habits adapted to their character and religious destination. A ritual, composed of a thousand minute ceremonies, and, as a whole, allegorically designating a covenant with God, to be incessantly renewed by offerings, prayer, and purification, imposed on them the duty of continual diligence in the service of their heavenly king. To the race of Levi, to which Moses belonged, he assigned the care of the religious service, and of seeing that the laws were obeyed, investing, not his sons (whom he allowed to take their place among the common Levites), but the descendants of his brother Aaron, as God commanded, with the first office in the kingdom,—that of highpriest. To this tribe, excluded from all property in land, the other tribes were to pay tithes: they were subjected to the authority of elders and judges, and the firmness of their political union was secured by certain festivals, to be celebrated by them in common, and by exclusive devotion to the service of God in the tabernacle,—a movable temple, regarded with awe, as the appointed dwelling of Jehovah, into the interior of which the priests alone were allowed to enter, and where, moreover, all the taxes were deposited, so that it was the central point of all the riches of the nation.

These are the chief points in the legislation of Moses, which, even if it displays some Egyptian features, yet plainly manifests the endeavour to wean the Hebrews from Egyptian customs and prejudices, and to elevate them to political and religious independence, and far surpasses, in originality and elevation of principle, in consistency and expressiveness, and, what most proves its heavenly origin, in proofs of true humanity, the boasted legislation of Solon and Lycurgus. Yet its importance was not at once recognised by the Hebrews. When they were already near the end of their journey towards Canaan, Moses saw himself compelled, in consequence of new evidences of discontent, to lead them back into the desert, and forty years of toilsome wandering must be passed there: the severe punishments which the law threatens against transgressors must be executed in all their rigor: all those who had attained to man's estate at their departure from Egypt must die before the law could be thoroughly known, and become habitual with those who had been born during the wandering. Moses himself, distressed with cares, troubles, and occupations of all kinds, was not permitted to live to see the complete accomplishment of his plan, on account of a murmur which, in the midst of his distresses, he allowed to escape against his God. After he had appointed Joshua to be the leader of the Hebrews, and had taken a solemn farewell of the people, he ascended a mountain in Peræa, beyond Jordan, from which he surveyed the land of

promise, which he could not enter, and closed his eventful life in his 120th year.

He prevented all superstitious reverence for his bones by his command that his remains should be buried secretly, and the place of his grave concealed from the people. The books which stand under his name at the head of the Old Testament form the best monument of his worth. As it has been supposed that the material upon which he wrote was stone, and as it was hardly possible for works of the size of the Mosaic to be written at length on such a material, critics have attributed their collection and arrangement in five books (whence their name, in Greek, *Pentateuch*), to a later writer, of the time of David or Solomon. But M. Greppo, in his essay on the hieroglyphic system of Champollion, maintains that Moses might have written on papyrus, and refers to an Egyptian manuscript on papyrus, in the museum at Turin, containing an act drawn up in the reign of Thouthmosis III., two centuries at least before Moses; and it is generally admitted that much must have been written by him; especially the laws, which he could not trust to uncertain tradition, in the books of Leviticus and Deuteronomy. It is equally certain that he is the author of the magnificent songs, in which he celebrates the deliverance of the Israelites from the Red Sea, and blesses and takes leave of the people before his death. The collection of the several portions of his writings into a whole may be the work of a later time, which cannot be fixed within more precise limits than those above mentioned.

MOSES, CHORENENSIS, an historian and geographer, who flourished about A. D. 462. His principal work, "A History of Armenia from the Deluge to the Middle of the Fifth Century," was first published with a Latin version by John and William Whiston in 1736; and, though mixed up with a great deal of fable, is a valuable history, containing many narratives not elsewhere to be found. He was also the author of an "Abridgment of Geography," first published at Amsterdam in 1668, and several canticles, which are sung in Armenian on the anniversary of Christ's presentation to the temple.

MOSS, ROBERT, an English divine, who was born at Gillingham, in Norfolk, in 1666. He received the rudiments of his education at Norwich school, and afterwards removed to Cambridge. He was made B. D. in 1690. He was sworn chaplain, in three succeeding reigns, to King William, Queen Anne, and George I., and being one of the chaplains in waiting when Queen Anne visited the university of Cambridge in April 1705, he was then created D. D. In 1708 he was invited by the parishioners of St. Lawrence Jewry, on the resignation of Dean Stanhope, to accept of their Tuesday lecture, which he held till 1727, and then resigned it on account of his growing infirmities. In 1712, on the death of Dr. Roderick, he was nominated by the queen to the deanery of Ely, which was the highest but not the last promotion he obtained in the church; for in 1714 he was collated by Robinson, bishop of London, to Gliston, a small rectory on the eastern side of Hertfordshire. The gout deprived him of the use of his limbs for some of the last years of his life, and he died in March 1729, in his sixty-third year, and was buried in the presbytery of his own cathedral. Dr. Moss was the author of several valuable theological works.

MOSSOP, HENRY, a clever tragic actor, who was

born in Ireland in 1729. He was the son of a clergyman who held a rectory in the province of Connaught, and was educated at Trinity college, Dublin, where he took a degree. He made his first appearance on the stage at Dublin. He afterwards removed to London, where, next to Garrick and Barry, he was esteemed the principal tragedian of his time. In 1761 he became manager of one of the Dublin theatres in opposition to Barry and Woodward; and the rivalry proved ruinous to all parties, and especially so to Mossop, whose vanity and intemperate conduct having at length excluded him from the exertion of his professional abilities on the metropolitan stage, he was reduced to great distress, and died in absolute penury at Chelsea, in November 1773.

MOSTOWSKI, COUNT THADDEUS, an illustrious Pole, who is entitled to an honourable place among the patriots of his country. He was born at Warsaw in 1766, and in 1790 was nominated castellan, by virtue of which office he had a seat in the senate. At this period he established a national gazette, which produced a powerful effect on the public mind. On the proclaiming of the constitution of 1791 he became a member of the constitutional committee; but when in 1792 Stanislaus was compelled by the Russians to accede to the confederation of Targowitz, and consequently to the overthrow of Polish liberty, Mostowski quitted his country, being, it is said, despatched on a mission to Paris by his fellow-patriots. At Paris he became connected with the Girondist party, which then held the reins of government, and it is believed that he obtained a promise of assistance for the Poles; but the triumph of the Jacobins, on the 31st of May, put an end to his prospects. He even became an object of suspicion to the dominant faction, and narrowly escaped being guillotined. On his return to Poland he retired to his estate, but was immediately arrested by the Russian minister, and confined in his own house for three months. Having at length recovered his freedom, he took an active part in the efforts which were made by his countrymen to expel their oppressors. He was successively a member of the provisional council, the great council, and the council of war; and, after the capture of the suburb of Praga by Suwarow, when no hope was left of saving Poland, he proposed to his colleagues a scheme which could have been conceived only by a man of courage and talent. It was to collect the 25,000 men who yet remained, with a train of 100 pieces of cannon, and, by a forced march through Germany, to join the French army on the Rhine. The plan was adopted, but circumstances prevented it from being carried into execution. He refused to fly from Warsaw, and, in conjunction with Ignatius Potocki, was employed to negotiate the surrender of the capital to Suwarow, who pledged himself that persons and property should be respected. Mostowski was nevertheless seized and sent to St. Petersburg, where he remained in confinement till he was liberated by Paul I. From that period till 1805 he lived on his estate in Poland, dividing his time between agriculture and literature. He became a member of the Warsaw literary society, and published twenty-six volumes of a beautiful edition of the Polish classical authors. In 1805 he revisited France, and in 1809 bought an estate in that country, on which he resided till 1815. It is probable that he concurred in the measures which were taken in 1807 and 1812 for the liberation of his native land; but

his name was not brought before the public. In 1815 the emperor Alexander recalled him to Poland, and appointed him minister of the home department and of police.

**MOTANABBI, ABUL TAYLIB AHMED AL**, a celebrated Arabian poet, who was born at Cufa in 915. He studied at Damascus, and applied himself especially to grammar and the belles lettres. At length, being inflamed with a passion for poetry, he gave himself up to the cultivation of that species of literature with the utmost enthusiasm, and professed to believe that he was divinely inspired. He aspired to become the rival of Mohammed, and, by the charms of his versification, seduced a multitude of the Arabs to become his disciples. The governor of Emesa stopped the progress of the new sect by seizing their chief and dispersing his followers. Montanabbi, reduced to reason by confinement, renounced his chimerical pretensions to inspiration, and, on regaining his liberty, applied himself wholly to poetical composition. He was entertained at the court of the prince of Aleppo, whence he removed to Egypt, and afterwards to Shiraz, where he was loaded with benefits by the sultan Adadodowla. He was at length killed by robbers in crossing the desert to visit his native country in 965. A memoir of Montanabbi, with two of his poems, may be found in Ouseley's "Oriental Collections." His "Divan," a collection of poems, has exercised the industry of more than forty commentators.

**MOTTE, ANTOINE HOUDAR DE LA**, a French dramatist, who was born at Paris in 1672, and studied under the care of the Jesuits. His father, a hatter, who owned a small estate at Troyes, called *la Motte*, destined him for the law; but the son had a strong inclination for the theatre, and, after having appeared in some of Molière's plays at some private theatricals, he brought out his first piece, "*Les Originaux*," in 1693, with so little success that, from chagrin, he determined to join the Trappists. The celebrated abbé Bouthillier de Rancé, learning his resolution, dissuaded him and a companion, who meditated the same act of folly, from taking this step. La Motte returned to Paris, and began to write for the opera with more success. He brought out a great number of pieces, and was soon allowed to be inferior only to Quinault. He next ventured into the field of comedy and tragedy. Though some of his productions were unsuccessful, his tragedy, "*Ines de Castro*," met with a most favourable reception, notwithstanding its many faults. His Odes and Fables were also much admired. Having undertaken a translation of the *Iliad*, without a competent knowledge of the language, he involved himself in a dispute with Madame Dacier, on account of some remarks in his introductory essay derogatory to the merits of the poet. His "*Reflexions sur la Critique*," in reply to the violent work of Madame Dacier, "*Des Causes de la Corruption du Gout*," was written in a tone of moderation; the dispute was, however, continued until Fénelon, who was called in as arbitrator, decided the question; and Rousseau revenged the honour of the Grecian bard by a severe epigram on his detractor. Other paradoxical opinions—for instance, his objections to verse, although he had almost always written in verse, and with more success than in prose—involved him in numerous disputes, and drew upon him many epigrams. La Motte always kept his temper in those controversies,

and, although among the most admired writers of his day, never indulged in an acrimonious tone towards his adversaries. During the last twenty-four years of his life he was blind, and his health was very feeble; but he preserved his serenity and kindness of temper, and died in 1731.

**MOTTEVILLE, FRANCES BERTRAND, MADAME DE**, a celebrated French lady, who was born in Normandy about 1615. She was the daughter of a gentleman who belonged to the court; and her wit and amiable manners recommended her to Anne of Austria, who kept her constantly near her. Cardinal Richelieu, who was always jealous of the favourites of this princess, having had her sent from the court, she retired with her mother to Normandy, where she married Nicholas Langlois, lord of Motteville, who died in about two years. After the death of Richelieu, Anne of Austria, having been declared regent, recalled her to court. Her gratitude induced her to write the history of this princess, under the title of "*Mémoires pour servir à l'Histoire d'Anne d'Austria*." These memoirs describe the minority of Louis XIV. with great truth. She died at Paris in 1689. There was a very great friendship, even intimacy, between Henrietta, the widow of Charles I., and Madame de Motteville.

**MOULTRIE, WILLIAM**, a major-general in the revolutionary war of North America, who was born in England, but went to South Carolina at an early age. He served with distinction as a volunteer in the Cherokee war in 1760. He joined a second expedition under Colonel Montgomery, and in 1761 commanded a company in a third that forced the Indians into terms of peace. He was among the most strenuous in asserting the liberties of his adopted country against Great Britain. We find him associated with the Pinckneys, Rutledges, and Middletons, in the first stages of the contest, and sharing with them the confidence of his fellow-citizens. In the beginning of the war he was colonel of the second regiment of South Carolina, and a member of the first congress of that province. His defence of Sullivan's Island in 1776 with 344 regular troops, and a few militia, and particularly the repulse of the British in their attack upon the fort on the 28th June in that year won him much honour. He received the thanks of congress, and the name of Moultrie was bestowed on the fort. He was soon after raised to the rank of brigadier-general, and put upon the continental establishment. At Beaufort, in 1779, he repulsed the British at all points with a handful of militia; and he seconded Governor Rutledge efficaciously in collecting the yeomanry for the defence of Charleston, when the British general Provost made a demonstration against that place. About this time he received a commission of major-general in the army of the United States. His gallantry and conduct were signalized again in the battle of Stono, and in the pursuit of which he led as far as Sheldon. He was second in command under General Lincoln at Charleston, when the place was besieged and captured by Sir Henry Clinton. Moultrie remained a prisoner in the hands of the British until he was exchanged at Philadelphia, near the close of the war. On his return to South Carolina in 1782 he was hailed with the most cordial respect and gratitude by his fellow-citizens, who elected him governor of the state. He died at Charleston on the 27th of September, 1805, in the seventy-sixth year of his age. He compiled two volumes of "*Memoirs of the*

American Revolution as far as North and South Carolina and Georgia had a part." They consist chiefly of letters written by civil and military officers during the war. Major Garden has included in his "Anecdotes," &c., Moultrie's lofty reply to Lord Charles Montague, through whom brilliant offers were made to him, as temptations to desert to the British side.

MOUNIER, JEAN JOSEPH, a French advocate, was born in 1758 at Grenoble, where his father was a merchant. He was educated by a severe pedantic instructor, whose obstinacy and bad humour had exposed him to much suffering, and was afterwards refused admission into the military service because he was not of noble birth, so that he early imbibed a hatred against oppression and the privileged orders. Disliking the commercial profession, he devoted himself to the study of law at the university of Orange, and, after three years, became an advocate. At the age of twenty-five years he purchased the office of a judge-royal, which he exercised for six years with much reputation. His open declaration against the abuses of the stamp and land tax as they then existed in France, and against the mal-administration of the finances, gave one of the first impulses in 1787 to the general opposition to those oppressive measures; and when, in the following year, the severe and imprudent proceedings of the government occasioned disturbances in Grenoble the public voice selected him as umpire. In the first deliberations of the national assembly, of which he was a member, he was conspicuous. He took an active part in all the proceedings of the constituent assembly, and the resolution and honesty with which he conducted himself in the presidency of this body, under circumstances of great difficulty, protecting the interests of the nation, and repelling the unjust attacks on the royal family, secured him the esteem of the better part of the community. But when anarchy at length prevailed, and no hope remained of restraining the fierceness of unbridled passions, he retired from public life to Dauphiné, and thence, in November 1789, demanded his dismissal. At the same time he published an exposition of his conduct, "*Exposé de sa Conduite et des Motifs de son Retour en Dauphiné*." At Geneva, to which he afterwards retired to escape the persecutions of the Jacobins, he published the "*Appel au Tribunal de l'Opinion Publique*."

In 1793 he went from Switzerland to London, where government offered him the place of chief-justice in Canada, with a considerable salary, which, however, he refused, as he had not relinquished the hope of returning to his country; and Geneva, where he had till then resided, having been involved in the revolutionary disturbances, he retired to Germany with his family in 1795, where the duke of Weimar received him kindly, and gave him the castle of Belvedere, near Weimar, that he might establish there an institution for the education of young men from the higher ranks. Mounier here wrote his work "*De l'Influence Attribuée aux Philosophes, aux Francs-Maçons, et aux Illuminés sur la Révolution de France*," which appeared at Tübingen in 1801. After the 18th Brumaire he returned to France, was nominated in 1802 prefect of the department Ille and Vilaine, and in 1804 member of the conservative senate, and in the following year was made a member of the council of state. He died in January 1806.

MOUNTFORT, WILLIAM, a clever dramatic

writer and actor, who was born in 1659 in Staffordshire. He is believed to have adopted the stage as a profession at a very early period of life, as a contemporary says that after his attaining a degree of excellence in his profession, he was entertained for some time in the family of the lord chancellor Jefferies, "who," says Sir John Reresby, "at an entertainment of the lord mayor and court of aldermen, in the year 1685, called for Mr. Mountfort to divert the company," as his lordship was pleased to term it: "he being an excellent mimic, my lord made him plead before him in a feigned cause, in which he aped all the great lawyers of the age, in their tone of voice, and in their action and gesture of body, to the very great ridicule not only of the lawyers, but of the law itself; which to me," says the historian, "did not seem to me altogether prudent in a man of his lofty station in the law: diverting it certainly was, but prudent in the lord high chancellor, I shall never think it." After the fall of Jefferies he again returned to the stage, in which profession he continued till his death, which took place in 1692.

MOURADGEA, D'OHSSON, IGNATIUS, a learned American, who entered into the service of the Swedish embassy at the Ottoman Porte, and by his talents attained the highest diplomatic honours. He was made *chargé d'affaires*, knight of the order of Vasa, and in 1782 minister plenipotentiary and envoy extraordinary. His knowledge of the Arabic and Turkish languages gave him the means of acquiring information respecting the Ottoman empire from the best sources. He resolved upon writing a history of Selim II., but this was superseded by his plan of giving a full picture of the Ottoman empire. To this work he devoted himself with the greatest zeal and perseverance, and with great difficulty succeeded in collecting the first authentic information from a prejudiced, servile, and jealous people, respecting the national customs and habits, the interior of the seraglios, the mosques, and the private life of a Turk. With the materials which he had obtained, he proceeded to Paris in 1784, where he prepared his work for the press, and published it in 1788 and 1789, in two volumes, under the title of "*Tableau Général de l'Empire Ottoman*." This work completely answered the expectations which had been formed respecting it. The beauty of the typography and engravings occasioned an expense which exceeded the proceeds of the sale; but D'Ohsson, who possessed a large fortune, was willing to make sacrifices for the embellishment and perfection of his work.

The revolution interrupted his literary activity, and he returned to Constantinople. Selim III., who honoured knowledge, allowed the two volumes which were published to be presented to him, and, far from being displeased at the disclosure of some secrets, gave orders to facilitate the learned writer's researches by affording him the necessary information. After a long sojourn in Constantinople, D'Ohsson returned to Paris, where he found hardly any traces of his large property. Even the buildings where he had deposited the copies of his works, and the plates, drawings, &c., had been destroyed and plundered. Without suffering himself to be depressed by these misfortunes, he devised a still greater plan, which had in view a historical picture of the whole East, and became entirely absorbed in his desire to execute it. In 1804 he had completed two volumes of his

"Tableau Historique de l'Orient," when the war with Sweden made him apprehensive of another interruption. He asked and received permission from his government to retire to the country. Here he continued to occupy himself on his undertaking during three years, and gave the fruit of fifty-four years' labour to the world, in a work which contains, in three separate divisions, a complete view of the Ottoman empire. These three divisions have the separate titles, "Tableau Historique de l'Orient," a history of all the nations under the Ottoman government; "Tableau Général de l'Empire Ottoman," a view of the laws, religion, and customs, &c.; lastly, "L'Histoire de la Maison Ottomane," from Osman I. till 1758. The whole was nearly completed when interrupted by D'Ohsson's death on the 27th of August, 1807.

MOYLE, WALTER, a learned English writer, who was son of Sir Walter Moyle, and born in Cornwall in 1672. After he had made a considerable progress in his scholastic studies, he was sent to Oxford, and thence removed to the Temple. In 1697 he wrote, in conjunction with a Mr. Trenchard, a pamphlet entitled "An Argument Shewing that a Standing Army is inconsistent with a Free Government, and absolutely destructive to the Constitution of the English Monarchy." The same year, at the request of Dr. Davenant, he translated Xenophon's "Discourse upon Improving the Revenue of the State of Athens," and sent it to him to be annexed to his "Discourse on the Public Revenues and Trade of England." Moyle states to Davenant, in the dedication of his translation, that he "fancies it will be no unwelcome entertainment to him to find his own admirable observations upon these matters confirmed by the authority of one of the greatest men that ever antiquity produced, and the only ancient author upon this subject which is now extant. The admirable maxim, that the true wealth and greatness of a nation consists in numbers of people well employed, is every where inculcated throughout the whole course of this treatise; and "I believe," says he, "Xenophon was the first author that ever argued by political arithmetic, or the art of reasoning upon things by figures; which has been improved by some able heads of our own nation, and carried to the highest perfection by our own successful enquiries." With regard to the excellence of the translation, Davenant has given the following account of it:—"It was made English by a young gentleman, whose learning and ripe parts promises greater matter hereafter: since, in this first essay, he has shown himself so great a master, both in his own and the Greek language. And it is hoped this example will excite other persons of his age, rank, and fortune, to study the business of trade and the revenues of their country. The original is highly esteemed by all the learned world; and the reader will find Xenophon has suffered nothing in this version." He lived the latter part of his life at his seat in Cornwall, where he died in June 1721. In 1726 the works of Walter Moyle, none of which were ever before published, were printed in two volumes, and dedicated to his brother Joseph Moyle, by Thomas Sergeant, Esq. The first volume contains "An Essay upon the Constitution of the Roman Government, in two parts;" "A Charge to the Grand Jury at Lescard, April 1706;" "Letters to Dr. William Musgrave, of Exeter, upon Subjects of Criticism and An-

tiquity;" "A Dissertation upon the Age of Philopatrius, a Dialogue, commonly attributed to Lucian;" "Letters from and to Mr. Moyle upon Various Subjects." The second volume contains "Remarks upon Prideaux's Connexion of the Old and New Testament," &c.

In 1727 was published, by Anthony Hammond, a third volume, entitled "The Whole Works of Walter Moyle, that were published by himself." The editor complains that "when his posthumous works came from the press, these valuable tracts of his, which were printed in his life-time, and past his last hand, should be dropt, as it were, in oblivion, as they must have been, had they been covered in those volumes," wherein they were by himself originally interspersed: and observes, "that the principal intention of collecting them was to do justice to the memory of Mr. Moyle."

MOZART, JOHN CHRYSOSTOM WOLFGANG.—The history of music scarcely furnishes another composer of equal genius with this extraordinary man, or one whose works, in his own peculiar style of composition, have so well stood the test of time. He was born at Salzburg in 1756, and his musical studies commenced at three years of age. In the following year he could play most music at sight, and at five years old he began to compose original pieces. The energy of his mind enabled him easily to fix his attention on any new object that presented itself. Music, however, soon became his favourite pursuit; and his taste for it gained such an ascendancy over him that he gave himself up, without reserve, to the occupation nature had apparently prescribed for him. His progress never slackened. Mozart, the father, upon returning one day from church with a friend, found his son occupied in writing. "What are you about there, my dear?" he demanded. "I am composing a concerto for the harpsichord; I have almost finished the first part." "Let us see this scrawl." "No, if you please, I have not yet finished it." His father however took the paper, and showed it to his friend; it was a perfect scrawl of notes, hardly legible from the blots of ink. The two friends began to laugh heartily at this scribbling; but Mozart's father, having considered it attentively, "See, my friend," said he, "how exactly it is composed by rule; 'tis a pity we cannot make out something of this piece; but it is too difficult, nobody could play it." "It is a concerto," replied the young Mozart, "and should be well studied before being performed. See, this is the way you should begin." He then commenced playing it; but only succeeded in the performance sufficiently to discover his idea. Indeed, the composition was a multitude of notes placed exactly according to rule, but which presented such amazing difficulties, that the most able musician would have found it impossible to execute them with facility.

When he had attained the age of six years, all Mozart's family, consisting of his father, mother, sister, and himself, removed to Munich. Here the elector heard the two children perform, who received unbounded applause. In the autumn of this year he was presented at the imperial court. The celebrated Wagenseil happened to be in Munich. Young Mozart, who already preferred the approbation of a good master to that of any other, begged the emperor to allow Wagenseil to be present at his performance. Francis I. desired Wagenseil might be called, and re-

signed to him his place at the harpsichord. "Sir," said the young virtuoso, then six years old, "I am going to play one of your concertos; you must turn over the leaves for me." One day performing again at court, the emperor Francis I. said in a joke to the young performer, "It is not very difficult to play with all the fingers: but to play with one finger, and with the notes hid, would indeed excite admiration." Without the least appearance of surprise at this strange proposal, the child immediately began to play with one finger, and with all the precision and neatness imaginable. He then begged to have a veil that he might hide the notes of the instrument; and thus he continued to play equally as well as if he had long been accustomed to this style of performance.

Hitherto Mozart had merely performed on the harpsichord; but his great genius outstripped all instruction. He had brought with him from Vienna to Salzburg a small violin, and he was in the habit of amusing himself with this instrument. Wenzl, an able violinist, presented himself one day to Mozart, the father, to ask his opinion of six trios he had just composed. It was agreed that they should be tried, and that the elder Mozart should play the bass, Wenzl the first violin, and Schachtner, trumpeter to the archbishop of Salzburg, who happened to be with Mozart at that moment, the second; but the young Mozart entreated so earnestly to be permitted to take this last part, that his father, though at first much offended by his importunity, at the intercession of Schachtner, at length consented to let him perform on his little violin, assisted by his friend Schachtner. The father had never before heard his son's performance on this instrument; but his admiration was scarcely exceeded by his astonishment when Schachtner, laying aside his violin, declared he was entirely useless. The child executed with equal success all the six trios. Each succeeding day discovered fresh proofs of the talents of this extraordinary child. He could distinguish and point out the slightest variation of sound; and every false, or even harsh tone, not softened by some harmony, was torture to him.

Since his first trial on the violin, he frequently made use of that of Schachtner, which he admired much for the softness of its tone. One day Schacht-

ner came to visit Mozart, the father, and found young Wolfgang performing on his own little violin. "What is your violin about?" was the first remark of the child to Schachtner, and he then continued to play some trifling airs. At length, having reflected some moments, he said to Schachtner, "Why did you not leave me your violin tuned to the same pitch as it was the last time I used it? It is half a quarter of a tone lower than this one of mine." They at first laughed at this extreme exactness; but Mozart, the father, who had frequently occasion to observe his son's singular memory for retaining sounds, desired Schachtner's violin might be brought, and to the astonishment of all present, it actually proved to be half a quarter of a tone below that of the child's.

In July 1763, when Mozart had just attained his seventh year, his whole family left Germany. The fame of the young musician had then spread through Europe. He had already excited the greatest admiration at Munich, and successively at all the electoral courts. In the month of November he arrived in Paris, and was introduced to play the organ at Versailles, in the king's chapel, and in the presence of the whole court. His success in France, as well as that of his sister, almost amounted to enthusiasm. A portrait of his father, standing between himself and sister, was engraved after a design of Carmontel.

In 1764 he left Paris for England, where he was received with universal approbation. The two children then began to perform concertos, written in dialogue, on separate harpsichords. Some of the most difficult pieces of Bach, Handel, and other masters, were also presented to the young Mozart, who performed them all at first sight with the greatest possible accuracy and in the strictest time. One day, in the presence of his majesty George III., he executed from a written bass alone a piece which formed the most enchanting harmony. At another time, Christian Bach, music-master to the queen, took the little Mozart on his knees, and played a few bars. Mozart then continued the air, and they thus performed an entire sonata with such precision that those who were present imagined it was played by the same person.

He returned to France in 1765, and in passing through that country he performed on the organ at most of the churches and monasteries, and from thence continued his journey into Holland, and at the Hague composed a symphony for a full orchestra on the occasion of the installation of the prince of Orange. Here the two children had a serious illness, which nearly proved fatal to them both. The Mozart family then returned to Paris for two months, after which they bent their steps towards their native country. Soon after their return to Munich the elector proposed to the young Mozart a musical theme to develop. He immediately obeyed in presence of the elector, and, without the assistance of any instrument, wrote out the music, and afterwards performed it, to the great admiration of the court and all present.

In 1768 the children performed at Vienna in the presence of the emperor Joseph II., who ordered young Mozart to compose the music to the opera buffa entitled "La Finta Semplice." It was approved both by Hasse and Metastasio, but was never performed. At this time it not unfrequently occurred that at the houses of the chapel-masters, Bono and Hasse, Metastasio, the duke of Braganza, the prince de Kaunitz, &c., the father would beg that an Italian

or any other melody might be given to his son, when young Mozart would immediately subjoin all the instrumental parts in presence of the whole assembly. At the consecration of the church belonging to the Orphans' House, he composed the music of the mass and of a motet; and though, then only twelve years of age, conducted this musical solemnity in presence of all the imperial court.

In December 1769 he went with his father into Italy, having some months previously to his departure been nominated concert-master to the archbishop of Salzburg. He first exhibited his talents at Milan, principally at the house of Count Firmian, governor-general. Nor was he permitted to leave Milan till after he had engaged to return and compose the first opera for the carnival of 1771. He likewise excited equal admiration at Florence, in which city he became acquainted with Thomas Linley, who was then about his own age. Linley was a pupil of Martini, the celebrated violinist, and performed on that instrument with equal grace and skill. The friendship of these two boys soon became excessive. The day of their separation Linley gave his friend Mozart a copy of verses which he had requested of the celebrated Corinna on that occasion; he accompanied the carriage of Mozart to the gate of the town, where they parted, both bathed in tears. He arrived at Rome in the Passion-week, and on the Wednesday evening went with his father to the Sixtine chapel to hear the celebrated "*Miserere*," a composition of which it had been prohibited either to give or take a copy on pain of excommunication. Aware of this prohibition, the boy listened so attentively, that on his return home he noted down the whole piece. On Good-Friday the same "*Miserere*" was again executed. Mozart was again present, and, during the performance, held his musical manuscript in his hat, by which means he was enabled to make the necessary corrections. This anecdote created a great sensation in Rome. Soon afterwards, Wolfgang was requested to sing this "*Miserere*" at a concert, accompanying himself on the harpsichord. The first soprano, who had sung it at the chapel, was present, and acknowledged with surprise that Mozart's copy was both complete and correct.

From Rome the Mozarts continued their journey to Naples, where, performing on the piano one day at the Conservatorio della Pietà, the audience suddenly took it into their heads that a ring which he wore on his finger contained a charm; and at length, to pacify their doubts, he was obliged to take off the ring. The effect on this superstitious people may be imagined, when, having parted with the talisman, Mozart's music continued to be equally imposing. The pope now created him knight of the golden spur. In repassing through Bologna he received a still more flattering distinction. After the requisite proofs of his talent, which he offered to all with unusual promptitude, he was named, by universal consent, a member of the philharmonic academy. An anthem for four voices was then given him to compose, according to the idea formed of his talents; as was customary on such occasions, he was shut in a room alone, where he concluded his task in half an hour. A previous engagement now recalled him to Milan, otherwise he would have obtained what was then considered the greatest honour to musicians that could be conferred in Italy, namely, that of composing the first opera seria for the theatre at Rome.

In his fifteenth year he produced his "*Mithridate*," a serious opera, which had a run of twenty representations. To judge of its success, it will be sufficient to state, that the manager immediately made a written engagement with him for the composition of the first opera for the year 1773. This opera was called "*Lucio Silla*," which was equally successful with that of "*Mithridate*," and was performed twenty-six times in succession. During the period which elapsed between these two representations he quitted Milan to pass the few last days of the carnival at Venice; and at Verona, which he only passed through, they presented him with a patent, as member of the philharmonic society of that town. He also composed, in 1771, at Milan, "*Ascanio in Alba*;" and in 1772, at Salzburg, "*Il Sogno di Scipione*," for the election of the new archbishop of Salzburg. Being invited subsequently to Vienna, Munich, and Salzburg, he composed, amongst other works, the celebrated comic opera "*La Finta Giardiniera*." This was in 1775. He had now, it may be said, attained the highest perfection of his art, as his fame had spread from one end of Europe to the other; and, though only nineteen years of age, he could now make choice of any capital in Europe to establish himself. His father conceiving that Paris would be most suitable for him, in 1777 he commenced his second journey into France, accompanied by his mother. Here he had the misfortune to lose her, which rendered his residence in Paris insupportable; added likewise to the state of vocal music in that capital, which did not suit his taste, and thus obliged him to compose entirely for instruments. Having therefore produced a symphony at the spiritual concerts, and a few other instrumental pieces, he returned to his father at the commencement of the year 1779.

He next composed the opera of "*Idomeneo*," under the most favourable auspices, having been called to Vienna by the commands of his sovereign, the archbishop of Salzburg. Whilst there the elector of Bavaria requested an opera for the theatre of Munich. Mozart was then five and twenty, and being deeply in love with a young lady to whom he was afterwards united, love and ambition combined to exalt his genius to the highest degree, and he produced this opera of "*Idomeneo*," which he always considered as among his best, and from which he has even borrowed many ideas for subsequent compositions. From Munich, Mozart went to Vienna, where he entered the service of the emperor, to whom he remained attached the rest of his life; and though he was but indifferently treated, persisted in refusing many more advantageous offers which were made to him on the part of other sovereigns.

It was Joseph II. who desired Mozart to set to music "*The Marriage of Figaro*." He obeyed, and this opera was performed at Prague the whole of the winter of 1787. Mozart went that winter himself to Prague, and there composed for the Bohemians his opera of "*Don Giovanni*," which met with still more brilliant success than even "*The Marriage of Figaro*." The first representations of "*Don Giovanni*" were not very well received at Vienna. Its merits were one day discussed at a large assembly, where most of the connoisseurs of the capital were assembled, and amongst others, Haydn, Mozart not being himself present. Every body agreed in considering it a work of great merit, brilliancy, and richness of imagination;

but each found something to blame. All had given their opinion, with the exception of Haydn. At length they begged he would do so likewise. "I am not capable of judging in this dispute," he replied with his usual modesty; "all that I know is, that Mozart is certainly the greatest composer now in existence." Mozart acted at all times with the same generosity towards Haydn.

The death of this great genius took place on the 5th of December, 1792, before he had obtained his thirty-sixth year. Indefatigable to the last, he produced in the concluding few months of his life, his three *chef-d'œuvres*—"The Enchanted Flute," "Clemenza di Tito," and a "Requiem," which he had scarcely time to finish. It was during the composition of the first of these operas that he began to be subject to fainting fits. He was particularly partial to his opera of "The Enchanted Flute." The state of debility in which he was precluded the possibility of his leading the orchestra more than the first nine or ten representations. When he was no longer able to attend the theatre, he would place his watch by his side, and appeared to follow the orchestra in idea: "There is the first act over," he would say; "Now they are singing such or such an air," &c.; and then a fit of melancholy would seize him, and he fancied that he should not long enjoy life.

A singular incident accelerated the effect of this fatal presentiment, and as this incident was the occasion of his composing his celebrated "Requiem," one of his *chef-d'œuvres*, we shall enter into a few details concerning it.

One day when Mozart was immersed in a profound reverie he heard a carriage stop at his door. A stranger was announced, who begged to speak to him; a middle-aged man, well dressed, and of a noble and imposing appearance, was then shown in. "I am commissioned, Sir," said he, addressing Mozart, "by a person of rank, to call on you." "Who is that person?" interrupted Mozart. "He does not choose to be known," replied the stranger. "Very well; what does he wish?" "He has just lost a friend who was very dear to him, and whose memory he must eternally cherish; and, intending to celebrate her death by a solemn service every year, wishes you to compose a Requiem for the occasion." Mozart was much struck at the grave manner and tone of voice in which this address was pronounced, and with the mystery which appeared to envelope this adventure. He promised to compose the Requiem. The unknown continued: "Exert all your genius in this work; you will labour for a connoisseur in music." "So much the better." "How long will you require to do it?" "A month." "Very well; I will return in a month. How much will you charge for the work?" "A hundred ducats." The unknown counted them immediately on the table, and disappeared. Mozart remained plunged for some moments in profound reflection; then suddenly demanded a pen, ink, and paper, and, notwithstanding the remonstrances of his wife, began to write. This rage for composing continued several days; he wrote almost the whole day and night, with increasing ardour as he advanced; but his health, already feeble, could not long support this enthusiasm, and one morning he fell senseless on the floor, which obliged him for a time to suspend his labours. Two or three days after, his wife endeavouring to divert his attention from the melancholy ideas which possessed it, he re-

plied quickly, "I am persuaded that I am composing this Requiem for myself; it will do for my funeral service." Nothing could dispel this idea from his mind. As he continued his work he felt his strength diminishing from day to day, whilst his score advanced slowly. The month he had requested being expired, the stranger one day suddenly re-appeared. "I have found it impossible," said Mozart, "to keep my word." "It is of no consequence," replied the stranger. "How much more time do you require?" "A month. The work has become more interesting than I imagined, and I have extended it to a much greater length than I had at first intended." "In that case it is right to augment the price; here are fifty ducats more." "Sir," said Mozart, more astonished than ever, "who are you, then?" "That has nothing to do with the subject; I shall return within the month." Mozart immediately called one of his servants and desired him to follow this extraordinary man, and find out who he was; but the awkward servant returned, saying he could not trace his steps. Poor Mozart now took it into his head that the unknown was not a being of this world, and that he had been sent to warn him of his approaching end. He applied with greater diligence than ever to his Requiem, which he looked upon as the most lasting monument of his genius. During this labour he frequently fell into alarming fainting fits. At length the work was finished before the month was quite expired. The unknown returned at the stated time, and claimed the Requiem—Mozart was no more!

We must now take a brief view of the principal works on which the celebrity of this great composer has been founded, "Idomeneo" and "Don Giovanni" were his favourite operas. He did not like to speak of his own works, and if he did, it was in as few words as possible. When an idea struck him, nothing could divert him from his occupation. He would compose in the midst of his friends, and passed whole nights in the study of his art. Sometimes he only just finished a piece in time for its execution; this occurred in the case of his overture to "Don Giovanni," which he composed the night preceding the first representation, and after the last general rehearsal of the opera had taken place. Some people have imagined they have discovered in this overture the passages where Mozart was overcome by sleep; and those where he suddenly awoke.

No musician ever embraced the art so extensively. He excelled in all styles, from the symphony to the dance; from operas to the most simple ballads. As a musical performer Mozart was one of the first pianists in Europe. He played with the most rapid execution, and his left hand was particularly correct and excellent. But his most brilliant and solid glory is founded upon his talents as a composer. His compositions are principally admired for the amazing fertility of the ideas, the clear and happy designs, and systems followed up with much dexterity, but in which the most profound science is never destructive of grace; his works are also remarkable for a new and ingenious arrangement of the orchestra and wind instruments. Lastly, he had an extraordinary talent for introducing into his accompaniments the richness of symphony combined with unrivalled expression, energy, and fancy.

A genius so brilliant could not fail to excite the most lively enthusiasm. Numbers of servile imitators endeavoured to follow his footsteps; but as is gene-

rally the case, the beauties of the model degenerated into errors in their hands. They have only succeeded in patching up heavy and common designs with endless trouble and pedantic affectation. They have, it is true, like Mozart, loaded their full pieces with the whole mass of instruments, but they have been unable to produce any great effect; and the vocal parts, equally dull and insignificant, are lost in the noise of the orchestra. They have forgotten that two things are essentially requisite to form a good composer—innate genius, and a style, resulting from well-directed study. Mozart has been accused of interesting himself in his own music alone, and of being acquainted with no other compositions. There is a little exaggeration in this reproach. His whole life was thoroughly occupied either in composing or travelling, so that he had little time to attend to the composition of others; but he approved with the greatest candour every thing that was really good: he was the enemy only of mediocrity in talent. He did justice to the most simple music, as long as there were some traits of originality or genius in it.

With regard to Mozart's opera of "Figaro," the first reflection that occurs is that the musician, governed by his natural sensibility, has changed into real passion the trifling incidents which, in Beaumarchais, amused the amiable inhabitants of the castle of Aquas Frescas. It is however a *chef-d'œuvre* of tenderness and melancholy, and absolutely exempt from all importunate mixture of majesty and tragedy: no piece in the world can be compared to the "Nozze de Figaro."

As to the opera of "Idomeneo," it may be safely affirmed to be unrivalled, as well amongst his own operas as amongst those of the finest composers. For the "Flauto Magico," it should be seen to form a correct idea of its beauties. It appears to be the sportive effort of a tender imagination, and does honour to Mozart's great talents. But the all-romantic imagination of Mozart appears at its zenith in "Don Juan," this faithful delineation of so many interesting situations, and all of which are wonderfully portrayed by the rich talents of the composer. He has triumphed most completely in the discordant grandeur of the music in the terrible reply of the statue; it conveys to the ear a horror equal to that of Shakspeare's most terrific passages.

MUDGE, THOMAS, an ingenious mechanic, who devoted a considerable portion of his life to the improvement of time-keepers. He was one of the persons employed by the board of longitude to examine the inventions of Harrison. He also obtained a reward from parliament for a chronometer of his own construction. Mr. Mudge died in 1794.

MUDGE, ZACHARY, a learned English divine, who was born in the city of Exeter, and, having completed his education, obtained the rectory of St. Andrew's, Plymouth, in addition to which he was appointed prebend of Exeter. His death took place in 1769. His son, John Mudge, was a physician of considerable talent, not only in his own profession, but also in other branches of science. In the "Transactions of the Royal Society" appeared a valuable essay on the best mode of constructing the mirrors of reflecting telescopes. This essay was rewarded with the Copleian prize medal. His death took place in 1793.

MUHLENBERG, HENRY ERNST, an American botanist, who was born in Pennsylvania in 1753.

He was educated in the common school of Philadelphia, and in April 1763, being ten years of age, he was sent to Halle with his two elder brothers, to finish his education in literature and the sciences, and to study theology. In 1770 he left the university, returned to America, after travelling through a considerable part of Germany and England, was ordained the same year by the Lutheran synod, and in 1774 appointed third minister and assistant to his father in the Philadelphian congregation. In 1780 he accepted a call from Lancaster, in which situation, as pastor, he devoted himself assiduously and most faithfully to his duties until the moment of his death, which occurred, by apoplexy, on the 23rd of May, 1815. He was a learned theologian, versed in the ancient languages and in oriental literature, and possessed considerable acquirements in medicine, chemistry, and mineralogy, but is best known as one of the most distinguished American botanists. In 1777, during the occupation of Philadelphia by the British, being a strenuous Whig, he retired to the country, where, relieved of professional duties, he commenced the study of botany, to which he enthusiastically devoted himself. He carried on from this time a correspondence with many of the distinguished naturalists of Europe, and with the principal cultivators of botany in America, and contributed much, by his letters and communications to the different learned societies of which he was a member, to promote the progress of natural science. In 1786 he was elected a member of the American philosophical society; in 1798, member of the *Naturforschender Freunde* in Berlin; in 1802, member of the philosophical and physical societies of Gottingen, and various other associations in Sweden, Germany, and elsewhere.

MUKANNA, ATAN HAKEM, an Arabian impostor, who was born in Khorasan, in 775. He pretended that the Spirit of God, which had been transmitted from Adam through Noah and all the prophets, rested on him. Being hard pushed by the caliph Mohammed I., he burnt himself, with all his treasures, in Sam. His followers were called Moveidites, and paid him divine honours.

MULGRAVE, HENRY PHIPPS, EARL OF.—This nobleman was born in 1755. He was educated at Eton, and originally intended for the law; but he changed his views, and entered the army in 1775, and distinguished himself in the American war. In 1776 he served in America, as aide-de-camp to General Knyphausen. By purchase and otherwise he attained the rank of lieutenant-colonel. On the peace with America he returned to England, and in 1781 he was elected M. P. for Totness in Devonshire. As a member of the legislature he entered fully into Mr. Pitt's system of politics. On the death of his elder brother, October 10th, 1792, he succeeded to the title and family estate. On the breaking out of the French war he was employed by government in a confidential mission. He succeeded; and having now the rank of colonel, he in 1793 repaired to Toulon, which had been surrendered to the English, and he served there until the place was evacuated. After his return he was created (August 13th, 1794) an English baron, and appointed governor of Scarborough Castle. About the same time he was appointed colonel of the thirty-first, or Huntingdonshire regiment of foot; which he commanded until his death. He afterwards served in Holland. Subsequently to that period he devoted himself to a political life, and be-

came a principal member of the Pitt, Perceval, and Liverpool administrations. In 1804 Mr. Pitt made him chancellor of the duchy of Lancaster; and in 1807 he was nominated first lord of the admiralty. These appointments gave him admission into the privy council, and the latter into the cabinet. Soon afterwards he was appointed lord lieutenant of the East Riding of Yorkshire. In 1812 he was removed from the admiralty to be master-general of the ordnance; and on the 7th of September in that year he was advanced to the dignity of Viscount Normanby, of Normanby, in the county of York, and earl of Mulgrave.

In 1818 his lordship resigned the office of master-general of the ordnance to the duke of Wellington; but, by special agreement, he retained a seat in the cabinet.

From the time of his retirement from office in 1818 his lordship had been in a declining state of health. He died at his seat, Mulgrave Castle, Yorkshire, the 7th of April, 1831.

**MULLER, CHARLES OTTFRIED**, a German writer, who was born at Brieg in 1797, and became professor at the Magdalen gymnasium at Breslau; in 1819 was made extraordinary, and in 1823 ordinary professor of philosophy at Göttingen. He also acquired great reputation by his ingenious and learned work, "*Geschichte Hellenischer Stämme und Städte*," a part of which has been translated into English under the title of "*The Dorians*." The text of the translation was revised by Muller, who made numerous alterations, corrections, and valuable additions, which render it in fact a new and improved edition of the work. His other works are, "*Liber Ægineticorum*," "*Orchomenos und die Minyer*," "*Prolegomena zu einer Wissenschaftlichen Mythologie*."

**MULLER, FREDERIC**.—This artist is usually called *Maler Muller*, or *Muller the Painter*. He was born at Creuznach in 1746, published a poem in his eighteenth year, and subsequently several collections of etchings which were remarkable for their originality and freedom. In 1776 he went to Rome, and studied the works of Michael Angelo, but without much success. Like many of those who imitate that master, in attempting to copy his grandeur he fell into an exaggerated style. As a poet he deserves more credit. At a time when German poetry had degenerated into a mere versified prose, Müller appeared among the great writers who gave a new impulse to German literature. His complete works were published at Heidelberg in 1811. The principal are, "*Niobe*," "*Faust*," and "*Genevieve*." They are characterized by richness of fancy, warmth of passion, and elevated delineation of character, though sometimes wild and disconnected. He died at Rome in 1825, in the eightieth year of his age.

**MULLER, JOHN GOTTHARD VON**, one of the most eminent engravers of Germany. He was born in Wirtemberg in 1747, and early displayed so much talent that the duke sent him to Paris in 1770. Here he studied engraving under the celebrated Wille, made a rapid progress, and was chosen member of the academy of arts. He was soon after invited to Stuttgart by the duke of Wirtemberg, as professor of the academy in that place, and there published the masterpieces by which he has become celebrated. His principal historical productions are, "*The Battle of Bunker Hill*," from Trumbull, and "*The Madonna della Sedia*" of Raphael. He was

particularly remarkable for the purity and softness of his burin. He died in 1830. His son, John Frederic William Muller, was born at Stuttgart in 1782, and was also a distinguished engraver. He received his education at the gymnasium in Stuttgart, and was instructed by his father in geometry and perspective. His attempts with the burin were successful beyond expectation, and, in compliance with the precepts and example of his father, he applied himself assiduously to the study of drawing. At the age of twenty years he went to Paris, and applied himself with such excessive ardour as to injure his health; he likewise practised oil-painting, and executed portraits from nature. While at Paris he engraved the *Venus of Arles* for the Musée Français, and a statue, *La Jeunesse*, for Robillard. The latter exhibited a wonderful skill in imitating the appearance and expression of marble on copper. In 1808 it was proposed to him by Rittner, a dealer in works of art, to engrave Raphael's "*Madonna del Sisto*," in the Dresden gallery; and, animated by the greatness of the undertaking, he determined to devote all his powers to its execution, and, previously, to study his art in Italy. In 1809 he returned from Italy, and entered, with his usual industry, upon his great work. In the mean time he executed several works, such as the portraits of Jacobi, Schiller, and Hebel, and the Adam and Eve, after Raphael. In 1814 he was appointed professor in the Dresden academy of arts; but his health began to fail, and he exhausted the last remains of his mental and bodily vigour in the completion of his favourite work. He died in 1816, without having seen a complete impression of his splendid production.

**MULLER, PETER ERASMUS**.—This German author was born in the city of Copenhagen in 1776, and has thrown much light on northern antiquities by his laborious and critical researches. Among his valuable productions are, his "*Sagabibliothek*," and "*Critical Inquiries into the Value of Historical Sources of Saxo-Grammaticus and Snorre Sturleson*." The former gives the contents of all the Icelandic sagas; the latter is a model of historical criticism. Besides these works, he wrote "*Treatises on the Golden Horn*," "*On the Origin and Decline of Historiography in Iceland*," "*On the Importance of the Icelandic Language*," and "*Ueber die Echtheit der Asalehre*;" he also edited "*The Copenhagen Literary Journal*," which, after 1821, appeared under the title of "*The Danish Literary Gazette*."

**MULLER, JOHN VON**.—This learned German writer was born at Schaffhausen in 1752. He was the son of a preacher and schoolmaster in that city, and was indebted to his maternal grandfather for the future bent of his mind. Before he had learned to read he had become familiar with the principal events of Swiss history through the conversation of the kind and enthusiastic old man. His diminutive size, shortness of sight, and delicate constitution, prevented him from engaging in the sports of his age, while his studious disposition and warm heart excited the hopes and won the affections of his elders. At the age of nine years he wrote a history of his native city; and to the ancient classics, which he began to read secretly in his thirteenth year, he was indebted for that love of liberty and moral grandeur, that clearness and method of thought, and elegance and energy of expression, which appear even in his school exercises. Being intended for the church,

he went to Göttingen in 1769, where his teachers were Michaelis, Walch, Less, and Miller; and his favourite studies, exegesis and ecclesiastical history. The influence of Schlözer soon induced him to renew his historical studies, the first fruits of which appeared in his "*Bellum Cimbricum*." On his return to Schaffhausen, Müller preached with success, and was appointed a professor of Greek in the gymnasium. Here he formed an intimacy with Charles Victor von Bonstetten, which gave rise to the admirable "*Letters of a Young Scholar to his Friend*." Bonstetten procured him the place of family tutor at Geneva, and the celebrated Bonnet afterwards received him into his house.

The years 1777 and 1778 were spent in excursions through Switzerland, in studying the sources of Swiss history and the ancient classics. During the winter of 1778 he delivered lectures on universal history. The substance of these lectures is given in the "*Twenty-four Books of Universal History*," which form the first three volumes of his works. The first volume of his "*History of the Swiss*" was published at Berne in 1780, and he soon after went to Berlin, where he published his "*Essais Historiques*." Although Frederic the Great received him with distinction, no provision was made for him, and he was disappointed in his expectations of obtaining a place in the academy; he therefore left Berlin, and became professor of history at Cassel. Here he produced his treatises, "*De l'Influence des Anciens sur les Modernes*," and "*De l'Etablissement de la Domination Temporelle du Souverain Pontife au 8me. Siècle*." In 1783 Muller returned to Geneva, and renewed his examination of the documents of the history of Switzerland. In 1786 he was invited to Mentz by the elector, with the post of librarian and court counsellor; and he here published a new edition of the first volume, with a second volume of his history. Some political treatises, which he published at Mentz, contributed to extend his reputation, and to raise him to higher dignities at the electoral court. In 1791 the emperor created him baron of the empire, with a patent of nobility. When Mentz fell into the hands of the French in 1792, Muller, who had no sympathies with the revolution, went to Vienna, and was made a member of the privy chancery of court and state. His pamphlets on the occasion of the separate peace of Prussia, "*Die Uebereilungen und der Reichsfriede*," and those entitled "*Die Gefahren der Zeit*," and "*Das sicherste Mittel zum Frieden*," are masterpieces of eloquence.

In 1800 he was appointed first keeper of the imperial library, and now found time to devote to his historical studies, which had been interrupted by his political duties and the troubled state of the country. In 1804 he left Vienna and went to Berlin, where he devoted himself entirely to his studies. Several treatises which he published on "*The History of Frederic II.*," on "*The Decline of Liberty among the Ancients*," &c., are contained in the eighth volume of his works. He was preparing materials for writing the history of Frederic the Great, when the battle of Jena put a stop to his labours. Napoleon had a conversation with him at Berlin, and treated him with much distinction. The genius and kindness of the emperor won his esteem, and in his discourse "*De la Gloire de Frédéric*," delivered before the academy, he spoke of him in favourable terms. This made Muller an object of suspicion in Prussia: he

was therefore more ready to accept a place at the university of Tübingen; but while on his way thither, received the information of his appointment as secretary of state to the kingdom of Westphalia, which post he entered upon with reluctance. He was finally permitted to resign it in 1808, and died in 1809. The first division of the fifth volume of his "*History of Switzerland*" was published in 1808. His complete works were published at Tübingen in 1810, &c., in twenty-seven volumes.

MULLER, WILLIAM, a German poet, born at Dessau in 1795, and studied at Berlin, where he directed his attention to historical and philological enquiries. The war of 1813 called him from his books, and he was present, as a volunteer in the Prussian army, at the battles of Lützen, Bautzen, Hanau, and Culm. In 1814 he returned to his studies at Berlin, and cultivated the old German poetry and literature. His early display of talents had induced his father, who was a mechanic in moderate circumstances, to allow him to follow his own inclinations; and at Berlin he had enjoyed the advantage of the instructions of Bockh, Buttman, Rühs, and Uhden. His journey to Italy produced his ingenious work "*Rom, Römer, und Römerinnen*," and on his return to Germany he became teacher of Latin and Greek in the newly established school at Dessau, where he was also appointed ducal librarian. In 1824 appeared his "*Gedichte aus den Hinterlassenen Papieren eines Reisenden Waldhornisten*," which displays great poetical merit. His "*Lieder der Griechen*," which appeared in 1825, celebrates with poetic fire the awakening of an oppressed nation, its struggle and its victory. His "*Lyrische Spaziergänge*" displays the same truth of nature, freshness and fire, and the same harmony of language, which characterize his other poems. He also contributed many critical papers to several German periodicals and encyclopædias, and his "*Hommerische Vorschule*" is a work of much learning. His "*Bibliothek deutscher Dichter des 17. Jahrhunderts*" is a valuable collection of the best lyric poems of that period. He died in 1827, and his works were collected in five volumes and published at Leipsic in 1830.

MULLNER, AMADEUS GOTTFRIED ADOLF, a celebrated German dramatist, who was born at Langendorf, near Weissenfels, in 1774, and educated at the university of Leipsic, and finally settled, in the practice of the law, at Weissenfels. His early studies had been extensive, particularly in mathematics and German literature; but for a time he devoted himself entirely to his profession, wrote several esteemed law treatises, and in 1805 was made doctor of law at Wittenberg. Several years later, a private theatre being established, principally at his suggestion, at Weissenfels, in which he appeared with great success in many parts, he was induced to write himself, and produced his "*Neunundzwanzigster Februar*." The favour with which it was received encouraged him to continue his labours; and his "*Schuld*," which was written the following year, made him known throughout Europe, and was translated into English, French, and other languages. These productions were the first of the dramas founded on fate, and owe their origin to Werner's "*Vierundzwanzigster Februar*:" at the same time they follow, though at a distance, the ancient tragedy. His "*King Yngurd*," and his "*Albaneserin*," were his next productions in this department. His comedies, some of

which were published in 1815, were less successful. From 1820 he ceased to write for the theatre, probably on account of the cold reception of his two last tragedies, and devoted himself to literary and dramatic criticism. He had already contributed numerous articles to several periodical works, but he then became himself an editor. From 1820 to 1825 he edited the "*Literaturblatt of the Morgenblatt*," and in 1823 conducted the "*Hekate*," which soon, however, fell through. In 1826 he established the "*Mitternachtsblatt*," which he edited till 1829. An edition of his works, edited by himself, was published at Brunswick, to which he added an eighth volume, under the title of "*Meine Lämmer und ihre Hirten*," occasioned by and setting forth his quarrels with his former publishers. He died in 1829. A selection of his writings has since been published by Professor Schutz, who has also written his life. As a critic, although often personal in his sarcasms, he was distinguished for his wit, judgment, and acuteness. As a poet, Mullner is deficient in invention and depth of feeling; but his language is rich, sparkling, and highly poetical, but too epigrammatic; and his imagery is brilliant.

MUNDAY, ANTHONY, a miscellaneous writer of some celebrity, who flourished towards the close of the sixteenth century. A contemporary author furnishes the following picture of his literary life:—

"Munday was first a stage-player, after an apprenticeship, which tyme he wel served with deceaving of his master, then wandring towards Italy, by his own report became a cosener in his journey. Comming to Rome, in his short abode there, was charitably relieved, but never admitted in the seminary, as he pleseth to lye in the title of his booke, and being very of well doing returned home to his first vomite, and was hist from his stage for his folly. Being therby discouraged he set forth a balet against plays, though (oh constant youth) he afterwards began again to ruffle upon the stage. I omit (continues this author) among other places his behaviour in Barbican with his good mistress and mother. Two things, however, must not be passed over of this boy's infelicitie, two several ways of late notorious. First, he writing upon the death of Everard Haunse, was immediately controled and disproved by one of his owne batche, and shortly after setting forth the apprehension of M. Campion was disproved by George (I was about to say Judas) Eliot, who, writing against him, proved that those things he did were for luker's sake only, and not for the truthe thogh he himself be a person of the same predicament, of whom I muste say that if felony be honesty, then he may for his behaviore be taken for a lawful witness against so good men."

Munday published a variety of works, but he is best known for his reprint, with additions, of "*Stow's Survey of London*." He died in 1633.

MUNDEN, JOSEPH SAUNDERS, an eminent comic actor, who was born in London in 1758, and intended for the medical profession; but an unconquerable predilection for the stage was the cause of his abandoning his more reputable calling, and the devoting of his talents, which were very considerable, to the stage. His reception at first was not very flattering, but he subsequently rose to great eminence, retaining his rank till he retired from the stage in 1824. His death took place in 1832.

MUNRO, SIR THOMAS, a distinguished military commander, who was born in Glasgow in 1761. He

was educated for the mercantile profession, but owing to a change in his father's circumstances he was sent to India, where he served in the British army with great distinction during the wars which were carried on against Hyder Ally and Tippoo Saib. In consequence of his general good conduct and ability he was knighted and made major-general and governor of Madras. He had long wished to return to his native country, but just as he had arranged his affairs for that purpose he died. This event took place in 1826.

MUNTER, BALTHASAR.—This ecclesiastic was born at Lubeck in 1734 and studied theology at Jena, and became preacher to the orphan asylum in Gotha in 1760, and afterwards to the German society of St. Peter in Copenhagen, where he died in 1793. His sermons are esteemed for their practical character. He was also the author of "*Geistliche Cantate*" and "*Geistliche Lieder*." Munter was appointed to prepare the unfortunate count Struensee for death, and wrote an account of his conversion, which was translated into almost all the European languages.—His son, Frederic Munter, bishop of Seeland and primate of the Danish church, was born at Gotha in 1762, and studied theology in the university of Copenhagen, and then spent two years at Gottingen. In 1783 he visited Italy and Sicily, resided some time in Rome, and returning to Copenhagen in 1788 was appointed extraordinary professor of theology, in 1790 ordinary professor in the university, in 1808 bishop of Seeland and knight of the Danebrog, and died in 1830. Among his numerous and learned works the most important are, his "*Description of the Two Sicilies*," "*Specimen Versionum Danielis Copticarum*" (from a manuscript discovered by him in Rome), "*Statutes of the Templars*," "*Religion of the Carthaginians*," "*Antiquarian Essays*," "*Miscellanea Hafnensia*," "*Ecclesiastical History of Norway and Denmark*," "*The Star of the Wise Men, containing Investigations into the Year of Christ's Birth*."—His daughter, Frederica Brun Munter, was born at Tonna in 1765, and is distinguished for her poetical and prose writings. In 1791 she travelled in France and Switzerland, and in 1795 visited Italy, whither she again returned in 1805, and spent several years in Italy and Switzerland. Her travels are described in her "*Episoden*," her "*Briefe aus Rom, &c.*" Her poems have also been published in three volumes.

MUNZER, or MUNTZER, THOMAS, a celebrated German fanatic, who was born at Stolberg in the Hartz. If the tradition that his father was illegally executed by a count is true, this circumstance may account for the direction which his feelings afterwards assumed. He probably studied at Wittenberg, where he received the degree of master. He was afterwards a teacher at Aschersleben, and preached for several years in different places, every where displaying a violent enmity to the papacy. Luther's doctrines began about this time to spread widely, and men's minds were roused to shake off the papal yoke, but at the same time the spirit of fanaticism began to spread abroad. Whilst Luther was shut up on the Wartberg, and Carlstadt was committing the greatest violences in Wittenberg, the sect of anabaptists was formed at Zwickau by Klaus Storch, a clothier, with whom Marx Stubner, Martin Kellner, and Munzer, associated themselves. They entered Wittenberg with their followers, but Luther attacked them with such force that both Storch and Carlstadt were

obliged to leave the city. Munzer promulgated his doctrines with more zeal and success at Altstedt in Thuringia, where he preached from 1523. He assailed the papacy and Luther with great violence, and excited the people to revolt against the authorities, particularly after they were forbidden to attend his preaching. He easily persuaded them that God would soon deliver Christendom from the yoke under which it groaned.

His followers increased so rapidly that Frederic, elector of Saxony, and John, duke of Weimar, summoned him to Weimar to answer for his conduct in 1524. Nothing further, however, was done than to direct the authorities of Altstedt to remove so dangerous a person from the city. Munzer disappeared, and was not heard from again for a year, when he made his appearance at Nuremberg. Not being allowed to remain there, he went to Schaffhausen, where he continued six months, and then returned to Saxony. In Muhlhausen he gained an entire ascendancy over the populace, deposed the city council, which forbade his preaching, and appointed a new one, permitted the pillage of the monasteries and of the houses of the rich, and proclaimed a community of goods. Another fanatic, by the name of Pfeifer, entered the Eichsfeld with his troop of plundering followers, and joined Munzer. This event, and the information that 40,000 peasants had assembled in Franconia, and plundered and burnt 150 castles of the nobles and more than twenty monasteries, inflamed his zeal. He roused his adherents in Frankenhausen, the mountaineers of Mansfeld, and the peasants at Muhlhausen, Langensalza, and Tennstedt, and prepared for the war, promising his followers that he would raise them all to the rank of nobility. Leaving Pfeifer governor in Muhlhausen, he proceeded with 300 chosen men to Frankenhausen, broke off the negotiations which had been opened with the count of Mansfeld, and rekindled the ardour of the towns' people. Frederic the Wise, elector of Saxony, was now dead, and his more energetic successor, John, associated himself with George duke of Saxony, Philip landgrave of Hesse, and Henry duke of Brunswick, and sent a force against the insurgents, who amounted to about 8000 men, advantageously posted on a height near Frankenhausen, and protected by a barrier of waggons. The princes attempted to effect the peaceable submission of the revolted, but Munzer would not listen to terms, and was totally defeated, after an obstinate struggle, on the 15th of May, 1525. The insurgents lost from 5000 to 7000 killed, and the survivors threw themselves into Frankenhausen. Munzer concealed himself in bed, feigning sickness, but was accidentally discovered, and being carried to Heldrungen, confessed his accomplices on the rack. Pfeifer, who attempted to flee from Muhlhausen, was also made prisoner. They were condemned, with twenty-four others, and executed at Muhlhausen. Munzer behaved with the greatest pusillanimity, and was unable even to pronounce the creed at his execution. After the decapitation his body was impaled and his head stuck upon a stake.

**MURAT, JOACHIM.**—This extraordinary soldier of fortune, who rose from the rank of waiter at an inn to the possession of an extensive kingdom, was born at Cahors in 1767. He was educated for the priesthood, but preferring a military life entered the regiment of Ardennes. Murat afterwards entered the guards of Louis XVI., but the progress of the revolution threw him out of employment, and he

as well as Napoleon became intimate in the streets of Paris during the march of events in that capital. In 1794 he was nominated colonel and general of brigade in succession, and began to be distinguished both by his zeal and his valour. At the battle of Mendovi, fought on the 17th of April, 1796, he charged at the head of the chasseurs, and contributed not a little to the brilliant victory that ensued. The commander-in-chief, instead of being jealous of the glory acquired on this occasion, mentioned his name and his actions with due eulogium in all the public orders and despatches. Bonaparte afterwards employed Murat on a variety of public missions, particularly one to the court of Turin, which by this time began to be greatly terrified at the success of the French arms. Soon after we find him more appropriately engaged at Paris, whither he had conveyed twenty-one standards, which had been taken from the enemy. He then set off for Genoa and entered into a negotiation with the doge, in consequence of which the Austrian minister was obliged to withdraw in compliance with his menaces. Having once more resumed his usual military occupations, we next hear of his commanding the vanguard of the army of General Vaubois. In this capacity he distinguished himself at the passage of the Mincio, and acquired great reputation by the attack on the entrenched camp at Mantua. Murat was then chosen to act against Wurmser, and on this occasion he was wounded while urged by his zeal to acquire new trophies in the cause of revolutionary France.

In 1798 his reputation had increased to such a magnitude that he was appointed to serve in a high station under Berthier, and finally nominated governor of Rome. Bonaparte soon after employed him to unite the Valteline to the Cisalpine republic; and when the expedition to Egypt took place, he embarked with his old friend in that desperate and impolitic undertaking, the object of which seems to have been to found a new empire and to acquire new glory in distant lands. Murat, who had now the rank and appointments of a general of division, distinguished himself on the banks of the Nile by the same impetuosity which he had displayed on the shores of the Mediterranean. It was then that his talents as a cavalry officer became conspicuous; for he not only successfully contended with, but constantly routed the Mamelukes, notwithstanding their great personal bravery. At length a new and unexpected scene occurred. Bonaparte, abandoning his army, suddenly resolved to return to France. On this occasion he selected a few officers to accompany him, and Murat, who was one of these, proved serviceable in no small degree to his friend and patron, whom he assisted in overturning the republican government.

Immediately after the revolution of November 1799, Joachim obtained the hand of Marie de l'Annonciade Bonaparte, and not only became brother-in-law to the first man in France, but also commander of the consular guard. A new war with Austria having led to a second invasion of Italy, he was nominated to lead the vanguard. This conspicuous employment afforded a fresh opportunity for distinguishing himself. Crossing the Cesia in pursuit of a flying enemy, he marched towards the banks of the Tesino, effected the passage of that river after a strenuous opposition, and arrived triumphantly at the gates of Milan, the keys of which were presented to him by the magistrates. Proceeding in his victorious career, he crossed

the Po at Nocetto, occupied Placentia, and seized on immense magazines appertaining to the enemy. At the celebrated battle of Marengo he had the whole of the French cavalry under his orders, and contributed not a little to the memorable victory that ensued.

In 1801 Murat obtained the sole direction of the army of observation, which was then in full march towards Ancona. The intent of this movement was to occupy the countries ceded to France by the armistice of Treviso, and to put his holiness in possession of those territories of which he had been despoiled. Murat, thus become the protector of the pope, instantly reinstated him in his dominions; while nearly at the same time he united the conquered provinces under the name of the Cisalpine republic, and installed the new government with unusual pomp at Milan in 1802. Joachim soon afterwards returned to France, and, by a singular instance of good fortune, was chosen to preside in the electoral college of the department of Lot, in which he had been born, and in which he had originally occupied so humble a station. In 1804 he was appointed governor of Paris, with the rank and honours of a general; and during the month of May of the same year he was elevated to the distinguished station of marshal of the empire. Soon after this, on February 1, 1805, Bonaparte, who had now assumed the dictatorship and become emperor, granted letters patent to his brother-in-law, by which he was declared a prince and grand admiral of France.

In the middle of 1805 Murat was appointed to a high command in the war against Austria, and crossed the Rhine near Fort Kehl, at the head of the French cavalry. He first occupied the avenues leading to the Black Forest, and then marched thence into Bavaria at the critical moment when General Mack, in a most disgraceful manner, surrendered the fortress of Ulm and the army within its walls. He afterwards pursued the retreating foe under the command of the archduke Francis, whom he obliged to surrender, and finally entered Vienna as a conqueror on the 11th of November, 1805. The celebrated battle of Austerlitz having rendered Bonaparte for some time master of Germany, he now found means to obtain the duchy of Berg for his brother-in-law. It was accordingly in his capacity of grand-duke and sovereign that he served during the campaign of 1806, and he is allowed to have contributed greatly to the victory of Jena on the 14th of October in the same year. In addition to this, he obliged a large body of Prussians, under the prince de Hohenloe, to surrender at Peenzlow.

After commanding the French forces for a short time in Spain, he repaired to Italy, and under the name of Joachim I. assumed the sovereignty of Naples. As Ferdinand IV. and his consort had not rendered themselves very dear to their subjects, this transfer of a diadem was at first viewed by the people without either murmur or reproach. It must also be allowed that the new king conducted himself with great policy, and displayed no ordinary degree of talent. He endeavoured to conciliate the affections of his new subjects by affecting to conform himself in all things to the customs, and even to the superstitions of the country.

Murat was next selected by Bonaparte to command the French cavalry in Russia, and on this, as on all other occasions, exhibited a degree of bravery

bordering on temerity. At the battles of Smolensko and Moscow, in particular, he reaped new laurels. During a retreat accompanied by all the horrors resulting from famine, disorder, and intense cold, the troops under his command for the first time experienced a check, notwithstanding which the army was solely indebted for its safety to him. On entering the confines of Poland, the wreck of this once mighty force was confided to the directions of King Joachim; but, to the surprise of every one, Eugene Beauharnois, the son of the ex-empress Josephine, was suddenly invested with the supreme command in consequence of an imperial decree, which contained a direct aspersion on the character of his predecessor. Immediately after receiving intimation of this event, Murat set out for Naples, and left positive orders behind that the Italian troops should return with all possible diligence to their native country, but from this moment his politics became vacillating and uncertain; and he treated with Austria, or intrigued with Bonaparte, precisely as the power of either became preponderant.

At length the new monarch threw off a mask so unconsonant with his character, and in consequence of a treaty concluded with the court of Vienna on the 11th of January, 1814, actually obliged the French army to fall back on the Adige. Yet still his conduct seemed indecisive, and his intentions ambiguous; for both varied in exact conformity to the good or bad fortune of the French emperor. At length Louis XVIII. having been seated on the throne of his ancestors, King Joachim withdrew his troops; yet he did not march them, as was expected, into the Neapolitan territories, but into that portion of the papal possessions which had been assigned him by the terms of the late negotiation. However, as the emperor of Austria now refused to guarantee these acquisitions, and as Joachim clearly perceived that he had become odious to the allies, he conceived the extraordinary project of revolutionising all Italy. Accordingly, at the very period when Bonaparte left Elba, and with an unexampled degree of good fortune arrived at Paris without firing a single musket, he sent a body of troops into the march of Ancona, and at the same time despatched the count de Beaufremont into France, with assurances of succour and support. A vain attempt to effect a general insurrection throughout Italy was followed by many popular acts on the part of the new government. Instead of levying imposts on his subjects as is usual with most other sovereigns in time of war, the king of Naples actually diminished all the taxes full one-third, and at the same time increased the number of his troops by all possible means. After assisting in person at two extraordinary councils he announced to his army "that the time had arrived to accomplish the high designs it was destined to fulfil;" and then named the queen regent. Immediately after this he sent two divisions of troops into the papal territories, by means of which he occupied the marches of Benevento and Ponte Corvo; while Pius VII. and his whole court instantly fled, first to Florence and then to Genoa. Murat next commenced hostilities against the Austrians by an attack on Casena, which he captured; and on the 29th of March, 1813, he entered Rimini, where he published a proclamation, by which he invited all the people to rise in arms, and at the same time declared Italy independent! Immediately after this the Neapolitan army, consist-

ing of about 50,000 infantry, and 10,000 cavalry, under the immediate command of the king, advanced on Placentia. This body of troops was directed against Bologna, Reggio, and Ferrara; and on entering the first of these a declaration was published in the name of "Joachim, the Italian Protector of Letters." Two columns were at the same time despatched against Florence, whither they arrived on the 7th of April, while a victory gained by Murat opened the gates of Modena to the invaders. As these successes tended not a little to favour the cause of Bonaparte, who had now rendered himself master of the capital of France, the English declared war against Naples; and the Austrians having rallied and assumed an offensive attitude, the situation of Murat from this moment began to appear critical and ominous. Accordingly Florence was abandoned, Casena evacuated, &c. An ineffectual attempt was made nearly at the same time to obtain a cessation of arms, while an alarming insurrection actually took place at Naples on the part of the Lazzaroni, who unanimously exclaimed "Morte a Joachimo!" This singular man, having been wounded during a sudden attack on Pesaro, was at length obliged to retire on Ancona, while the loss of the battle of Tolentino, in the beginning of May, completed the overthrow of his kingly power.

Murat entered Naples *incognito* during the evening of the 19th of May, accompanied by his nephew, who was colonel of the ninth regiment, and only four privates; he immediately proceeded to the palace, where he appeared, before the queen, pale and emaciated, in the uniform of a lancer. Embracing her, he said, "All is lost, Madam, but my life; that I have not been able to lose." He then took an affectionate leave of the queen, who, as regent, had been obliged to enter into a capitulation with Admiral Lord Exmouth, and then dressed himself in a plain grey suit of clothes; after which, accompanied once more by his nephew, he proceeded on foot to the sea-shore, opposite to Nisida.

His majesty remained at Ischia during three whole days without being known; and on the fourth, as he was walking on the sea-shore in company with his relative, the colonel of lancers, they discovered a small vessel approaching the spot where they were standing. Having first hailed her, Murat contrived to get on board by means of a fishing-boat; and to his great joy and astonishment, was instantly saluted by the duke of Roccoromania, his own master of the horse, who was also a fugitive. They had parted but a few days before, on which occasion his majesty had divided with them a considerable sum in gold, and acquainted them at the same time with his intention of repairing to Ischia for the purpose of obtaining a passage to France, where Napoleon once more reigned: and this indeed was the only country in Europe where he was likely to enjoy an asylum. As the flag of King Ferdinand was now flying near the very spot where they then were, it was determined to depart instantly. They accordingly set sail, and after a prosperous voyage landed at Cannes, a small port in the Mediterranean, in the department of the Var, situate between Frejus and Antilles, on the 28th of May, 1815. Immediately on their arrival Murat addressed a letter to Fouché, then the confidential minister of the emperor Napoleon, as he was afterwards for a time of Louis XVIII. Bonaparte, who was acquainted with all his negotiations with his enemies,

and fully aware at the same time that he was odious to the army in consequence of his conduct during the Italian campaign in 1814, which, by uncovering France on that frontier, had invited the invasion of the allies, would not permit the royal fugitive to approach nearer to the capital.

On the restoration of Louis XVIII. Joachim fled to Corsica, where he was received and entertained by a native of the name of Colonna, who possessed great influence, with an uncommon degree of hospitality. Of the immense wealth once possessed by Joachim, he had only carried 4000 napoleons from Naples, most of which had been distributed among his attendants. His sole riches now consisted of two epaulets and a hatband, both richly set with brilliants, and estimated at 10,000*l.*, which were the only portable articles of any value he could collect during the hurry of his departure from the palace. By the sale of these, however, he collected a few discontented officers, and assembled a small body of troops, many of whom had before served under his banners. Accordingly, with a devoted band of about 300 followers, Murat embarked on board his flotilla, without receiving any obstruction from a neighbouring fort, that commanded the port, although the white flag was actually waving from its battlements. They steered directly for Salerno; but the transports having been scattered by a storm, the ex-king next morning found himself at the entrance of the Gulf of Euphemia, entirely separated from the rest of the little squadron. His own felucca contained only thirty-one persons; but they were all veteran officers, among whom was General Franchetti. This little train, with their leader, who was on that occasion habited in a splendid uniform, landed within half a mile of the town of Pizzo. Joachim was soon recognised by a few soldiers, who were employed in guarding the coast, and these saluted him with enthusiasm. On arriving at the market-place, many of the inhabitants also hailed, and even prepared to join him, while the rest manifested a certain degree of hesitation and suspense. Having been supplied, however, with a sufficient number of horses, his forlorn band proceeded towards Monteleone. As Murat was proceeding on his march, he fell in with a colonel of *gens d'armes* called Trentacapelli, whom he invited to join his standard; but, after surveying his scanty train of followers, this officer very significantly observed, "That he would regard him as his sovereign whose flag he should behold flying on the castle of Monteleone." On his arrival at Pizzo, the colonel, who had been allowed to retire, immediately placed himself at the head of a strong party, and instantly set out in pursuit of Joachim, who had by this time got half way to the capital of Calabria. In consequence of a fatal and ridiculous confidence, the invaders now beheld the approach of the troops with emotions of joy, for they thought they were actually coming to volunteer their assistance. Accordingly, the commander advanced some paces, while his followers exclaimed, "Viva il Rè Gioachim!" But, to their utter surprise, they were answered by a volley of musquetry, after which a sharp and desperate conflict ensued. As it was utterly impossible, on one hand, to disperse such a large body of men, and it would have been highly imprudent on the other, to advance with this force in their rear, it was determined to retreat to the felucca. Accordingly, followed by General Franchetti, and about twelve more, Joachim rushed

through the thickest of his enemies, of whom he slew several with his own hand; while he at the same time discharged his last pistol in the face of Trentacapelli. The Calabrians were astonished at such an unexpected attack from a few adventurers; and Murat,—taking advantage of their consternation,—pushed forward, and actually reached the beach himself unhurt, but all the rest wounded. His escape would now have been inevitable, had not Captain Barbata, on hearing the firing, consulted his own safety, and by leaving the coast, abandoned the unhappy fugitive to his fate. In this desperate situation, the ex-king threw himself into the water, followed by his surviving companions; and seizing on a boat, instantly prepared to push off; but all their efforts were in vain as the little vessel happened to be a-ground! On this he proceeded to another, about twenty yards distant, but the owner turned the prow to the shore, while his comrade attempted to seize the undaunted leader, who instantly knocked him overboard by a single blow. The beach by this time was lined with his pursuers, but no one attempted to fire, or even to offer violence to the person of this extraordinary man. He stood, unarmed and unhurt, in the midst of the assailants; but at length, finding both persuasion and resistance alike useless, he was obliged to surrender himself into the hands of his enemies.

The intelligence of the capture of Murat was instantly conveyed by telegraph to Naples; and instant orders were received, with equal rapidity, by the officers who commanded in Calabria, to assemble a court-martial to sit in judgment on a man so lately recognised as their king. The trial, which was short, took place October the 1st, 1815, and Joachim received notice of his sentence with expressions of contempt and indignation. Deeming it incumbent on him, however, to die in the religion in which he had been educated, he received the sacrament from the hands of a priest. Then, after writing a most affectionate letter to his wife and children, he placed their portraits on his breast, and refusing either to sit on a stool which had been provided for the occasion, or to have his eyes covered by a bandage, he received the fatal volley with the most undaunted courage.

MURATORI, LEWIS ANTHONY, a voluminous Italian antiquarian writer and historian, who was born at Vignola, in the Modenese territories, in 1672. Having adopted the ecclesiastical profession, and received the order of priesthood, he obtained some preferment in the church. In 1684 he was made keeper of the Ambrosian library at Milan, and subsequently librarian and archivist to the duke of Modena. His literary productions are voluminous and valuable, but his fame principally depends on his labours as an editor of the works of others. His works fill forty-six folio, thirty-four quarto, and thirteen octavo, volumes. Among them are, "*Della Perfetta Poesia Italiana*," "*Antiquitates Italicæ Medii ævi*," "*Novus Thesaurus Veterum Inscriptionum*," "*Anecdota Latina*," "*Anecdota Græca*," and his great collection "*Rerum Italicarum Scriptores ab Anno 500 ad 1500*," of which the two supplementary volumes appeared after his death. He was also the author of "*Annali d'Italia*," and "*Dissertazioni sopra Antichità Italiane*." Muratori died in 1750.

MURET, or MURETUS, MARK ANTONY, a French grammarian, who received his name from a

village of the same name in the neighbourhood of Limoges, where he was born in April 1526. In his eighteenth year he taught languages at Villeneuve, and afterwards at Poitiers, Bourdeaux, and Paris. In the latter place an accusation of an infamous nature caused him to be thrown into prison. At Toulouse, where he had settled, after obtaining his liberation he taught jurisprudence for some time, when a second charge of a similar nature was brought against him, and in 1554 he was condemned to be burnt in effigy. He escaped to Padua, where, as well as at Venice, he continued to give public lectures till 1560, when he accepted an invitation given him by Cardinal Ippolito d'Este to Rome. In 1563 he began to teach Greek and Latin, with philosophy and civil law, at Rome. In 1576 he took the vows, became a member of the college of Jesuits, and died in 1785. His works, consisting of orations, letters, poems, sacred hymns, &c.; "*Variae Lectiones*," four disputations on the pandects, "*On the Origin of Laws*," "*Carmina Juvenilia*," &c., all written with much purity and elegance, were collected in 1727. Another edition appeared at Leyden in 1789.

MURILLO, BARTOLOMEO ESTEBAN.—This distinguished Spanish painter was born at Seville in 1618. He received his first instructions in the art from his relation, Juan del Castillo, but the latter having gone to settle at Cadiz, Murillo was obliged for subsistence to paint banners and small pictures for exportation to America. In that business he obtained full employment, and began to distinguish himself as an able colourist. He was still very young when he saw some works of Pedro de Moya, who was passing through Seville on his way to Cadiz, which being painted in the style of Vandyke, inspired him with the desire of imitating that great artist, under whom De Moya had studied shortly before his decease. The time he was able to avail himself of Moya's instruction was very short, and he resolved afterwards to repair to Italy for improvement; but his means were totally inadequate to meet the expenses of such a journey. Collecting, however, all his resources, he bought a quantity of canvass, divided it into a number of squares, upon which he painted subjects of devotion and flowers, and, with the produce of the sale of these, set out upon his journey unknown to his relations and friends. On his arrival at Madrid he waited upon Velasquez, his countryman, and communicated his plans to him. Struck with the zeal and talents of the young artist, Velasquez treated him with the greatest kindness, and diverted him from his project of the journey to Rome by procuring him full employment at the Escorial and in the different palaces of Madrid. Murillo returned to Seville in 1645, after an absence of three years. The following year he finished painting the little cloister of St. Francis, and the manner in which he executed it produced the greatest astonishment among his countrymen. His picture of the death of Santa Clara, and that of St. James distributing alms, crowned his reputation. In the first he showed himself a colourist equal to Vandyke, and in the second a rival of Velasquez. They obtained him a multitude of commissions, which procured him an independent fortune.

His success, however, never led him to be careless. He gradually perfected his manner by giving more boldness to his pencil, without abandoning that sweetness of colouring which distinguished him from

all his rivals, increasing its strength, and giving greater freedom to his touch. He enriched the churches and convents of Seville, and other cities, with numerous works. Having been invited to Cadiz to paint the grand altar of the Capuchins, he there executed his celebrated picture of the marriage of St. Catharine. As he was about to finish it he wounded himself so dreadfully on the scaffolding that he continued to feel the effects of the injury until his death, which took place at Seville in April 1682. To the greatest merit as an historical painter Murillo joined equal excellence in flowers and landscape. His works afford proofs of the perfection to which the Spanish school had attained and the real character of its artists; for, as Murillo never quitted his native country, he could not be influenced by any foreign style, and his originality of talent places him in the first rank among the painters of every school. He has neither the charming dignity of Raffaele, the grandeur of Caracci, nor the grace of Correggio; but, as a faithful imitator of nature, if he is sometimes incorrect in drawing, he is always true and natural, and the sweetness, brilliancy, freshness, and harmony of his colouring, make us forget all his defects.

MURPHY, ARTHUR, a dramatist of considerable talent, who was born in Ireland in 1727, and went at the age of ten to the college of St. Omer, where he remained six years, and on his return was employed in the counting-house of his uncle, who intended to make him superintendent of an estate in Jamaica; but his inclination being averse to this destination, he repaired to his mother, then resident in London. At first he accepted a situation in a banking-house, but was soon altogether engrossed by literature. In October 1752 he published the first number of the "Gray's Inn Journal," a literary periodical, and first essayed his dramatic powers in the farce of "The Apprentice," which was followed by "The Upholsterer." He soon after made an attempt as an actor in the character of Othello, and held an engagement with Foote for a single season, but then retired. On quitting the stage he determined to study the law, and was admitted a barrister by the society of Lincoln's Inn in 1757. In 1759 he produced "The Orphan of China," from the tragedy of Voltaire, and a variety of other productions of tragedy, comedy, and farce, for the groundwork of which he was generally indebted to some foreign original. Of these "The Grecian Daughter," "The Way to Keep Him," "All in the Wrong," and "Know Your Own Mind," still keep the stage. In 1788 he retired altogether from the bar, and occupied himself entirely for the press. In 1792 appeared his "Essay on the Life and Genius of Dr. Johnson," and in 1793 he published his translation of Tacitus, with historical supplements. In 1798 appeared his tragedy of "Arminius," and his warmth in favour of the then pending war obtained him a pension of 200*l.* per annum. He died in June 1805, in his seventy-eighth year. One of his latest works was a life of Garrick, and a translation of Sallust has appeared since his death.

MURRAY, ALEXANDER, a distinguished American commodore in the navy of the United States, who was born in Chestertown, Maryland, in the year 1755. He went early to sea, and at the age of eighteen commanded a merchant vessel in the European trade. At twenty-one he was appointed a lieutenant in the navy; but no vessel being in readiness to receive him, he solicited and obtained a correspondent

rank in the first Maryland regiment, under the command of Colonel Smallwood. His conduct in the battles of Whiteplains, Flatbush, and New York, was marked by the greatest gallantry. He was promoted to a captaincy, and served unremittingly and bravely to the close of the campaign of 1777. Sickness obliged him to withdraw for a time to his father's house; but as soon as he recovered he took command, at different periods, of several well-appointed letters of marque. In these he fought various desperate battles, that showed him an intrepid and skilful officer. After he had taken an English letter of marque of his own force, and had prisoners on board equal in number to his own crew, he was captured by an English fleet, but before long he was regularly exchanged. He then volunteered his services as a lieutenant on board the American frigate Trumbull, which had scarcely cleared the capes of Delaware, when, in the night, and during a terrible storm, she was attacked and taken by two British vessels of war. Lieutenant Murray was severely wounded in this sanguinary engagement. On his recovery and exchange he was selected as the first lieutenant of the Alliance frigate, commanded by Commodore Barry. In this ship he remained until the termination of the revolutionary war. He had shared in thirteen battles in the army and navy. When the new American government organized a navy, Captain Murray was one of the first officers recalled into service. The United States corvette, Montezuma, was assigned to him for the protection of the American trade in the American seas. On his return from the cruise public thanks for his conduct were given him by the president of the United States. He was promoted to the command of the frigate Insurgent, and soon afterwards transferred to that of the frigate Constellation. His next sphere of exertion was in the Mediterranean sea, to which he was despatched with a squadron to defend the American trade against the Barbary powers. Being attacked in his ship when alone, near the bay of Tripoli, by a squadron of Tripoline gun-boats, he dashed in among them, and, after a spirited action of more than an hour, drove them into their own harbour. Commodore Murray's last appointment was that of commander of the navy-yard in Philadelphia, a post in which he rendered important services, and gave universal satisfaction. His death took place on the 6th of October, 1821, at his seat near Philadelphia. He united to the highest firmness and resolution a remarkable mildness and serenity of temper. Few men were personally more beloved. His remains were interred with the highest honours.

MURRAY, ALEXANDER.—This extraordinary self-taught scholar was born at Ketterick, in the Highlands of Scotland, in 1775. His father was a shepherd, who taught him to read and write only; but by his own unassisted efforts he taught himself nearly all the modern and several of the dead languages. His acquirements at length procured him admission to the university of Edinburgh, where he was employed to superintend an edition of the travels of Bruce. In 1806 he was appointed assistant minister at Urr, and two years after was called to fill the chair of oriental languages in the university of Edinburgh. His death took place in 1813.

MURRAY, JOHN, a Scottish physician, who was educated at the university of Edinburgh. As an author he is best known by his "Elements of Che-

mistry," and "System of Materia Medica and Pharmacy." He died in 1820.

**MURRAY, LINDLEY.**—This American writer was born in 1745, and was the author of the most useful and popular grammar of the English language. He received the rudiments of his education at Philadelphia, in the academy of the society of Friends. In 1753 his father removed with his family to New York, where Lindley was placed at a good school. At an early age he entered a counting-house, being destined for the mercantile profession; but, having been severely chastised for a breach of domestic discipline, he privately left his father's house, took up his abode in a seminary at Burlington, New Jersey, and there contracted a love of books and study. When brought back, after some time, he prevailed upon his father to procure a classical tutor for him, under whom he applied himself with diligence and success. He now undertook the study of the law in the office of an eminent counsellor, the celebrated John Jay being his fellow-student. At the age of twenty-one he was called to the bar, and soon obtained practice. Shortly afterwards he married a lady, with whom he lived in the tenderest union for more than half a century. He was very successful and sedulous in his business as a lawyer until the war broke out between Great Britain and the colonies. About that time the decline of his health induced him to remove into the country about forty miles from New York. In this retreat he passed four years, and at the expiration of this time he was driven back to the city (then in possession of the British) by the necessity of procuring funds for the subsistence of his family. The profession of the law being no longer lucrative, he turned merchant again, and accumulated property enough to enable him to retire from business about the period of the establishment of American independence. He then purchased a beautiful country-seat on the banks of the river Bellevue, about three miles from New York; but a severe sickness subjected him to a general debility of the muscles, for the cure of which he was induced to go with his family to England. He intended to remain there only two years, but the local attachments which he formed, and his bodily infirmities, detained him for the rest of his life. He bought a very pleasant estate at Holdgate, about a mile from the city of York. Here, rendered sedentary by the weakness of his muscles, he devoted himself chiefly to reading and composition. His first book is entitled "The Power of Religion on the Mind," &c., and appeared in 1787. It was anonymous, gained much reputation, and has passed through nearly twenty editions. His grammar was first issued in 1795. It was greatly enlarged and improved in successive editions, and has not yet been surpassed or superseded. It is still, altogether, the best extant of the English language. It was succeeded by his "English Exercises and Key," intended to correspond with and illustrate the grammar, abridgments of which treatises were published in 1797, and met with an extensive sale, which they still maintain. His next work was a compilation, entitled "The English Reader," also extensively used. In 1802 he produced a French compilation of the same kind, entitled "Lecteur Français," and subsequently "An Introduction au Lecteur Français," and in 1804 an English spelling-book. He also published a "Selection from Horne's Commentary on the Psalms," and "The Duty and Benefits

of Reading the Scriptures." His publications were lucrative, and acquired public favour both in Great Britain and the United States. In 1809 he finished the interesting memoirs of his own life, printed since his decease. He lived upwards of sixteen years from that period a martyr to bodily infirmities and diseases, which he bore with the most exemplary fortitude and Christian serenity. He expired on the 16th of February, 1826, in his eighty-first year.

**MURRAY, WILLIAM VANS**, distinguished in the annals of American diplomacy and oratory, was born in Maryland about the year 1762. Having received a classical education, he came to London after the peace of 1783, and resided here three years as a student of law in the Temple. He published a pamphlet on "The Constitutions and Laws of the United States," suggested by the observations of Price, Turgot, and Mably, which was much commended. About 1785 he returned to Maryland, where he engaged in the practice of the law; but his general reputation and merits caused him to be soon called to the councils of his country. He was first elected a member of the legislature of Maryland. For upwards of six years he held a seat in the house of representatives of the United States. Few of that body equalled him in eloquence, or the other qualifications of a member of a deliberative assembly, and his name ranks with the most conspicuous in the legislative annals of that period. In 1797 he declined a re-election to congress, having too long neglected his private affairs. One of the last acts of General Washington, as president, was the appointment of Mr. Murray as minister plenipotentiary to the Batavian republic. The minister arrived at the Hague at a crisis when abilities, zeal, and address such as his were required to counteract the unfriendly influence of France over the Batavian government. He succeeded in preserving harmony between the American and Batavian republics; and the first advances to a reconciliation between the United States and France were made in the intercourse of the French *chargé d'affaires* at the Hague with Mr. Murray. Proposals being made for a direct negotiation, they were accepted by Mr. Adams, then president of the United States, who appointed Mr. Murray sole envoy extraordinary to the French republic for the purpose. Afterwards, Judge Ellsworth and Governor Davie were associated with him. The history of this negotiation is one of the most remarkable portions of the civil history of the United States. Mr. Murray assisted in making the convention, which was signed at Paris on the 30th September, 1800, between America and France. He returned to his station as minister resident at the Hague, and, in December 1801, to his own country. His health being much impaired, he retired to his seat in Cambridge, on the eastern shore of Maryland. A rapid consumption of the lungs was the cause of his death, in 1803, in the forty-second year of his age.

**MUSÆUS**, a celebrated Greek poet, supposed by some of the early writers to have been the son of Orpheus. According to the Arundelian marbles, he flourished about 1426 years before the Christian era. Virgil gives him a very high rank among the poets. He places him in a conspicuous situation in his Elysium, at the head of a sacred band, and in the character of the priest of Ceres. Very little is recorded respecting his personal adventures. He seems to have led a retired and religious life, officiating most

probably as a priest of some of those mysteries which Orpheus had introduced before him. Plutarch does not mention him among the ancient musicians, and he does not seem to have been much celebrated for his performances on the lyre. As his hymns were set to music, it is probable, however, that he sung them himself at the ceremonies in which he presided. Pausanias asserts that the eminence in the neighbourhood of Athens, called the Museum, was so denominated from the circumstance of his having been accustomed to retire thither for contemplation and poetical musing. He is said to have composed his hymns there, and to have been interred beneath it. He wrote hymns and prophecies, and left precepts in verse addressed to his son. He is said also to have sung the wars of the Titans. But his principal work was a poetical account of the creation, in which he seems to have embodied some ideas of religion and philosophy more refined than were commonly entertained by the Grecian theologians of after days. Musæus was an astronomer, and composed or enlarged a sphere; though, as Chiron is generally supposed to have invented the sphere, it is probable that Musæus only improved it. The work itself is evidently subsequent to the voyage of Jason, as that expedition is described upon it, and as the Argo was the first vessel constructed on any other than the circular form. The life of Musæus seems to have been calm and tranquil; and was probably spent in philosophic ease. Of his works nothing remains. Even in the time of Pausanias, as we are informed by that writer, a hymn to Ceres was his only genuine composition then in existence.

MUSÆUS, JOHN CHARLES AUGUSTUS, a popular German writer, who was born at Jena, and studied theology there. Richardson's "Grandison" was very popular at the time, and Musæus published a satirical parody, under the title of "Grandison the Second," which was well received. He was afterwards master of the pages at the court, and, in 1770, appointed professor in the gymnasium at Weimar. His next production was a satire on the extravagances of the physiognomists,—"Physiognomical Travels." His "German Popular Tales," his "Freund Heins Erscheinungen in Holbeins Manier," and a new series of tales, under the title "Straussfedern" (of which only the first volume was from his pen), are among his productions. He died in 1787.

MUSSCHENBROEK, PETER VAN, a celebrated natural philosopher, born at Leyden in 1692, studied in the university of that city, and entered upon the practice of medicine. Similarity of scientific tastes united him in 1717 in a close intimacy with the celebrated S'Gravesande, with whom he pursued his studies in natural philosophy. After practising his profession four years, Musschenbroek was appointed professor of philosophy and mathematics, and extraordinary professor of medicine at Duisburg, and soon acquired such a reputation that he was called in 1723 to fill the philosophical and mathematical chair at Utrecht, and in 1740 was invited to Leyden to occupy the place left vacant by the death of Wittichius. He died there, in 1761. His principal works are, "Elementa Physicæ," "Tentamina Experimentorum," "Institutiones Physicæ," "Compendium Physicæ Experimentalis." Musschenbroek rendered important services to science. His experiments and his calculations prove his sagacity and accuracy.

MUSGRAVE, SIR RICHARD, a celebrated Irish

politician and historian, who was born in 1758. He received a good education, and in 1781 entered the Irish parliament. Soon after the rebellion in Ireland he published a history of that unfortunate transaction, but the whole work was much coloured by his own political views, which were ultra loyal. So eager was the public to gratify its curiosity on this occasion, that the whole quarto edition, consisting of 1250 copies, was sold within the space of two months; another soon followed, and was exhausted, so that a third became necessary. To adopt the author's own words, "some obloquy and abuse have been levelled against this work;" but these were attributed, in his "Justification," to "the malice of the Jacobins of England and Ireland." The papists, too, were not forgotten; and so very hostile was he to this religious body, that he professes it to be his decided opinion that two religions cannot exist at the same time in his native island, as in Germany. In respect to the latter country, he observes, "They are all originally of the same stock or lineage, and the religious liberty of each is guaranteed by the treaty of Munster; so that the intolerant and ambitious designs of either against the other is completely repressed; but in Ireland, the hope of recovering the forfeited estates, and of separating her from England, constantly fomented by bigotry, keeps alive their hereditary hatred to the latter, and of course to the members of the established church, from their noted loyalty and attachment to the sister kingdom, and gives full play to the deleterious doctrines of popery, which the Irish priests never cease to foment. In short," adds he, "for these reasons, no parallel can be drawn between the popery of Ireland and that of any other country in Europe."

Sir Richard, doubtless, gave great offence, both in England and Ireland, by his "Observations on Whipping and Free Quarters," in which he was supposed not only to apologize for, but even to justify, the application of torture by way of obtaining evidence. In short, his conduct on this particular occasion was far from proving conciliatory, and accordingly he neither satisfied his friends nor his enemies. Indeed, the Irish government at length deemed it necessary to disavow all connexion with the author, and publicly disclaimed the idea of affording him either patronage or protection in future. As the former work, to which we again recur, is not only connected with the history of his native country, but constitutes a leading feature in the biography of our author, an analysis may not, perhaps, be here improperly annexed.

We are told in a prefatory discourse, that instead of the Christian religion being introduced into Ireland by Roman missionaries in the beginning of the fifth century, it was established there by certain disciples of the Greek church. The Irish clergy, indeed, had no connexion with, and did not submit to, the jurisdiction of the Roman pontiff until the year 1152; when Pope Eugenius sent, by Cardinal Paparon, four palli to the archbishops of Armagh, Dublin, Cashel, and Tuam; when the Roman ritual was substituted in the place of the Greek, which had been previously used in the Irish church; an undoubted proof that it was independent of the pope until that memorable epoch. "Our excellent primate, Usher," adds he, "proves this in a most unquestionable manner, in a learned treatise on the religion of the ancient Irish, well worth the perusal

of the natives of Ireland. As to celibacy, we know from Ware, that the four archbishops of Armagh who preceded Celsus, and Celsus himself, who died in 1159, were married; and not until popery was established at Cashel in 1172, was marriage interdicted. In the end of the twelfth and the beginning of the thirteenth century, a season of midnight ignorance in Europe, the Roman pontiff, who was regarded with superstitious reverence, claimed, and gradually acquired, a superiority not only of spiritual, but of temporal power over all the potentates of Europe, who considered his sanction as necessary to expiate the guilt of any crime, how heinous soever, or to promote the success of any adventure. For this reason Henry II. solicited Pope Adrian for a bull to give him the investiture of Ireland, and, in consideration of it, agreed to grant him a tax of one penny on each house in it, called Peter Pence. Adrian, in his bull, empowered Henry II. "to propagate in Ireland the righteous plantation of faith, and the branch most acceptable to God; which meant no more than that he should subject this kingdom to the dominion of the pope, which, it is remarkable, was the last country in Europe that submitted to the ambitious and rapacious designs of his holiness. At this day the Roman catholics deprecate the grant of Ireland to a foreign, and not a native prince. M'Geoghegan, although a Roman catholic, in his history exclaims against the transaction as a violation of the rights of nations, and the most sacred laws, under the specious pretexts of religion and the reformation of manners; and he boldly adds, "Could one suspect the vicar of Christ of such gross injustice? could one believe him capable of issuing a bull by which an entire nation was overturned?"

On this occasion Sir Richard Musgrave observes, "If the aboriginal Irish lament the settlement of the English in Ireland, all its loyal inhabitants have to deplore that they introduced popery into it, as it has been a constant source of disaffection, and has produced insuperable calamities in it. It is not the object nor the wish of the writer of the following pages," adds he, "to disparage Ireland, or its inhabitants; the former in point of soil and climate, the latter in their intellectual and corporeal powers, being deservedly esteemed among the finest works of the creation; but to evince the truth of that maxim, that an *imperium in imperio*, or two separate sovereign powers, civil and ecclesiastical, cannot co-exist in the same state without perpetual collision, producing discord and rebellion; and that the only remedy for the calamities attendant on such a state, is either the extinction of one power, or the milder procedure of incorporating with the other. The latter mode has been adopted in Ireland: abstract reason must approve, and experience will demonstrate, the measure to be founded in the truest wisdom."

Sir Richard Musgrave and his doctrines being exceedingly unpopular, he was attacked in his turn by writers of all parties. Protestants and catholics, both in England and Ireland, wished to render him odious; and he suffered much in the latter part of his life from these hostile attacks. Indeed, it would have occupied a large portion of the remainder of his existence to have read and to have answered the numerous books, pamphlets, and periodical essays in which he was daily assailed. To two of his adversaries, and two only, did he think fit to reply; they were both men of some rank and estimation in Ireland.

Sir Richard died at his house in Holles Street, Dublin, on April 7th, 1818.

MUSS, CHARLES, an enamel painter of considerable skill, who was born in 1779. His principal work is a Holy Family, after Parmegiano. Mr. Muss died in 1824.

MUSTOXIDI, COUNT ANDREW, a distinguished Greek scholar who was born at Corfu in 1785, and studied at Venice and Milan. His work on Corcyra, "Per servire all' Istoria Corcirese dai Tempi eroici al Secolo XII.," procured him the post of historiographer to the government of the Ionian Isles. In 1811 and 1814 appeared the first two volumes of his history of Corcyra, under the title of "Illustrazioni Corciresi." In 1816 he wrote an essay on the horses of St. Mark's, at Venice, in which he proves that they did not belong to the triumphal arch of Nero in Rome, but that they were brought from the island of Chios, and placed in the circus in Constantinople, in the time of the emperor Theodosius. On the erection of a university in his native country, he returned to Corfu to fill one of the chairs, and in 1827 accompanied Count Capo d'Istria from Geneva to Ancona and Corfu.

MUTIS, JOSEPH CELESTINO, a celebrated botanist, born at Cadiz in 1732, was assistant professor of anatomy at Madrid, and made botany the particular object of his attention. Having accompanied the viceroy Don Pedro Mesia de la Cerda to New Grenada, in the capacity of his physician, Mutis enriched his favourite science with the description of unknown plants in that region. We are indebted to him for the first accurate accounts of various sorts of cinchona, on which he published a treatise. He died in 1808.

MYLNE, ROBERT, an architect of considerable eminence, who is memorable as the builder of Blackfriars' bridge across the Thames, which was commenced in 1760 and completed in 1770. It was the first work of the kind executed in England in which arches approaching to the form of an ellipsis were substituted for semicircles, by means of which the roadway is brought much nearer to a level surface than in bridges constructed on the old plan. Mr. Mylne obtained the appointment of surveyor of St. Paul's cathedral, and was employed in the erection of many private edifices in various parts of the kingdom. He died in 1811.

MYRON, a celebrated statuary of Greece, who was peculiarly happy in imitating nature. He flourished about 442 years before Christ.

NABIS, a Spartan king, who lived about 200, B. C. This tyrannical monarch at first assumed the appearance of a just prince, but afterwards imitated, externally, the Asiatic despots. He was surrounded by an armed guard, and had a multitude of secret spies in his service. Every suspected person was immediately put to death or banished. He plundered Messina and Argos, and would have continued to extend his dominions still wider over Peloponnesus by artifice and force, had not the Romans, in alliance with the Achæans, declared war against him. Quintus Flaminius was not able to conquer him, but Philopœmen, with the army of the Achæan league, was more successful. The tyrant was at last killed in Sparta by his own allies, the Ætolians, whom he had called in to his assistance.

NADIR, SCHAH, or THAMAS KOULI KHAN, king of Persia, a celebrated conqueror and usurper,

was born at Calot, in the province of Khorasan, in 1686. His father was governor of a fortress on the borders of Tartary, to which office he succeeded in his minority, under the guardianship of an uncle, who engrossed all the authority. He was subsequently kidnapped by the Usbecks, but escaped after a detention of four years; and in 1714 entered into the service of the beglerbeg of Muschadi, in Khorasan, where he so much distinguished himself by his bravery that he was entrusted with the command of a thousand cavalry, and was soon after placed at the head of an army, with which he gained a great victory over the Usbeck Tartars. This achievement excited so much jealousy in the beglerbeg that he gave the command to another person, and when Nadir remonstrated, ordered him to be bastinadoed. Irritated by this disgrace, he joined a band of robbers, and with this troop ravaged all the country, and, surprising Calot, put his uncle to death, although he had been previously negotiating with him to enter the service of Schah Thomas, king of Persia, then exceedingly pressed by the Turks and Afghans. Such was the bad posture of his affairs, that the schah felt himself compelled to overlook this villany, and take Nadir into his service, who repulsed both his enemies, and was honoured with the title of Thomas Kouli Khan. The schah, during his absence, having in person sustained a defeat from the Turks, was induced to make peace with them, and Nadir was directed to disband his army of 70,000 men. Instead of obeying, he immediately led them to Ispahan; where he seized the schah, confined and deposed him, and proclaiming his son Abbas, then an infant, in his stead, assumed the title of regent. He forthwith renewed the war with the Turks, and recovered all the lost provinces; and the young king dying in 1736, he was raised to the sovereignty.

This elevation only extended his views; and being invited by some conspirators about the person of the Great Mogul to undertake the conquest of India, he began his march at the head of 120,000 men, and with little resistance reached Delhi in March 1738. The riches which he found in this capital were immense; but being exasperated by some tumults on the part of the inhabitants, he caused a general massacre, in which upwards of 100,000 persons perished. After this barbarity the sanguinary victor concluded a peace with the Mogul, whose daughter he married, receiving with her as a dowry some of the finest provinces of the empire that were contiguous to Persia. In this expedition it is supposed that he carried away and distributed among his officers valuables to the amount of nearly 200,000,000 sterling. On his return he levied war against the Usbecks and others, but had nearly lost his life by an assassin instigated by his own son. In 1745 he defeated the Turks at Erivan. A conspiracy having been formed against him by the commander of his body-guard and his own nephew, he was assassinated in his tent on the 8th of June, 1747; his nephew, Ali Kouli, succeeding to the throne. This extraordinary usurper was of a tall stature and robust form, with handsome and expressive features.

NÆVIUS, CNEIUS, a celebrated Roman poet, who was born in Campania, and wrote tragedies and comedies after the model of the Greek school. He also wrote an epic poem upon the Punic war, and another in imitation of the Cyprian Ilias. He lived in the first half of the sixth century after the building of

Rome. By the introduction of some of the Roman nobility into his comedies, he provoked their anger, was banished from the city, and retired to Utica. Fragments only of his works have come down to us.

NAHL, JOHANN AUGUST, a clever German sculptor, who was born in 1710 at Berlin, and educated there under the celebrated Schlüter. After having made a tour through France and Italy, he returned to Berlin in 1741, where, and likewise at Potsdam, Sans-souci, and Charlottenburg, many of his works are still to be seen. In 1746 he went to Switzerland, and passed nine years in that country, principally at Berne. In 1755 Nahl was created professor in the academy of arts in Cassel, and there executed the admirable colossal statue of the landgrave Frederic, which stands in Frederic's Square. He died in Cassel, 1781.

NAHUM, one of the twelve minor prophets, whose prophecies relate to the destruction of Nineveh, which he describes in vivid colours. His object, according to some late German writers, seems to be to represent to his nation, groaning under the oppression which they had suffered from the Assyrians, the total destruction of the haughty capital, as a just punishment of Jehovah. The period in which he lived is, however, uncertain, some placing it before, and some contemporary with that event.

NALDI, SEBASTIANO, a celebrated Italian buffo singer, who visited London in the early part of the present century. Naldi met his death in Paris in 1819, by the explosion of an apparatus which had been invented for cooking by steam.

NALSON, JOHN, an English divine, who was born in 1638, and educated at Oxford. On his entering holy orders he obtained the living of Doddington, where he died in 1682. As a writer he is best known by his work entitled "An Impartial Collection of the Affairs of State, from the Scottish Rebellion to the Murder of Charles the First."

NAPIER, or NEPER, JOHN, BARON OF MARCHISTON, a distinguished mathematician, who was born in Scotland in 1550, and educated at the

university of St. Andrew's; after which he travelled, and on his return to Scotland devoted himself to the cultivation of science and literature. Being much

attached to astronomy and spherical geometry, he wished to find out a method of calculating triangles, sines, tangents, &c., shorter than the usual one. To the exertions arising out of this desire is to be attributed his admirable invention of logarithms, and the actual construction of a large table of numbers in arithmetical progression, in correspondence with another set in geometrical progression; the property of which is, that the addition of the former answers to the multiplication of the latter. The result of these important labours he published in 1614, under the title of "*Logarithmorum Canonis Descriptio*." He also made several improvements in spherical trigonometry, and was regarded by the celebrated Kepler as one of the greatest men of the age. The last publication, which appeared in 1616, was his "*Rabdologius seu Numerationis per Virgulas*," containing an explanation of the use of his celebrated bones or rods, with several other ingenious modes of calculation. He died at Manchester on the 3rd of April, 1617, in the sixty-eighth year of his age. Lord Napier was also author of "*A Plain Discovery of the Revelation of St. John*," and of "*A Letter to Anthony Bacon, entitled Secret Inventions*."

NARBONNE, LARA LOUIS. COUNT DE, was born at Colorno, a place in the duchy of Parma, in 1755, and went to France in 1760, where he was educated, entered the military service, and in 1785 was made colonel of the regiment Angoumois. He was afterwards employed in the war office, and having embraced the national cause in the revolution, was named commander of the national guards of the department of the Doubs. In 1791 he was appointed *maréchal de camp* by the assembly, and at the end of that year became minister of war. By his influence three armies were organized, under the command of Rochambeau, Luckner, and Lafayette. In 1792 he was removed from his post in the ministry, and he immediately joined the army. After the 10th of August he was outlawed, and owed his safety to the friendship of Mme. de Staël. Narbonne retired to England, and used every exertion to save the king. In 1800 he received permission to return to France, and in 1809 was named general of division. He was, not long after, appointed minister plenipotentiary to the court of Munich, and aide-de-camp of Napoleon. In this capacity he made the campaign of 1812, was sent ambassador to Vienna in 1813, and in the same year died at Torgau, of which place he had just been appointed commander.

NARDINI, PIETRO.—This musician was considered one of the first violinists of his time. He was born at Leghorn in 1725, studied under Tartini at Padua, and soon became the most distinguished pupil of that eminent artist. In 1762 Nardini was placed at the head of the chapel in Stuttgart, but returned to Leghorn in 1767, and composed most of his works after this period. In 1770 he went to Florence as first violinist in the chapel of the grand-duke of Tuscany, and died in that city in 1796. His compositions are of a grave character, and must be executed in the spirit of the Tartini school.

NARES, ROBERT, a theological writer, who was educated at Oxford, where he obtained his degree in 1778. Having entered holy orders he obtained several good church preferments, the last one was the rectory of All Hallows in London. He was also archdeacon of Stafford. He died in 1829. Among his numerous publications we may mention his "*Ele-*

ments of Orthoepey, containing a Distinct View of the Whole Analogy of the English Language."

NARSES, a celebrated eunuch of the court of the emperor Justinian I. at Constantinople. The place of his birth is unknown, but he so ingratiated himself with the emperor that he appointed him his chamberlain and private treasurer. In 538 he was placed at the head of an army destined to support the general Belisarius in the expulsion of the Ostrogoths from Italy, but the dissensions which soon arose between him and Belisarius occasioned his recall. Nevertheless, in 552 he was again sent to Italy to check the progress of Totila the Goth. After vanquishing Totila, he captured Rome. He also conquered Tejas, whom the Goths had chosen king in the place of Totila, and in the spring of 554 Buccellinus, the leader of the Alemanni. After Narses had cleared nearly all Italy of the Ostrogoths and other barbarians, he was appointed governor of the country, and ruled it fifteen years. During this time he endeavoured to enrich the treasury by all the means in his power, and excited the discontent of the provinces subject to him, who laid their complaints before the emperor Justinian II. Narses was deposed in disgrace, and sought revenge by inviting the Lombards to invade Italy, which they did in 568, under Alboin their king. After his deposition he lived in Naples, and died at an advanced age at Rome in 567.

NARVAEZ, PAMPHILA DE, a Spanish traveller, who was born at Valladolid, and went early to America, which was then just discovered. He served under Esquibal, governor of Jamaica, and was afterwards commander of the expedition sent against Cortes by Diego de Velasquez, governor of Cuba. He sailed in 1528 with 400 men, intending to establish a colony in Florida, discovered the bay of Pensacola, and having marched into the country, was never heard of more.

NARUSZEWICZ, ADAM STANISLAUS, a Polish poet and historian of eminence, who was born in 1733. He was descended from an ancient Lithuanian family, and entered in 1748 the order of the Jesuits. After a journey through Germany, France, and Italy, he was made superintendent of the *collegium nobilium* of the Jesuits at Warsaw. After the abolition of his order, the king engaged him in 1773 to write a detailed account of the first partition of Poland. His work, of which nothing has ever appeared in print, pleased the king so much that he encouraged him to write a complete history of Poland. This work is distinguished for its acute criticism, extensive reading, and concise and unadorned style, and is the most important that has ever appeared on the history of Poland. Unfortunately it is incomplete. The first volume, intended to embrace the earliest and most uncertain periods, and to be published after the other volumes, never appeared. Naruszewicz left a collection of materials for this work, in 360 folio volumes, extracted from public and family archives, and divided according to the years of the reigns of the different kings. They were put into the hands of Thaddeus Czacki, the author of an excellent work on the Lithuanian laws, who undertook to continue the history. As a poet Naruszewicz distinguished himself in several styles, particularly in the idyl. He also wrote a Polish translation of Tacitus, in which he has imitated the brevity of the original with surprising success; "*A Biography of the Lithuanian General, John Charles Chodkiewicz*;" "*Tauryka, or the*

*History of the Tartars,"* and other works. He died of a broken heart, occasioned by the fate of his unhappy country, at Warsaw in 1796, and was lamented both for his talents and his noble and philanthropic character.

**NASH, RICHARD.**—This celebrated scion of fashion was one of the most remarkable characters of the last century. He was born in 1674 at Swansea, in Glamorganshire, and was intended for the law, but entered the army; being disgusted at the discipline and his subordinate rank, he soon forsook it and took chambers in the Temple. Here he devoted himself entirely to pleasure and fashion; and when King William visited the inn, he was chosen master of the pageant with which it was customary to welcome the monarch. So pleased was William with the entertainment that he offered him the honour of knighthood; but Nash refused it, saying, "Please your majesty, if you intend to make me a knight, I wish it may be one of your poor knights of Windsor, and then I shall have a fortune at least equal to support my title." In 1704 he was appointed master of the ceremonies at Bath, and immediately instituted a set of regulations as remarkable for their strictness as for their judicious adaptation to the wants and society of the place. While in the plenitude of his power and popularity, Nash lived in the most splendid style, supporting his expenses by a long run of success at the gaming table. His dress was covered with expensive lace, and he wore a large white cocked hat. The chariot in which he rode was drawn by six grey horses, and attended by a long retinue of servants, some on horse, others on foot, while his progress through the streets was made known by a band of French horns and other instruments. His common title was the king of Bath, and his reign continued with undiminished splendour for more than fifteen years. His health then began to decline, and his resources grew less plentiful. As the change in his spirits and circumstances became more evident, his former acquaintances gradually forsook him, and he died at the age of eighty-eight, in comparative indigence and solitude.

**NASH, THREADWAY RUSSEL**, an antiquary of considerable research, who was educated at Worcester college, Oxford, where he took the degree of D. D. in 1758. In addition to a valuable church preferment he possessed an ample estate, which enabled him to devote the principal part of his time to antiquarian pursuits. His best work is modestly entitled "*Collections for the History of Worcester.*" Dr. Nash died in 1758.

**NASH, THOMAS**, a dramatist, who was born in the reign of Queen Elizabeth, and educated at St. John's college, Cambridge. After he had finished his education he came to London, and supported himself entirely by his pen. Among his numerous works was "*Pierce Penniless, his Supplication to the Divell.*" His death took place in 1601.

**NASMITH, JAMES**, an English writer, who was born at Norwich in 1740, and received his education at Cambridge. He was the author of a treatise on the statutes respecting the assize of bread, and also published editions of the "*Notitia Monastica,*" and "*Itineraries of Simon and William Worcester.*" He died in 1808.

**NASMYTH, PETER**, a clever Scottish landscape painter, who was a native of Edinburgh, and early devoted himself to the study of art. At the age of

twenty he came to London, where he spent the remainder of his life, and died on the 27th of August, 1831. He painted with so much skill as to be called the English Hobbima, that painter being his model, for without being a copyist he may be said to have infused the spirit of that master into his works.

**NAUNTON, SIR ROBERT**, an English statesman, who was educated at Trinity college, Cambridge. He was appointed master of requests by James I., and in 1617 was made secretary of state. He died in 1630, and after his death his posthumous works appeared under the title of "*Fragmenta Regalia.*"

**NAYLOR, JAMES**, a remarkable English enthusiast, who was born in 1616, in the parish of Ardsley, near Wakefield, in Yorkshire, where his father was a farmer. He possessed good natural parts, and upon the breaking out of the civil wars in 1641 he entered as a private soldier in the parliament army under Lord Fairfax, being then a presbyterian; though with the times he afterwards turned independent, and became quarter-master under General Lambert. In 1649 he returned home, and in 1651 was made a convert by the celebrated George Fox. He soon commenced preacher among that sect, and obtained considerable reputation for his talent as a speaker. On his visiting London in 1655 he gained a strong party in his favour, and in 1656 went into the west of England, to propagate the doctrine of his divine mission, and to such a height did the mania of his followers run that we find him addressed in the following impious words, for "the everlasting son of righteousness, and prince of peace, the prophet of the most high God, nay, the only-begotten son of God, out of Zion, whose mother is a virgin, and whose birth is immortal." In the mean time such extravagances excited horror, even in those days of fanaticism. Information was given to the magistrates, and Naylor was committed to Exeter gaol. He was not long detained in prison, being released in the ensuing month. He immediately came to London, resolving, however, to take Bristol in the way. He was attended by several of his adherents; who, in passing through Glastonbury and Wells, spread their garments before him in the streets. Being arrived at Bedminster, about a mile from Bristol, they formed themselves into procession; and when they came to the suburbs of Bristol, some females spread scarfs and handkerchiefs in his way, while others went on each side of his horse, and all joined in cavalcade singing, "Holy, holy, holy, Lord God of Sabaoth; Hosanna in the highest; holy, holy, holy, Lord God of Israel." Such a mockery of Christ's entrance into Jerusalem drew the notice of the magistrates, by whose order Naylor was apprehended, and committed to prison, with six of his associates; soon after which they were all sent to London to be examined by parliament. So unprecedented and unparalleled a case employed the house several days. He was first examined before a committee, who resolved "that James Naylor is guilty of horrid blasphemy, and that he is a grand impostor, and a great seducer of the people." After this nine days more were taken up in debates, when sentence was passed as follows: "That James Naylor be set on the pillory in Palace Yard, Westminster, during the space of two hours, on Thursday next; and be whipped by the hangman through the streets from Westminster to the Old Exchange, and there likewise be set on the pillory for the space of two

hours, between the hours of eleven and one on Saturday next; in each place wearing a paper, containing an inscription of his crimes; and that at the Old Exchange his tongue be bored through with a hot iron, and that he be there also stigmatized in the forehead with the letter B; and that he be afterwards sent to Bristol, and be conveyed into and through the said city on horseback, with his face backward; and there also publicly whipped the next market-day after he comes thither; and that from thence he be committed to prison in Bridewell, London, and there restrained from the society of all people, and there to labour hard till he shall be released by parliament; and, during that time, be debarred the use of pen, ink, and paper, and shall have no relief but what he earns by his daily labour." The whole sentence was put in execution, and, what is still more remarkable, it had the good effect of bringing him to his senses. He wrote a letter to the magistrates of Bristol, expressing his repentance, and he was discharged from prison by order of parliament in 1659; and, about the end of October 1660, set out from London, in order to return to his wife and children at Wakefield in Yorkshire. He was taken ill on the road, and carried to Holme, near King's Ripton, in Huntingdonshire, but he soon after expired, on the 7th of November, 1660. He was the author of several tracts, such as "Exhortation to the Rulers, the Preachers, and the Lawyers," "Milk for Babies," &c.

NEAL, DANIEL, a dissenting divine and historian, who was born in 1678, and educated at Oxford. He subsequently became eminent both as a preacher and writer, and died at Bath in 1743. His principal work is entitled "An History of the Puritans."

NECKER, JAMES.—This celebrated statesman was born at Geneva in 1732. He first distinguished himself by his "Eloge de Colbert," and by a treatise "Sur la Legislation et le Commerce des Grains," the latter passed through more than twenty editions. These and several other works of a similar character obtained him the post of comptroller-general, which, however, he afterwards lost; but so strong was the feeling of the nation on the subject that the king and court party, who considered him as unfavourable to them, were compelled to recall him. His talents, however, were not of a character to support him in the arduous task which he had undertaken, and shortly after his return he became as much an object of hatred as he had previously been of popularity. He left France, and was only protected from the fury of the Parisians by a decree of the national assembly. Mr. Necker then retired to Switzerland, and devoted the remainder of his life to literary pursuits. His death took place in 1804. The autograph of this distinguished financier is given beneath.

NEEDHAM, JOHN TUBERVILLE, an antiquarian writer, who was born in 1713, and educated at the college of Douai, where he made great progress in classical as well as in general literature. On his return he was elected fellow of the royal society, also of the antiquarian society, and various

other learned bodies. He assisted Buffon in some parts of his natural history, and himself published several valuable works. Among these we may mention his "Enquiries on Microscopical Discoveries and the Generation of Organized Bodies" as the best. He died in 1781 at Brussels.

NEELE, HENRY, a talented English writer, who was educated for the law, but subsequently turned his attention to literature. As an author he is best known by his "Romance of History," which is a work of considerable merit. He was also a poet, and many of his odes are remarkable for picturesque personification. This gentleman died by his own hand on the 9th of February, 1828, in a fit of insanity, which was brought on by mental exertion. In his private and domestic relations of life he was respected for his gentle and inoffensive disposition.

NEER, ARNOLD VAN DER, an eminent artist, who was born at Amsterdam in 1619. He excelled in painting views in Holland, cottages, or fishermen's huts, and in his beautiful delineation of the effect of moonlight. He was a perfect master of the *chiar-oscuro*. His sunsets are excellent, nor was he less successful in painting water pieces, in which he is only surpassed by Cuyp. He died in 1683. His son, Eglon Hendrick Van der Neer, was born in 1643, and was an historical and portrait painter. His pictures of conversations and gallant subjects are most admired, they are well coloured and highly finished. He was employed for some time by the elector palatine at Dusseldorf, where he died in 1703.

NELSON, HORATIO, one of the brightest ornaments of the naval profession, and one to whom Great Britain may be said to owe her present superiority on the ocean. He was born September 29th, 1758, at the parsonage-house of Burnham Thorpe, in Norfolk, where his father was then rector. Young Horatio was never strong, but yet he was remarkable for undertaking feats of agility and for exposing himself to dangers that few other boys would have ventured to attempt.

About his twelfth year, 1770, Horatio being at home for the Christmas holidays, read in the country paper that his maternal uncle was appointed to the *Raisonable*, of sixty-four guns. "Do, William," said

he to a brother who was eighteen months older than himself, "write to my father, and tell him that I should like to go to sea with uncle Maurice." Knowing it was the laudable wish of providing for himself that actuated his heroic son, and inwardly satisfied that "in whatever station he might be placed, he would climb, if possible, to the very top of the tree," Mr. Nelson, who had now repaired to Bath for the recovery of his health, did not oppose his son's design; but it was not considered in the same light by his uncle. "What," observed Captain Suckling, in his answer, "has poor Horatio done, who is so weak, that he, above all the rest, should be sent to rough it out to sea? But let him come, and the first time we go into action a cannon-ball may knock off his head, and provide for him at once." He accordingly went, and it was early on a cold and dark spring morning when the Rev. Mr. Nelson's servant came to the school at North Walsham, bearing the summons for Horatio to join his ship. Having parted from his brother William, and thus experienced the first of those privations which make up the sailor's lot through life, he accompanied his father to London; where he was put into the Chatham stage, in order to proceed for the *Raisable*, then lying in the Medway. Quitting the stage with the other passengers, he was left to find his way on board as he could, till after some time wandering about in the cold, without being able to reach the ship, an officer, observing his situation, questioned him, and happening to be acquainted with his uncle, took him home, and gave him some refreshments. When he got on board, however, Captain Suckling was not there, nor was any person apprized of the lad's coming; so that he paced the deck the whole of the day without obtaining notice from any one, nor was it till the ensuing day that somebody "took compassion on him!"

Owing to the termination of the dispute with Spain relating to the Falkland Islands, the *Raisable*, which had been commissioned on account of it, was soon paid off, and Captain Suckling was removed to the *Triumph*, of seventy-four guns, then stationed as a guard-ship in the Thames. Anxious for the welfare of his nephew, however, and deeming this too inactive a post for him, he sent him a voyage to the West Indies in a merchant ship, under Mr. Rathbone, an excellent seaman, who had formerly been master's mate with him in the *Dreadnought*. Nelson returned a good practical seaman, but with an aversion to the royal service. His uncle, perceiving the sentiment he had imbibed, endeavoured to counteract his dislike by holding out as a reward, that if he attended well to his navigation he should go in the cutter and decked longboat which was attached to the commanding officer's ship at Chatham: thus he became a good pilot, and acquired a confidence among rocks and sands, of which he often felt the importance. Nelson had not been many months on board the *Triumph*, when his enterprise was excited by finding that the *Racehorse* and *Carcass* bombs were selected and fitting out for a voyage of discovery towards the North Pole in consequence of an application from the royal society. Every sort of preparation being made, this expedition sailed from the Nore, June 4, 1773; Nelson being admitted as coxswain under Captain Lutwidge, second in command. Nelson was occasionally entrusted with the command of a four-oared cutter, which, owing to the

hazardous nature of the service, would have been committed to few boys of fifteen. During this perilous but interesting expedition there occurred one of those instances of the spirit of adventure that so strongly marked the career of Nelson. One night, pending the mid-watch, he stole from the ship, taking advantage of a rising fog, and, attended by one of his comrades, set out over the ice in pursuit of a bear. Presently they were missed; the fog also became more thick, and their officers felt seriously alarmed for their safety. Between three and four in the morning the weather grew clearer, when the two adventurers were seen at a great distance from the ship, attacking a huge bear. The signal for them to return was directly made; and Nelson's companion called upon him to obey it, but in vain: his musket had flashed in the pan, their ammunition was expended, and nothing but a chasm in the ice, which separated him from the devouring bear, had preserved his life. "Never mind," Nelson still cried, "do but let me get a blow at this devil with the butt-end of my musket, and we shall have him." Captain Lutwidge, however, seeing his danger, fired a gun, which had the intended effect of scaring the beast, and Nelson returned safe. The captain now severely reprimanded him for conduct so unbecoming his station in the ship, desiring to be informed what was his motive for hunting a bear? "Sir," answered the stripling hero, pouting his lip, as he was observed to do when agitated, "I wished to kill the bear, that I might carry the skin to my father."

Returning from this adventurous scene, and the ship being paid off shortly after their return, Nelson was placed by his uncle with Captain Farmer, in the *Seahorse*, of twenty guns, at this time attached to a squadron destined for the East Indies. He was stationed at the foretop at watch and watch, where his conduct attracted the attention of the master, afterwards Captain Surridge, upon whose recommendation the captain rated him as midshipman. Previous to this voyage his countenance had become florid, and he had begun to acquire a strong and athletic habit; but when he had been nearly eighteen months in India, he felt the effects of its climate so baneful to the constitutions of Europeans. Amidst the ravages of a disorder which at once reduced his strength and dejected his mind, and which, baffling the skill of medicine, left him no hope but in abandoning a scene where all was to him new and interesting, Nelson was favoured with one of those glimpses of futurity that but few have the privilege to experience, and still fewer the piety to appreciate. "I felt impressed," says the hero, "with a feeling that I should never rise in my profession. My mind was staggered with a view of the difficulties I had to surmount, and the little interest I possessed. I could discover no means of reaching the object of my ambition. After a long and gloomy reverie, in which I almost wished myself overboard, a sudden glow of patriotism was kindled within me, and presented my king and country as my patron. My mind exulted in the idea. Well then (I exclaimed) I will be a hero, and, confiding in Providence, I will brave every danger!" Thus did the immortal spirit of Nelson revive; for from that hour, "in his mind's eye," as he frequently expressed himself to Captain Hardy, "a radiant orb was suspended, which urged him onwards to renown." Nelson had too much devotional sensibility not to perceive the quarter whence he de-

rived this imparted hope; and long after, therefore, when his fame was co-extensive with that of his country itself, he spoke with rapture of the impulse thus communicated to his character.

Meanwhile his uncle, Captain Suckling, had been made comptroller of the navy: his own health had improved upon the voyage home, and he was shortly after appointed acting-lieutenant in the Worcester, sixty-four guns, Captain Mark Robinson. April the 8th, 1777, he passed his examination for a lieutenancy. Such was the honourable result of this examination to Nelson, that the next day he received his commission as second lieutenant of the Lowestoffe frigate, Captain William Locker, fitting out for Jamaica. While he was in this frigate, he captured, in a strong gale of wind and a heavy sea, an American letter of marque. Captain Locker ordered his first lieutenant to board her, but this, owing to a tremendous sea, he was unable to effect. "Have I then no officer," exclaimed the captain, "who can board the prize?" On hearing this the master immediately ran to the gang-way, in order to jump into the boat, when Lieutenant Nelson suddenly stopped him, saying—"It is my turn now; if I come back it will be yours." He accomplished his object, and probably never saw a difficulty in the course of his service that he did not surmount. Death at length deprived Nelson of his uncle, but in this conjuncture Captain Locker, who, duly appreciating his extraordinary merit, had formed a friendship for him, which terminated only with his own valuable life, warmly recommended him to Sir Peter Parker commanding on the West India station. Being by this means removed into the Bristol flagship he became first lieutenant; and on the 8th of December, 1778, was appointed commander of the Badger brig, lying in Montego Bay, Jamaica. Collingwood, then a lieutenant, succeeded his friend both in the Lowestoffe and the Bristol.

In 1779 Nelson was promoted to the rank of post-captain, and appointed to the Hinchinbrook of twenty-eight guns, an enemy's merchantman sheathed with wood. He was so far fortunate, notwithstanding his old forebodings, in possessing good interest at the time when it proved most serviceable to him; his promotion had hitherto been nearly as rapid as it could be, and before he had attained the age of twenty-one, he had gained that rank which brought all the honours of the service within his reach. No opportunity had, indeed, been afforded him of distinguishing himself, but he was thoroughly master of his profession, and his zeal and ability were acknowledged wherever he was known.

Early in the year 1780 Captain Nelson convoyed, in the Hinchinbrook, an expedition fitted out at Jamaica, and consisting of 500 men, to take Fort San Juan, on the river of that name; and, becoming thus master of the towns of Leon and Granada, to cut off the communication between North and South America. They reached the Rio San Juan on the 24th of March, when the captain's services were to have closed with the landing of the troops; but as no one had any knowledge of the river, Nelson, who would not turn his back where so much was yet to be done, manned two of his own boats and some Mosquito shore-craft, and resolved to carry the soldiers up to the fort. Besides the great difficulties attending the navigation, in a season most hostile to it, it was found indispensable to carry a small island in the middle of the river, and which

was defended by a battery. With an intrepidity that could not be resisted, Nelson, heading a few of his seamen, leaped upon the beach. The place on which he had precipitated himself was so muddy that he encountered much difficulty in extricating his feet, while he lost his shoes; but he would brook no delay, and advancing barefooted he "boarded the battery." The castle of San Juan surrendered after ten days' siege; yet owing to the desertion of the Indians, the terrible effects of the climate, and the total want of accommodation for the sick, the expedition ended most calamitously. Nelson was saved only by a timely removal, being seized with the prevailing dysentery.

On his return from this expedition Nelson was appointed to the command of the Janus of forty-four guns. He was so seriously reduced by his late disorder, however, that when they reached Port Royal he was carried on shore in his cot; and, notwithstanding some amendment, feeling that he was unable to retain his new command, he asked permission to return to England, as offering the only chance for his recovery. Captain (afterwards Admiral) Cornwallis took him home in the Lion, and to his care and kindness Nelson acknowledged himself to have been at this time indebted for the prolongation of his existence. Thinking he had recovered his strength, after an interval of about four months, he was appointed to the Albemarle, twenty-eight guns, a French merchantman, which had been purchased from the captors for the king's service. While employed in getting this ship ready he relapsed so seriously as to be hardly able to keep out of bed; yet in this state, suffering from the effects of a West Indian climate, he was sent to the North Seas, and kept there the whole of the winter! This was during the armed neutrality; and when they anchored off Elsinour the Danish admiral sent on board desiring to be informed what ships had arrived, and to have their force written down. "The Albemarle," observed Nelson to the messenger, "is one of his Britannic majesty's ships: you are at liberty, Sir, to count the guns as you go down the side; and you may assure the Danish admiral that, if necessary, they shall all be well served." It was in this voyage Nelson acquired that knowledge of the Danish coast, together with its soundings, which eventually proved of such advantage to his country, and of so much consequence to his own fame.

Nelson was shortly after ordered to Quebec. While cruising on this station, the Albemarle captured a fishing-schooner, which contained nearly the whole of her master's property, who, to add to his grief, was anxiously expected by a large family at home. Nelson, having first employed him as a pilot in Boston Bay, restored him the schooner and cargo, giving him also a certificate to secure him from being taken by any other vessel. Such an action was returned in kind. This man came off to the Albemarle, at the peril of life, with a present of sheep, poultry, and fresh provisions, which proved a most valuable supply, it being the middle of August and the ship's company not having partaken of a fresh meal since the beginning of April. The owner of the schooner preserved the certificate that had been given him at Boston, as a memorial of the generosity he had met with; and now that the fame of Nelson has given interest to every thing connected with his name it is regarded as a relic.

Captain Nelson sailed from Quebec with a convoy of transports to New York in October 1782, at a time when his sails were frozen to the yards, and arrived in safety at Sandy Hook. Admiral Digby remarking to him that he was come on a fine station for making prize-money, "Yes, Sir," replied Nelson, "but the West Indies is the station for honour." Lord Hood, with a detachment of Rodney's victorious fleet, being also at Sandy Hook, and having been intimate with Captain Suckling, introduced Nelson, whose professional worth was by this time extensively known, to his late majesty, then duke of Clarence, who was serving under himself as midshipman in the *Barfleur*. "I had," says his royal highness, "the watch on deck when Captain Nelson came in his barge along-side, who appeared to be the merest boy of a captain I ever beheld, and his dress was worthy of attention. He had on a full-laced uniform; his lank unpowdered hair was tied in a stiff Hessian tail of an extraordinary length; the old-fashioned flaps of his waistcoat added to the general quaintness of his figure, and produced an appearance which particularly attracted my notice; for I had never seen any thing like it before, nor could I imagine who he was, nor what he came about. There was, however, something irresistibly pleasing in his address and conversation, and an enthusiasm, when speaking on professional subjects, which showed that he was no common being." The duke, indeed, from that time became Nelson's firm friend, and had the gratification to find that his kindness was extended to an officer eminently worthy of it. When Nelson was ordered back to England, he was directed in his way to attend his royal highness on a visit to the Havannah.

Tidings arriving that the preliminaries of peace had been signed, the Albemarle returned home, and was paid off at Portsmouth, on the 31st of July, 1783. Nelson was now, for the first time, presented at court; after which he repaired to his friend Davison's chambers, at Lincoln's Inn, where he threw off his "iron-bound coat," previous to dining, and afterwards talked over whatever had befallen them since they parted on the shore of the river St. Lawrence. Having closed the war "without a fortune," he deemed it inexpedient to apply for a ship, because he was not wealthy enough to live on board in the style which was then become customary. Finding it prudent to economise on his half-pay, he repaired to France, towards the end of October 1783, in company with Captain Macnamara, of the navy, and remained there till the spring of 1784. He took lodgings at St. Omer's, where he was "quite at home," and seems to have felt more than ordinary delight in associating with "two very agreeable daughters" of an English clergyman, who were "about twenty years of age," and who played and sung to him and his companion whenever they visited them. "I must," writes Nelson to his friend Locker, "take care of my heart, I assure you." His gaiety was, however, not a little saddened by his receiving an account of the death of his favourite sister, Anne, who died in consequence of going out of the ball-room at Bath, when heated by dancing.

In March 1784 Nelson was appointed to the *Boreas* frigate, which had been ordered to the Leeward Islands, as a cruiser, upon the peace-establishment. His ship was full of young midshipmen, there being not less than thirty on board. "Well, sir," he would say,

whenever he perceived that a boy was apprehensive of going aloft at first, "I am going a race to the mast-head, and beg that I may meet you there." Nelson never noticed in what manner the nautical adventurer got up, but, when they met at the top, spoke cheerfully to him, remarking, at the same time, how much any one was to be pitied who fancied that getting up was either dangerous or difficult. He went into the school-room, day by day, to see that these youths were pursuing their studies: at noon, he was the first on deck with his quadrant; and some of them always accompanied him even on his visits of ceremony.

In 1787 Nelson married a widow lady named Nesbit, and he then took up his abode at the parsonage of Burnham Thorpe, which his father assigned for his residence. His pleasures were here rural ones. Sometimes he busied himself with farming the glebe; sometimes he spent the greater part of the day in the garden, which he digged as if to weary himself; and sometimes he went birds'-nesting, with his wife for his helpmate. Shooting, as he practised it, was, however, somewhat ominous to his companions; for he carried his gun upon the full cock, and, the moment a bird rose, he let fly, without ever putting the fowling-piece to his shoulder.

In 1793 Nelson was appointed to the *Agamemnon*, of sixty-four guns, and was shortly after placed under the orders of Lord Hood, proceeding to command in the Mediterranean. "There are three things," observed Nelson, at this time, to one of his midshipmen, "which you are constantly to bear in mind.—First, you must always implicitly obey orders, without attempting to form any opinion of your own respecting their propriety. Secondly, you must consider every man your enemy who speaks ill of your king; and, thirdly, you must hate a Frenchman as you do the devil." With these sentiments he embarked in the revolutionary war, and their effects were subsequently felt.

Before the British fleet had entered Toulon, in consequence of Lord Hood's negotiation with the inhabitants, Nelson was sent by him with despatches to Sir William Hamilton, our envoy at the court of Naples. This proved one of the eras of his most eventful life. Sir William, after his first interview with Nelson, told his lady that he was about to introduce a little man to her, who could not boast the advantages of person, but who, he believed, would one day astonish the world!—"I have never before," added Sir William, "entertained an officer at my house, but I am determined to bring him here. Let him be put in the room prepared for Prince Augustus." Sir William won as much upon Nelson's good opinion, who, delighted with his method of doing business, called him a man after his own heart; adding—"I am now only a captain, but I will, if I live, be at the top of the tree." Nelson as yet spoke of Lady Hamilton only in terms of general praise, considering her as a young woman of amiable manners, honouring the station to which she had been raised; and remarking, to his wife, that she had shown great kindness to her son Josiah. Having accomplished this mission, and returned from another to the dey of Algiers, Nelson was detached, with a small squadron, to co-operate with General Paoli and the patriotic party in Corsica. The confidence, indeed, which his admiral invariably reposed in him, manifested the conviction he had of Nelson's courage, and the high

opinion he entertained of his talents and ability to execute the very important services with which in succession he was entrusted. Whether batteries were to be raised, or ships cut out of harbours, or a hazardous debarkation was to be effected, or difficult passages were to be explored, we perceive Nelson foremost, together with his tried officers and seamen, upon every occasion. Thus placed in the post of observation, foremost in the hour of danger and difficulty, while, at the same time, his bravery was happily mingled with the most consummate prudence and profoundest judgment, it became matter of surprise if any official report of an encounter passed his name over in silence. He was, in short, entrusted as a negotiator, employed as a naval partisan and superintendent of transports, and as a general officer on shore.

During the memorable siege of Bastia, Nelson superintended the debarkation of the troops and stores, and commanded a brigade of seamen who served on shore at the batteries. With only a few artillerymen, about 1000 soldiers, and 250 sailors, he began his operations on the 4th of April; the sailors dragging the guns up the heights, and his handful of soldiers conducting themselves with a similar spirit. "Their zeal," Nelson observes, "is, I believe, almost unexampled. There is not a man but considers himself as personally interested in the event; and, deserted by their general, it has, I am persuaded, made them equal to double their numbers." It was not till the 19th of May that a treaty of capitulation was entered into; and on the following morning General d'Aubert arrived with his whole army to take Bastia. "I am all astonishment," said Nelson, "when I reflect on what we have achieved:—1000 regulars, 1500 national guards, and a large body of Corsican troops, 4000 in all, laying down their arms to 1200 soldiers, marines, and seamen! I always was of opinion, have ever acted upon it, and never had any reason to repent it, that one Englishman was equal to three Frenchmen." After this siege had been undertaken, and not till then, Nelson obtained information of the superiority of the garrison; but, with his accustomed fortitude, he kept the tidings within his own breast. "My own honour," writes he to his wife, "Lord Hood's honour, and the honour of our country, must have been sacrificed, had I mentioned what I knew: therefore you will believe what must have been my feelings during the whole siege, when I had often proposals made to me to write to Lord Hood to raise it." Now the identical persons who thus counselled him in this crisis were rewarded for their conduct at the siege, while Nelson himself, by whom Bastia was in fact taken, obtained no consideration.

Nelson was soon despatched to co-operate in another siege, that of Calvi, then conducted by General Sir Charles Stuart. Though he had here less responsibility than at Bastia, and was acting in conjunction with a commander like himself, the service was not less arduous than at the former siege. "I trust it will never be forgotten," said he, "that twenty-five pieces of heavy ordnance have been dragged to the different batteries, mounted, and all but three fought by seamen, except one artilleryman to point the guns." Here he was employed four months on shore, during what we term the dog-days, and the climate proved more destructive both to him and his brave men than the war. Of 2000 of his

comrades half were sick, and the rest like phantoms more than men; so that he compared himself to the reed among the oaks, bowing before the storm when they had first been laid low by it. "All the prevailing disorders have attacked me," declared our brigadier, "but I have not strength enough for them to fasten on me. One plan I pursue—never to employ a doctor. Nature does all for me, and Providence protects me!" It was at the siege of Calvi that he lost an eye; a shot struck the ground near him, and drove the sand and small gravel into his right eye. He spoke of it slightly at the time, and permitted it to detain him only one day from active duty, but the sight was gone for ever; yet, after the fall of Calvi, his services were so unaccountably overlooked that his name did not occur even in the list of wounded. Nelson felt this neglect. "One hundred and ten days," said he, "I have been actually engaged at sea and on shore against the enemy; three actions against ships, two against Bastia in my ship, four boat actions, and two villages taken, and twelve sail of vessels burnt. I do not know that any one has done more. I have had the comfort to be always applauded by my commander-in-chief, but never to be rewarded; and, what is more mortifying, for services in which I have been wounded others have been praised, who, at the same time, were actually in bed, far from the scene of action. They have not done me justice. But never mind, I'll have a gazette of my own."

Lord Hood left the Mediterranean in October 1794, when the command devolved on Admiral Hotham, who, receiving information that the Toulon fleet, consisting of seventeen ships of the line and five smaller vessels, had put to sea, immediately sailed in search of them. Hotham had with him fourteen sail of the line, and one Neapolitan seventy-four; but his ships were only half manned, containing not more than 7650 men, whereas the enemy had 16,900. He soon came in sight of them, and, after some severe fighting, captured several of the enemy's vessels.

Commodore Nelson was now constantly engaged in the most arduous services. Having been employed in the blockade of Leghorn, the taking of Port Ferrajo, with the island of Caprea, superintended the evacuation of Bastia, and at length joined the admiral in Fiorenza bay, he proceeded with him to Gibraltar. Though his name was but beginning to be known in his own country, he was already celebrated and respected over all Italy. There was sent him a letter directed "Horatio Nelson, Genoa;" and when the writer of it was asked how he came to address a letter so uncertainly? he justified the superscription by asserting that there was but one Horatio Nelson in the world! Indeed it was at Genoa, where he had been long stationed, that Nelson was most honoured both by the governor and the people. "Had all my actions," said he, writing at this period to his wife, "been gazetted, not one fortnight would have passed during the whole war without a letter from me." Activity was in fact his element. "Active service, or none," was one of his favourite observations; his ardent mind sustaining his feeble frame throughout these exertions, and enabling him to accomplish all that he so fervently anticipated.

During the month of December 1796, Commodore Nelson hoisted his broad pendant on board *La Minerve* frigate, Captain George Cockburne, and, accompanied by *La Blanche*, proceeded for Ferrajo, in order

to bring away the naval stores left there to Gibraltar. Falling in with two Spanish frigates on the night of the 19th, he instantly attacked the ship that carried the poop light, and ordered *La Blanche* to bear down and engage the other. At about half-past one, *La Sabina*, of forty guns and 286 men, commanded by Don Jacobo Stuart, struck to *La Minerve*. Captain Preston in *La Blanche* silenced the ship he had engaged, but, owing to three more of the enemy's ships heaving in sight, he could not effect possession. Nelson's letter to the admiral on this occasion has been admired as a model for naval despatches.—“You are Sir,” says he to Sir John Jervis, “so thoroughly acquainted with the merits of Captain Cockburne, that it is needless for me to express them; but the discipline of *La Minerve* does the highest credit to her captain and lieutenants, and I wish fully to express the sense I have of their judgment and gallantry. Lieutenant Culverhouse, the first lieutenant, is an old officer of very distinguished merit; lieutenants Hardy, Gage, and Noble, deserve every praise which gallantry and zeal justly entitle them to; as does every man in the ship. You will observe, Sir, I am sure, with regret, among the wounded, Lieutenant James Noble, who quitted the captain to serve with me, and whose merits and repeated wounds received in fighting the enemies of our country, entitle him to every reward a grateful nation can bestow.”

January the 29th, 1797, Commodore Nelson sailed from Porto Ferrajo. Impatient to rejoin his admiral, lest an engagement should happen before his return, he stopped only one day at Gibraltar, and fell in with the whole of the Spanish fleet off the mouth of the Straits; whence, however, he fortunately effected his escape, and joined Sir John Jervis off Cape St. Vincent, on the 13th of February, just in time to inform him of the force and state of the enemy, and shift his pendant on board the Captain, 74, R. W. Miller. Before sunset the signal was made to prepare for action, and to keep during the night in close order. The enemy's fleet was in sight at day-break. Before the enemy could form in order of battle, Sir John Jervis, by carrying a press of sail, came up with them, and, acting on the new system of tactics, passed through their fleet, then tacked, and so cut off nine of their ships from the main body. The admiral was by this manœuvre at liberty to attend entirely to the enemy's main body, still superior to him in point of number, and more so in weight. Sir John having made the signal to tack in succession, Nelson, who was stationed in the rear of the British line, perceived that the Spaniards were bearing up before the wind, either in order to reform their line, going at large, then joining their separated ships, or else aiming to elude an engagement; when, having at once resolved to prevent either of their schemes from taking effect, he assumed the responsibility of disregarding the admiral's signal, and ordered his own ship to be wore! “Passing between the *Diadem* and *Excellent* at a quarter past one o'clock,” said the commodore, on the 14th of February, 1797, off Cape St. Vincent, “I was engaged with the headmost, and of course leewardmost, of the Spanish division. The ships which I knew were—*Santissima Trinidad*, of 136 guns; *San Josef*, 112; *Salvador del Mundo*, 112; *San Nicholas*, 80; another first-rate, and a seventy-four, names unknown. I was immediately joined, and most nobly supported by the *Culloden*, Captain, Trowbridge. The Spanish fleet, not wishing, I sup-

pose, to have a decisive battle, hauled to the wind on the larboard tack, which brought the ships above mentioned to be the leewardmost and sternmost ships in their fleet. For near an hour, I believe (but I do not pretend to be correct as to time), did the *Culloden* and Captain support this not only apparently but really unequal contest, when the *Blenheim*, passing between us and the enemy, gave us a respite and sickened the Dons. At this time the *Salvador del Mundo* and *San Isadoro* dropped astern, and were fired into in a masterly style by the *Excellent*, Captain Collingwood, who compelled the *San Isadoro* to hoist English colours; and I thought the large ship, *Salvador del Mundo*, had also struck: but Captain Collingwood, disdaining the parade of taking possession of a vanquished enemy, most gallantly pushed up, with every sail set, to save his old friend and mess-mate, who was, to appearance, in a critical state. The *Blenheim* being ahead, the *Culloden* crippled and astern, the *Excellent* ranged up within two feet of the *San Nicholas*, giving a most tremendous fire. The *San Nicholas* luffing up, the *San Josef* fell on board her, and the *Excellent* passing on for the *Santissima Trinidad*, the Captain resumed her station abreast of them, and close alongside. At this time, the Captain having lost her fore-top-mast, not a sail, shroud, nor rope left, her wheel away, and incapable of further service in the line or in chase, I directed Captain Miller to put the helm a-starboard, and calling for the boarders, ordered them to board. The soldiers of the sixty-ninth, with an alacrity which will ever do them credit, and Lieutenant Pearson of the same regiment, were almost the foremost on this service. The first man who jumped into the enemy's mizen-chains was Captain Berry, late my first lieutenant (Captain Miller was in the act of going also, but I directed him to remain); he was supported by our spritsail-yard, which hooked in the mizen rigging. A soldier of the sixty-ninth regiment having broken the upper quarter gallery window, I jumped in myself, and was followed by others as fast as possible. I found the cabin doors fastened, and some Spanish officers fired their pistols; but having broke open the doors, the soldiers fired, and the Spanish brigadier (commodore, with a distinguished pendant) fell, as retreating to the quarter-deck. I pushed immediately onwards for the quarter-deck, where I found Captain Berry in possession of the poop, and the Spanish ensign hauling down. I passed with my people and Lieutenant Pearson on the larboard gangway to the fore-castle, where I met two or three Spanish officers, prisoners to my seamen; they delivered me their swords. A fire of pistols or muskets opening from the admiral's stern gallery of the *San Josef*, I directed the soldiers to fire into her stern, and calling to Captain Miller, ordered him to send more men into the *San Nicholas*, and directed my people to board the first-rate, which was done in an instant, Captain Berry assisting me into the main chains. At this moment a Spanish officer looked over the quarter-deck rail, and said they surrendered. From this most welcome intelligence it was not long before I was on the quarter-deck, where the Spanish captain, with a bow, presented me his sword, and said the admiral was dying of his wounds. I asked him on his honour if the ship had surrendered. He declared she had; on which I gave him my hand, and desired him to call on his officers and ship's company, and tell them of it; and on the quarter-deck of a Spanish

first-rate, extravagant as the story may seem, did I receive the swords of vanquished Spaniards, which, as I received, I gave to William Fearney, one of my bargemen, who put them with the greatest *sang-froid* under his arm. I was surrounded by Captain Berry, Lieutenant Pearson of the sixty-ninth regiment, John Sykes, John Thompson, Francis Cook (all old Agamemnon), and several other brave men, seamen and soldiers. Thus fell these ships." We must not omit to state that when Nelson had directed an additional number of men to be sent from the Captain on board the *San Nicholas*, he himself headed the assailants, exclaiming, "Westminster Abbey! or glorious victory!" Twenty-four of the Captain's men were killed and fifty-six wounded; one-fourth of the loss sustained by the whole squadron falling upon this ship. Nelson had himself received some bruises.

Still the Spaniards had eighteen or twenty ships, which, having been separated from the main body in the morning, had suffered little or no injury, while the English could not have formed without abandoning their captures, though Sir John Jervis had made signal to bring to, uncertain in what manner the enemy would act. After some consultation, however, the Spaniards declined renewing the battle. The action being thus discontinued, Nelson went on board the admiral's ship, who welcomed him on the quarter-deck, then embraced him, and declared that he could not sufficiently thank him. For this victory the commander-in-chief was rewarded with the title of Earl St. Vincent; and Nelson, who, before the intelligence of this engagement had arrived, was promoted to the rank of rear-admiral, obtained the order of the Bath. Other honours awaited him. Sir John Jervis insisting on his keeping the sword of the Spanish rear-admiral, he now presented it to the corporation of Norwich, the capital city of his native county, who accordingly voted him their freedom. He was also presented with the freedom of the city of London in a gold box. But of all the congratulations which he received on this occasion, none so sincerely delighted him as that which proceeded from his venerable father, who assured him that he thanked his God, with all the power of a grateful soul, for having so mercifully preserved him. "The height of glory," added his parent, "to which your professional judgment, united with a proper degree of bravery, guarded by Providence, has raised you, few sons, my dear child, attain to; and still fewer fathers live to see. Tears of joy have involuntarily trickled down my furrowed cheeks; who could stand the force of such general congratulation? The name and services of Nelson have sounded throughout the city of Bath, from the common ballad-singer to the public theatre." His respected father concluded by telling him that the field of glory was still open to him, and added his blessing.

April 1797, Sir Horatio Nelson hoisted his flag as rear-admiral of the blue, being detached to bring down the garrison of Porto Ferrajo; and on the 28th of May, having been appointed to the command of the inner squadron at the blockade of Cadiz, he shifted his flag to the *Theseus*. During the service, he was engaged in the most perilous action of his life; for, making a night attack upon the Spanish gun-boats, his barge was assailed by an armed launch, on the evening of July the 3rd, when he had no more than his customary complement of ten men and the coxswain, accompanied by Captain Freemantle. Don Miguel Tregoyen, the Spanish commander, in a barge

rowed by twenty-six oars and having thirty men, made a most desperate effort to overpower Nelson and his comrades, fighting hand to hand with their swords. Nelson's faithful coxswain, John Sykes, twice saved his life by parrying the blows that were aimed at him, mortally wounded his antagonists, and at last interposed his head to receive the stroke of a sabre that could not otherwise have been averted! Notwithstanding the disproportion of numbers in favour of the foe, eighteen of their men were killed, the rest wounded, and their launch taken; but Sykes, though he recovered from a dangerous wound, did not live long enough to benefit by the intended kindness of his commander.

About the middle of July, Sir Horatio was detached with a small squadron to attack the town of Santa Cruz, in the island of Teneriffe. "This night," writes Nelson, on the 24th of July, to the commander-in-chief, "I, humble as I am, command the whole force destined to land under the batteries of the town; and, to-morrow my head will probably be crowned either with laurel or cypress." Aware of the desperate nature of the service on which he was bent, he endeavoured to dissuade his wife's son, Lieutenant Nisbet, from accompanying him, but which happily, as events turned out, he had resolved to do:—"Sir," replied Nisbet, "I will go with you to-night if I never go again." In the very act of stepping out of the boat Nelson received a shot through the right elbow; yet, as he fell, caught the sword which he had just drawn, in his left hand. This sword was a bequest of Admiral Walpole on his death-bed, who stated, as his reason for so bequeathing it, that it was the sword he carried when he lost his arm in vanquishing the enemies of his country; and it had since belonged to Captain Suckling, which caused Nelson to value it as a relic. Nesbit, who was close to him at this time, placed him at the bottom of the boat, laid his hat over the shattered arm, and, after examining the wound, took some silk handkerchiefs from his own neck, which he applied as a tourniquet to the arm, and then conveyed the admiral to the *Theseus* under a tremendous fire from the enemy. One of his bargemen, named Lovel, tore his shirt into shreds, and made a sling for the broken limb. Had it not been for his son-in-law's presence of mind, Nelson must in all probability have perished. "It was the chance of war," said the admiral, afterwards writing to his wife; "and I have great reason to be thankful; and I know it will add much to your pleasure to find that Josiah, under God's providence, was principally instrumental in saving my life. I beg," he adds, "neither you nor my father will think much of this mishap; my mind has long been made up to such an event." The same night, at ten o'clock, his right arm was amputated.

In April 1798 Nelson hoisted his flag in the *Vanguard*, being ordered to rejoin Earl St. Vincent. Government being most intent on the destruction of the armament at this time preparing under Bonaparte, then a soldier of fortune at Toulon, Earl St. Vincent was directed, if he thought it necessary, to take his whole fleet into the Mediterranean; but, if he should deem a detachment sufficient, the first lord of the admiralty, in his secret instructions, observed that it was almost unnecessary for him to suggest to his lordship "the propriety of putting it under Sir Horatio Nelson." It was honourable to the commander-in-chief that he had already made this election. Nelson

sailed from Gibraltar on the 9th of May with a small squadron, to watch the motions of the enemy's armament at Toulon. Owing to a sudden storm in the gulf of Lyons on the 22nd, the Vanguard was obliged to refit; but the delay occasioned by this accident enabled Nelson to secure his junction with the reinforcement, which Earl St. Vincent had sent him, under Commodore Trowbridge, an associate worthy of himself. Trowbridge brought with him no instructions for Nelson, who was thus left to pursue his own suggestions. Missing the enemy at Goza, after hearing that they had surprised Malta, he pursued them to Egypt; but he could learn no tidings of them during his voyage, and had the dissatisfaction to find that they were not at Alexandria. He next shaped his course for the coast of Caramania, steering along the southern side of Candia, and carrying a press of sail both night and day with a contrary wind; for, said he, "it would have been my delight to have tried Bonaparte on a wind." Baffled in his aim, nevertheless, he returned to Syracuse, where, notwithstanding the Neapolitan ministry had resolved to give his squadron no assistance, being determined to do nothing that might possibly endanger their peace with the French, he yet obtained every thing he needed by means of Lady Hamilton's influence with the court of Naples. "The British fleet under my command," declared Nelson, in the memorandum which he wrote when in sight of the combined fleets, on the morning of October the 21st, 1805, "could never have returned the second time to Egypt had not Lady Hamilton's influence with the queen of Naples caused letters to be wrote to the governor of Syracuse, that he was to encourage the fleet's being supplied with every thing, should they put into any port in Sicily. We put into Syracuse, and received every supply; went to Egypt, and destroyed the French fleet. Could I have rewarded these services," adds Nelson, "I would not now call upon my country."

Renewing his pursuit, he made for the Morea; and here, on the 28th of July, he learned that the French had been seen about a month before, steering to the south-east from Candia. Nelson was always of opinion that they were originally destined for Egypt; "but," said he to the first lord of the admiralty, "be they bound to the Antipodes, your lordship may rely that I will not lose a moment in bringing them to action." Evident as were his abilities, however, when it was known he had returned after an unsuccessful pursuit, some said that he deserved impeachment; and even Earl St. Vincent had his portion of censure for having detached so young an officer upon such an important service. Standing once again for the coast of Egypt with every sail set, on the 1st of August the British fleet came in sight of Alexandria. At four o'clock in the afternoon Captain Hood, in the Zealous, made signal for the French fleet. Nelson, who for several preceding days had hardly taken either rest or food, now ordered his dinner to be served while the preparations were making for battle; and when his officers rose from table and were going to their respective stations, he said, "Before this time tomorrow I shall have gained a peerage, or Westminster Abbey!"

During the whole pursuit, says Mr. Southey, it had been Nelson's practice, whenever circumstances would permit, to have his captains on board the Vanguard, and explain to them his own ideas of the different and best modes of attack, and such plans as

he proposed to execute on falling in with the enemy, whatever their situation might be. There is no possible position, it is said, which he did not take into calculation. His officers were thus fully acquainted with his principles of tactics; and such was his confidence in their abilities, that the only thing determined upon, in case they should find the French at anchor, was for the ships to form as most convenient for their mutual support, and to anchor by the stern. "First gain the victory," he said, "and then make the best use of it you can." The moment he perceived the position of the French, that intuitive genius with which Nelson was endowed displayed itself; and it instantly struck him, that where there was room for an enemy's ship to swing, there was room for one of ours to anchor. The plan which he intended to pursue, therefore, was to keep entirely on the outer side of the French line, and station his ships, as far as he was able, one on the outer bow, and another on the outer quarter, of each of the enemy's. This plan of doubling on the enemy's ships was projected by Lord Hood, when he designed to attack the French fleet at their anchorage in Gourjean Road. Lord Hood found it impossible to make the attempt; but the thought was not lost upon Nelson, who acknowledged himself, on this occasion, indebted for it to his old and excellent commander. Captain Berry, when he comprehended the scope of the design, exclaimed with transport, "If we succeed, what will the world say!"—"There is no *if* in the case," replied the admiral; "that we shall succeed is certain; who will live to tell the story is a different question."

As the squadron advanced they were assailed by a shower of shot and shells from the batteries on the island, and the enemy opened a steady fire from the starboard side of their whole line, within half gunshot distance, full into the bows of our van ships. It was received in silence; the men on board every ship were employed aloft in furling sails, and below in tending the braces, and making ready for anchoring:—a miserable sight for the French; who, with all their skill, and all their courage, and all their advantages of numbers and situation, were upon that element on which, when the hour of trial came, a Frenchman had no hope. Admiral Brueys was a brave and able man; yet the indelible character of his country broke out in one of his letters, wherein he delivered it as his private opinion that the English had missed him, because, not being superior in force, they did not think it prudent to try their strength with him. The moment was now come in which he was to be undeceived.

A French brig was instructed to decoy the English, by manœuvring so as to tempt them toward a shoal lying off the island of Bekier; but Nelson either knew the danger, or suspected some deceit, and the lure was unsuccessful. Captain Foley led the way in the Goliath, out-sailing the Zealous, which for some minutes disputed this post of honour with him. He had long conceived that if the enemy were moored in line of battle in with the land, the best plan of attack would be to lead between them and the shore, because the French guns on that side were not likely to be manned, nor even ready for action. Intending, therefore, to fix himself on the inner bow of the Guerrier, he kept as near the edge of the bank as the depth of water would admit; but his anchor hung, and, having opened his fire, he drifted to the

second ship, the *Conquérant*, before it was clear; then anchored by the stern, inside of her, and in ten minutes shot away her mast. Hood, in the *Zealous*, perceiving this, took the station which the *Goliath* intended to have occupied, and totally disabled the *Guerrier* in twelve minutes. The third ship which doubled the enemy's van was the *Orion*, Sir J. Saumarez; she passed to windward of the *Zealous*, and opened her larboard guns as long as they bore on the *Guerrier*; then passing inside the *Goliath*, sunk a frigate which annoyed her, hauled round toward the French line, and anchoring inside, between the fifth and sixth ships from the *Guerrier*, took her station on the larboard bow of the *Franklin*, and the quarter of the *Peuple Souverain*, receiving and returning the fire of both. The sun was now nearly down. The *Audacious*, Captain Gould, pouring a heavy fire into the *Guerrier* and the *Conquérant*, fixed herself on the larboard bow of the latter; and when that ship struck, passed on to the *Peuple Souverain*. The *Theseus*, Captain Miller, followed, brought down the *Guerrier*'s remaining main and mizen masts, then anchored inside of the *Spartiate*, the third in the French line.

While these advanced ships doubled the French line, the *Vanguard* was the first that anchored on the outer side of the enemy, within half pistol-shot of their third ship, the *Spartiate*. Nelson had six colours flying in different parts of his rigging lest they should be shot away;—that they should be struck, no British admiral considers as a possibility. He veered half a cable, and instantly opened a tremendous fire; under cover of which the other four ships of his division, the *Minotaur*, *Bellerophon*, *Defence*, and *Majestic*, sailed on ahead of the admiral. In a few minutes every man stationed at the first six guns in the fore part of the *Vanguard*'s deck was killed or wounded; these guns were three times cleared. Captain Louis, in the *Minotaur*, anchored just ahead, and took off the fire of the *Auquilon*, the fourth in the enemy's line. The *Bellerophon*, Captain Darby, passed ahead, and dropped her stern anchor on the starboard bow of the *Orient*, seventh in the line, Brueys' own ship, of 120 guns, whose difference of force was in proportion of more than seven to three, and whose weight of ball from the lower deck alone exceeded that from the whole broadside of the *Bellerophon*. Captain Peyton, in the *Defence*, took his station ahead of the *Minotaur*, and engaged the *Franklin*, the sixth in the line, by which judicious movement the British line remained unbroken. The *Majestic*, Captain Westcott, got entangled with the main rigging of one of the French ships astern of the *Orient*, and suffered dreadfully from that three-decker's fire; but she swung clear, and closely engaged the *Heureux*, the ninth ship on the starboard bow, receiving also the fire of the *Tonnant*, which was the eighth in the line. The other four ships of the British squadron, having been detached previous to the discovery of the French, were at a considerable distance when the action began. It commenced about half after six; and closed about seven at night, when there was no other light than that from the fire of the contending fleets.

Trowbridge, in the *Culloden*, then foremost of the remaining ships, was two leagues astern. He came on sounding as the others had done; as he advanced the increasing darkness increased the difficulty of the navigation; and suddenly, after having found eleven fathoms water, before the lead could be hove again

he was fast aground; nor could all his exertions, joined to those of the *Leander* and the *Mutine* brig, which came to his assistance, get him off in time to bear a part in the action. His ship, however, served as a beacon to the *Alexander* and *Swiftsure*, which would else, from the course which they were holding, have gone considerably farther on the reef, and must inevitably have been lost. These ships entered the bay and took their stations in the darkness in a manner still spoken of with admiration by all who remember it. Captain Hallowell, in the *Swiftsure*, as he was bearing down, fell in with what seemed to be a strange sail. Nelson had directed his ships to hoist four lights horizontally at the mizen peak as soon as it became dark; and this vessel had no such distinction. Hallowell, however, with great judgment, ordered his men not to fire: if she was an enemy, he said, she was in too disabled a state to escape; but from her sails being loose, and the way in which her head was, it was probable she might be an English ship. It was the *Bellerophon* overpowered by the huge *Orient*: her lights had gone overboard, nearly two hundred of her crew were killed or wounded, all her masts and cables had been shot away, and she was drifting out of the line towards the lee side of the bay. Her station at this important time was occupied by the *Swiftsure*, which opened a steady fire on the quarter of the *Franklin* and the bows of the French admiral. At the same instant Captain Ball, with the *Alexander*, passed under his stern and anchored withinside on his larboard quarter, raking him and keeping up a severe fire of musquetry upon his decks. The last ship which arrived to complete the destruction of the enemy was the *Leander*. Captain Thompson, finding that nothing could be done that night to get off the *Culloden*, advanced with the intention of anchoring athwart-hawse of the *Orient*. The *Franklin* was so near her ahead, that there was not room for him to pass clear of the two; he therefore took his station athwart-hawse of the latter, in such a position as to rake both.

The first two ships of the French line had been dismasted within a quarter of an hour after the commencement of the action; and the others had in that time suffered so severely, that victory was already certain. The third, fourth, and fifth, were taken possession of at half-past eight. Meantime Nelson received a severe wound on the head from a piece of langridge shot. Captain Berry caught him in his arms as he was falling. The great effusion of blood occasioned an apprehension that the wound was mortal: Nelson himself thought so. A large flap of the skin of the forehead, cut from the bone, had fallen over one eye, and the other being blind, he was in total darkness. When he was carried down, the surgeon,—in the midst of a scene scarcely to be conceived by those who have never seen a cockpit in time of action, and the heroism which is displayed amid its horrors,—with a natural and pardonable eagerness, quitted the poor fellow then under his hands, that he might instantly attend the admiral. "No!" said Nelson, "I will take my turn with my brave fellows." Nor would he suffer his own wound to be examined till every man who had been previously wounded was properly attended to. Fully believing that the wound was mortal, and that he was about to die, as he had ever desired, in battle and in victory, he called the chaplain and desired him to deliver what

he supposed to be his dying remembrance to Lady Nelson. He then sent for Captain Louis on board from the *Minotaur*, that he might thank him personally for the great assistance which he had rendered to the vanguard; and, ever mindful of those who deserved to be his friends, appointed Captain Hardy from the brig to the command of his own ship, Captain Berry having to go home with the news of the victory. When the surgeon came in due time to examine his wound (for it was in vain to entreat him to let it be examined sooner), the most anxious silence prevailed; and the joy of the wounded men and of the whole crew, when they heard that the hurt was merely superficial, gave Nelson deeper pleasure than the unexpected assurance that his life was in no danger. The surgeon requested, and, as far as he could, ordered him to remain quiet; but Nelson could not rest. He called for his secretary, Mr. Campbell, to write the despatches. Campbell had himself been wounded, and was so affected at the blind and suffering state of the admiral that he was unable to write. The chaplain was then sent for; but before he came, Nelson, with his characteristic eagerness, took the pen and contrived to trace a few words, marking his devout sense of the success which had already been obtained. He was now left alone, when suddenly a cry was heard on the deck that the *Orient* was on fire. In the confusion he found his way up, unassisted and unnoticed, and, to the astonishment of every one, appeared on the quarter-deck, where he immediately gave orders that the boats should be sent to the relief of the enemy.

It was soon after nine that the fire on board the *Orient* broke out. Brueys was dead; he had received three wounds, yet he would not leave his post: a fourth cut him almost in two. He desired not to be carried below, but to be left to die upon deck. The flames soon mastered his ship. Her sides had just been painted, and the oil-jars and paint-bucket were lying on the poop. By the prodigious light of this conflagration, the situation of the two fleets could now be perceived, the colours of both being clearly distinguishable. About ten o'clock the ship blew up, with a shock which was felt to the very bottom of every vessel. Many of her officers and men jumped overboard, some clinging to the spars and pieces of wreck with which the sea was strewn, others swimming to escape from the destruction which they momentarily dreaded. Some were picked up by our boats, and some, even in the heat and fury of the action, were dragged into the lower ports of the nearest British ships by the British sailors. The greater part of her crew, however, stood the danger till the last, and continued to fire from the lower deck. This tremendous explosion was followed by a silence not less awful: the firing immediately ceased on both sides; and the first sound which broke the silence was the dash of her shattered masts and yards falling into the water from the vast height to which they had been exploded.

About seventy of the *Orient's* crew were saved by the English boats. Among the many hundreds who perished were the commodore *Casa-Bianca*, and his son, a brave boy only ten years old. They were seen floating on a shattered mast when the ship blew up. She had money on board (the plunder of Malta) to the amount of 600,000*l.* sterling. The masses of burning wreck which were scattered by the explosion excited for some moments apprehensions in the Eng-

lish which they had never felt from any other danger. Two large pieces fell into the main and fore-tops of the *Swiftsure* without injuring any person. A port fire also fell into the main-royal of the *Alexander*: the fire which it occasioned was speedily extinguished. Captain Ball had provided, as far as human foresight could provide, against any such danger. All the shrouds and sails of his ship, not absolutely necessary for its immediate management, were thoroughly wetted, and so rolled up that they were as hard and as little inflammable as so many solid cylinders.

The firing recommenced with the ships to leeward of the centre, and continued till about three. At daybreak the *Guillaume Tell* and the *Généreux*, the rear ships of the enemy, were the only French ships of the line which had their colours flying; they cut their cables in the forenoon, not having been engaged, and stood out to sea, and two frigates with them. The *Zealous* pursued, but as there was no other ship in a condition to support Captain Hood, he was recalled. It was generally believed by the officers, that if Nelson had not been wounded, not one of these ships could have escaped; the four certainly could not if the *Culloden* had got into action, and if the frigates belonging to the squadron had been present, not one of the enemy's fleet would have left Aboukir Bay. These four vessels, however, were all that escaped, and the victory was the most complete and glorious in the annals of naval history. "Victory," said Nelson, "is not a name strong enough for such a scene;" he called it a conquest. Of thirteen sail of the line, nine were taken and two burnt; of the four frigates, one was sunk; another, the *Artemise*, was burnt in a villanous manner by her captain, M. Estandlet, who, having fired a broadside at the *Theseus*, struck his colours, then set fire to the ship, and escaped with most of his crew to shore. The British loss, in killed and wounded, amounted to 895. Westcott was the only captain who fell: 3105 of the French, including the wounded, were sent on shore by cartel, and 5225 perished.

As soon as the conquest was completed, Nelson sent orders through the fleet to return thanksgiving in every ship for the victory with which Almighty God had blessed his majesty's arms. The French at Rosetta, who beheld the engagement, were at a loss to understand the stillness of the fleet during the performance of this solemn duty; but it seemed to affect many of the prisoners, officers as well as men; and, graceless and godless as the officers were, some of them remarked that it was no wonder such order was preserved in the British navy, when the minds of our men could be impressed with such sentiments after so great a victory, and at a moment of such confusion. The French at Rosetta, seeing their four ships sail out of the bay unmolested, endeavoured to persuade themselves that they were in possession of the place of battle. But it was in vain thus to attempt, against their secret and certain conviction, to deceive themselves; and even if they could have succeeded in this, the bonfires which the Arabs kindled along the whole coast and over the country, for the three following nights, would soon have undeceived them. Thousands of Arabs and Egyptians lined the shore and covered the house-tops during the action, rejoicing in the destruction which had overtaken their invaders. Long after the battle, innumerable bodies

were seen floating about the bay in spite of all the exertions which were made to sink them, as well from fear of pestilence as from the loathing and horror which the sight occasioned. Great numbers were cast up upon the Isle of Bekier (Nelson's Island as it has since been called) and our sailors raised mounds of sand over them. Even after an interval of nearly three years Dr. Clarke saw them, and assisted in interring heaps of human bodies, which, having been thrown up by the sea where there were no jackals to devour them, presented a sight loathsome to humanity. The shore for an extent of four leagues was covered with wreck, and the Arabs found employment for many days in burning on the beach the fragments which were cast up for the sake of the iron.

Gratulations, honours, and rewards, were now accumulated on Admiral Nelson in rapid succession by his own country and by foreign potentates. Besides presents from the grand seignior, the czar Paul, and his Sicilian majesty, he was created a peer by his own sovereign, being made Baron Nelson of the Nile and of Burnham Thorpe, with an augmentation to his arms, and a pension of 2000*l.* for his own life and the lives of his two immediate successors. Amidst these accessions to his fame, marked by due attention to his fortune, one of his captains, Benjamin Hallowell, of the *Swiftsure*, having picked up the mainmast of *L'Orient*, had directed his carpenter to make a coffin out of its planks, which he took the liberty of presenting to the admiral; that, as Captain Hallowell said, he might, when he had finished his course of glory in this world, be buried in one of his trophies. Nelson, knowing the intention of the giver, highly appreciated this present; and indeed, had it placed upright in his cabin, that, in viewing it he might always be induced to consider his latter end; nor was it to any thing short of the affectionate importunities of an old and faithful servant, who incessantly entreated him, that he conceded the request of its being removed.

Admiral Nelson, having rapidly refitted his ships, and being at length strengthened by the junction of some frigates, the want of which he described as having been "written in his heart," again stood out to sea; and on September 22, 1798, arrived at Naples, according to his instructions, where the whole kingdom seemed impatient to welcome him as their deliverer. The king himself went some leagues to sea in his barge to meet him. The victory of the Nile, "electrifying Europe from one end to the other," had emboldened the court of Naples to declare openly against France; and he whom "England loved, France feared, and Italy, and Egypt, and Turkey, celebrated," was here received with the highest honours.

Misconduct on the part of the court, and cowardice on the part of the troops, leading, at length, to the triumph of the French faction, and the Neapolitan capital becoming seriously endangered, Lord Nelson, being attached from principle to the royal family, took them, together with Sir W. and Lady Hamilton, on board his ship, and carried them safe to Palermo. After the enemy had gained possession of Naples, and erected one of their republics on the ruins of its monarchy, the latent sparks of royalty began to revive, and measures were taken for effecting a counter-revolution, in all of which his lordship concurred warmly and with vigour. Politics are too often in the extremes. On the 24th of June, 1799, Lord Nelson

arrived in the Bay of Naples, when the republicans had just concluded an armistice with the Neapolitan commander, Cardinal Ruffo, which was guaranteed by the Russian and Turkish commanders, and by Commodore Foote. Induced by the prosperous turn of his affairs to disavow the authority of the cardinal to treat with his rebellious subjects, his Sicilian majesty rejected the truce, although solemnly negotiated; and in spite of its terms, an abominable execution of a number of Neapolitan republicans, whose safety had been conditioned for, took place under the immediate cognizance of the British admiral. "These lamentable facts," observes a contemporary writer, "are certain and undeniable. They cannot be defended; they cannot be excused; they cannot, by any sophistry, be palliated."

Early in August Lord Nelson brought the Sicilian sovereign safe to his court; and, on the 13th the monarch presented him with a sword most magnificently enriched with diamonds, and conferred upon him the title of duke of Brontè, to which he annexed an estate of 3000*l.* per annum. The sword thus transferred to Lord Nelson was supposed to be worth about 80,000*l.* on account of the diamonds with which it was enriched: but its intrinsic value to such a man was rather derived from the circumstances connected with it. Charles III., on his departure for Spain, presented the sword to the king of Naples, observing, as he gave it,—“With this sword I conquered the kingdom which I now resign to you: it ought in future to be possessed by the first defender of the same; or by him who may restore it to you, should it ever be forfeited.”

Lord Keith having been appointed to the command of the Mediterranean fleet, Nelson accordingly prepared to return; and, accompanied by Sir William and Lady Hamilton, he proceeded to Trieste, and travelled through Germany, where he was received with distinguished honours. Embarking at Cuxhaven, he landed at Yarmouth, November the 6th, 1800, after an absence from his native country of three years. Naples had proved fatal, however, in more respects than one, to that unblemished reputation which had hitherto constituted his glory. It was at Naples that Lord Nelson had surrendered himself up to the fascinating influence of Lady Hamilton; and it was now, during an interval of repose, that he formally separated from his wife.

In 1801 Lord Nelson, having been raised to the rank of vice-admiral of the blue, received orders to embark again; and soon after hoisted his flag on board the *San Josef*, 112 guns, his own prize at the action off Cape St. Vincent. Nelson was soon engaged. Russia having renewed the scheme of a northern confederacy, avowedly to limit the power of England, a formidable fleet was fitted out for the north seas, under Sir Hyde Parker, in which Nelson consented to go as second in command. Copenhagen was its destination. Here the enemy, however, were well prepared for defence: upwards of 200 pieces of cannon were mounted upon the crown batteries at the entrance of the harbour; and a line of twenty-five two-deckers, frigates, and floating batteries, was moored across its mouth. The action was fought on the 2nd of April, and was entrusted to Admiral Nelson, who had with him twelve ships of the line, with all the frigates and small craft, the remainder of the fleet being left with the commander-in-chief, about four miles off. Nelson did not scruple to own that

this was the most terrible of all the engagements he had seen: it began at ten in the morning, and even at one o'clock victory was still undecided. Presently a shot through the main-mast knocked a few splinters about the admiral. "It is warm work," said he, "but, mark you, I would not be elsewhere for thousands." Sir Hyde Parker made signal for the action to cease. "Doctor," observed Nelson to the surgeon, "you know what's shown on board the commander-in-chief, No. 39?" The surgeon said he did, and asked what it meant. "Why," rejoined Nelson, "to leave off action: no, damn me if I do! You know, Foley," said he, speaking to the captain of the *St. George*, of ninety-eight guns, to which he had shifted his flag on the sailing of the expedition, and in which he had led the way through the Sound, "I have only one eye, and have a right to be blind sometimes. Damn the signal! hoist mine for closer battle; that is the way I answer such signals. Nail mine to the mast!" The squadron of frigates hauled off; but at the very moment that the *Amazon* showed her stern to the enemy, Riou, her captain, was killed, obeying the superior in command with reluctance, and exclaiming, "What will Nelson think of us!" Though great part of the Danish line had ceased to fire, and many of them had struck, about two o'clock, it was found impracticable to effect possession of the vanquished ships, owing to the fire being kept up from the shore: while the crown batteries were still untouched, together with the ships at the entrance of the arsenal, and Nelson's own fleet was in a perilous state. Equal to the occasion, however, his lordship, at this most critical moment displaying a fortitude almost without a parallel, actually opened a negotiation with the crown prince; and, himself landing, arranged the preliminaries of a treaty which happily put an end to the dispute. It was for this eminent service that government felt it expedient to raise him to the rank of viscount.

Returning from this important achievement, his lordship landed once more at Yarmouth, where his first care, after he reached the shore, was to visit the hospitals containing those who had been wounded in the attack. He inquired, with the attention of a parent and a friend, into the state of their health, their necessities and situations; and in all cases where either his advice, interference, or assistance, became necessary, it was kindly and promptly extended. He had been received with all the consideration that it was possible for the inhabitants of the town to pay him; and on leaving it the volunteer cavalry insisted upon escorting him as far as Lowestoffe.

Lord Nelson was shortly after sent on an enterprise that appears to have been determined upon without sufficient information, and which, therefore, did not accomplish what the public had been induced to expect. Government deeming it requisite to quiet the apprehensions of the people with respect to the invasion so long menaced by the French, resolved to frustrate the enemy's preparations by vigorously attacking their vessels off Boulogne. This was executed on the 16th of August, 1801, under his lordship's orders, but it proved unsuccessful. He however received the thanks of the first lord of the admiralty in very expressive terms.

Repose ensued, but not peace; and on the termination of the short-lived treaty of Amiens, Lord Nelson, fitted for action much rather than quiet, accepted the command of the Mediterranean fleet,

and sailed for Gibraltar in the *Victory*. Disdaining a close blockade, the Toulon fleet escaped him, when he had watched them for two years, then formed a junction with the Spaniards, and sailed for the West Indies. He immediately followed them. Although they had eighteen sail of the line and six frigates, with 12,000 troops on board, Nelson did not hesitate to pursue them with ten ships and three frigates. "There is just a Frenchman a-piece," said he to his captains, "leaving the Spaniards to me: when I haul my colours down I expect you will do the same, but not till then." The terror of Nelson's name, however, made numbers fly before him. Having thus chased them across the Atlantic, and pursued them back to Europe, he delivered over his squadron to Admiral Cornwallis, lest they should make for Brest to liberate their fleet, and place him between two fires; and then returned to England. Nelson had scarcely been a month at Merton, his country seat, where he had proposed to enjoy the society of his friends, when, early one morning, Captain Blackwood, bearing despatches, called upon him as he was proceeding to the Admiralty. "I am sure," exclaimed Nelson, as Blackwood entered, "You bring me news of the Spanish fleets! I think I shall have to beat them yet." They had in reality joined the fleet at Ferrol, and then got safe to Cadiz. "Depend upon it, Blackwood," resumed the admiral, "I shall yet give M. Villeneuve a drubbing." Notwithstanding that he affected to be fully at ease, after Captain Blackwood's departure, and expressed his satisfaction at living in the society of his most beloved friends, he was evidently much agitated; and, shortly after, was observed to pace his favourite garden-walk, denominated by himself his quarter-deck, with more than an ordinary degree of restlessness. Lady Hamilton, who immediately discovered the cause of his emotion, was the first to rouse him from the reverie into which Blackwood's intelligence had plunged him, by questioning the sincerity of the manner in which he had professed his being quite happy and at ease, telling him at the same time that she knew he looked upon the combined fleet as his own property, and that he would be the most miserable man living if any other commander than himself did the business. He was rallied at once; calling her "good Emma" and "dear Emma," and telling her that "if there were more Emmas there would be more Nelsons." He now lost no time in offering his services, which were as readily accepted by the first lord of the admiralty, Lord Barham, who even handed him a list of the navy, bidding him choose his own captains. "Choose yourself, my lord," replied Nelson, "for you cannot choose wrong." He reached Portsmouth after an absence of only twenty-five days; he was hailed with joy wherever he went; numbers followed him to the shore; and many, when they saw him embark, knelt down to offer up prayers for his success and implore blessings on his existence. Impatient of delay, he worked down the channel, the wind blowing strongly against him, and after a rough passage arrived off Cadiz on his birth-day, September 29th, 1805, the same day on which Admiral Villeneuve had received orders to put to sea the first opportunity. Lord Nelson did not remain directly off Cadiz with his fleet, or even within sight of the port, his object being in the first instance to induce the enemy to come out. He had already arranged the plan according to which he determined to fight.

He had perceived the inconvenience of too many signals, and was resolved never to distract the attention of the fleet by a number of them. On the 4th of October, therefore, his lordship convened the admirals and captains of his fleet in the cabin of the *Victory*, where he explained to them his plan of attack, which every one readily comprehended, and which, though simple, proved irresistible.

Villeneuve, in the mean time, was not only kept ignorant of the amount of the English force, which at best mustered inferior to his own, but an American had declared to him, without intentional deceit, that Nelson could not possibly be with the fleet as he had seen him in London on the eve of his own departure. Cheered by this assurance, and relying on their own superiority, the combined fleets ventured to sea on the 19th, and on the 21st Lord Nelson intercepted them off Cape Trafalgar, about sixty miles east of Cadiz. When his lordship was satisfied that he had placed the enemy in the predicament in which they could not avoid an action, "Now," said he, "they cannot escape us; I think we may make sure of twenty of them: I shall, probably, lose a leg, but that will be purchasing a victory cheaply." This was not said with levity, but professionally; for Nelson always contemplated the result of an engagement with religious awe, and was at this time more than usually disposed to seriousness. Nelson, it is evident, felt properly affected in the contemplation of the approaching fight, since on the morning of the 21st, preparatory to his contest for glory and his country, he wrote a prayer in his journal; and he afterwards most solemnly bequeathed Lady Hamilton, and his natural daughter, whom he directed in future to adopt his name, to the beneficence of his country.

The prayer to which we allude is so characteristic of this extraordinary man that it deserves to be placed on record, especially as it was his last. "May the great God, whom I worship, grant to my country, and for the benefit of Europe, a great and glorious victory; and may no misconduct in any one tarnish it; and may humanity, after victory, be the predominant feature in the British fleet. For myself individually, I commit my life to HIM who made me; and may His blessing light upon my endeavours for serving my country faithfully. To Him I resign myself, and the just cause which is entrusted to me to defend. Amen—Amen—Amen."

We omitted to state that Nelson was discovered praying over his child, as she lay asleep at Merton, the evening before the day on which he quitted it for ever. "These," says Nelson, when referring to some public provision for Lady Hamilton and his child, "are the only favours I ask of my king and country at this moment, when I am going to fight their battle." He had nothing else to request, knowing that ample justice would be done by the nation to his family. Contrary to the wishes of those around him, on the morning of the 21st, he appeared in the coat which he uniformly wore when in action, bearing the insignia of all his orders, and which he regarded with a species of veneration. No entreaties

could now dissuade him from wearing it. "In honour I gained them," replied Nelson, speaking of those insignia, "and in honour I will die with them." "The last order he gave, previously to engaging, was—England expects every man to do his duty." "Now," said Nelson, "I can do no more: we must trust to the great Disposer of all events, and the justice of our cause! I thank God for this opportunity of doing my duty." It had been represented to him so strongly by two of his tried friends, captains Blackwood and Hardy, how advantageous it would be to the general service for him to keep out of action as long as possible, that he consented that the *Temeraire*, then abreast of the *Victory*, should be ordered to pass ahead, as likewise the *Leviathan*; but neither of them could so act, if the admiral continued to carry all his sail. Nelson, however, far from shortening his sail, seemed, even in this matter, bent to baffle the advice to which he had appeared to assent. He hoisted several flags, as he was wont to do, that some might remain: while the enemy, on the other hand, displayed no colours till late in the action, when they were obliged to show them in order to strike.

Nelson had pitched upon the *Santissima Trinidad* for the trial of his own strength, considering this ship as his "old acquaintance," having acquired his highest honour in grappling with her off Cape St. Vincent. She carried 136 guns, and had four decks. When he once got along-side his formidable antagonist, Lord Nelson ordered the *Victory* to be lashed to her, and the commander of *Trinidad* directed his men to co-operate in the same work. During four hours the conflict was most dreadful. Thus the *Victory* ran on board the *Redoubtable*, which, pouring her broad-sides into the English flag-ship, instantly let down her lower-deck ports lest she should be boarded through them. It was then that Captain Harvey, in the *Temeraire*, fell on board the *Redoubtable* on the other side, while another ship, in like way, was on board the *Temeraire*; so that these four ships, in the heat of battle, presented as compact a tier as if they had been moored together, their heads laying the same way. The lieutenants of the *Victory* depressed their guns, and fired a diminished charge, being apprehensive of their shot passing through and injuring the *Temeraire*; and as there was some danger that the enemy's ship might take fire from the guns of the lower deck, whose muzzles touched her side when they were out, the firemen of each gun stood ready with a bucket of water, which, as soon as the gun was discharged, he, unmoved by the conflict, dashed at the hole made in her sides by the shot. Twice had Admiral Nelson, actuated by feelings of humanity, given orders to cease firing upon the *Redoubtable*, supposing she had struck because her great guns were silent and she had no flag; yet it was from the mizen-mast of this ship that he at last received his death! Captain Hardy, perceiving frequent showers of musket-balls fired on the *Victory's* quarter-deck, still requested Lord Nelson to divest his dress of the insignia which so palpably exposed him to the sharp-shooters that were stationed in the main-round top of the enemy's ships. His lordship said that he would when he had time, but he paid no further attention to the caution.

Dangers rapidly increased. Almost in a minute afterwards his lordship's secretary, Mr. Scott, who stood near to him, was killed. Lord Nelson noticed

the act of throwing his secretary overboard, exclaiming, himself, at the moment, "Poor fellow!" He was now pacing the quarter-deck, about three yards from the stern, and in the act of turning, with his face to the foe, when another shot, within a few minutes, undoubtedly fired from the mizen-top of the *Redoubtable*, struck the epaulet on his left shoulder, and he instantly fell. Two sailors who were near him raised him in their arms, and carried him to the cock-pit, while the battle was in full rage. As the sailors were raising him up, Captain Hardy, who had just perceived that his lordship was fallen, took his hand, saying, "I hope, my lord, you are not badly wounded?" "Yes," said Lord Nelson, "my back is broke. Hardy, they have caught me at last." While they were conveying him down, however, he did not lose his extraordinary presence of mind; for, observing that the tiller ropes which had been shot away were not replaced, he directed that fresh ones should be forthwith rove; and, to prevent the dejection which the sight of him might occasion to his crew, he took out his handkerchief, and covered his face and the insignia of his rank. He was immediately laid upon a bed. Upon seeing him brought down, Mr. Bourke ran directly to him: "I fear," observed Mr. Bourke, "your lordship is wounded." "Mortally, mortally," replied his lordship. "I hope not, my dear lord; let Mr. Beatty examine your wounds." "It is of no use," exclaimed the suffering admiral, "he had better attend to others." Mr. Beatty approached to examine his wound. His lordship was raised up, and Beatty, whose attention was anxiously fixed upon the eyes of his patient, as the most certain indication of the nature of a wound, after a few moments glanced his eye on Bourke, expressive of what he thought. Lord Nelson, turning to Bourke, said, "Tell Hardy to come to me." When Bourke returned into the cockpit with Captain Hardy, his lordship requested the latter to come near him. "Kiss me, Hardy," said the dying hero. He kissed Nelson's cheek. "I hope your lordship," added Hardy, "will still live to enjoy your triumph." "Never, Hardy; I am dying; I am a dead man all over; Beatty will tell you so. Bring the fleet to an anchor; you have all done your duty; God bless you." He survived about an hour from the time of receiving his wound, and was perfectly sensible till within five minutes of his death. During this his last hour, though his sufferings were acute, he displayed all his characteristic coolness and reflection, and employed the time in dictating orders relative to the battle, in receiving reports respecting it, as well as inquiring into the condition of the enemy and what ships had struck. Being told that fourteen or fifteen had certainly surrendered, "That's well," said Nelson, "but I bargained for twenty." After a short pause, he cried out, "Anchor, Hardy, anchor." Captain Hardy observed, that he supposed Admiral Collingwood would now take upon himself the command. "Not while I live," answered Nelson, "no, do you anchor, Hardy." The last ship that struck before Nelson expired was the *Santissima Trinidad*, at which he expressed the most lively joy. He now felt that his last moment rapidly approached. Calling once more for Hardy, and his captain hastening near him, he said, and in a low tone, "Don't throw me overboard." He then desired he might be buried at Burnham Thorpe, unless it should please his sovereign to direct otherwise. "Kiss me, Hardy," he

again said. "Now," resumed Nelson, "I am satisfied; I have done my duty. Thank God, I have done my duty." These were the last words of Nelson, and in the arms of his captain he expired.

Scarcely was the tremendous contest at length terminated when the elements, as if in anger for their hero's death, appeared to display their utmost fury against his enemies, who had been the cause of it, but of whom numbers yet survived. In a letter written by the vice-admiral, afterwards Lord Collingwood, two days subsequent to the action, he expressed the strongest apprehensions that not one of the prizes of which he had taken possession, amounting to twenty in number, would be preserved as substantial and lasting trophies of the victory. His exertions, nevertheless, together with those of the brave men whom he commanded, so far from appearing to be subdued under the pressure of accumulating difficulties and dangers, seemed to acquire new vigour from disaster. They were so successful that four captures were preserved. The final event of this action was the capture of eighteen men of war, the French commander-in-chief, and two of his flag-officers, with a general.

Perhaps in no country, before, have higher public honours been paid to the memory of a national benefactor than those that were spontaneously conferred on Lord Nelson. His body was brought home for interment: it was exhibited for three days in the proudest state at Greenwich, from whence it was conveyed by water with due pomp to the Admiralty, and hence, the next day, January the 9th, 1806, it was drawn upon a funeral car to the cathedral of St. Paul's, where it was most solemnly buried. His funeral, being conducted at the public expense, was the most religiously magnificent spectacle ever witnessed in this country, seven of his sovereign's sons attending it. The monument since placed over his remains is represented in the annexed sketch.

NELSON, ROBERT, an English gentleman, who devoted his private fortune to acts of benevolence.

He was the son of a London merchant, and received his education at Trinity college, Cambridge. On leaving that foundation he travelled for some years on the continent, but returned to his native country some years previous to his death, which took place on the 16th of January, 1715. Few theological writers have been so popular as Mr. Nelson. Several of his works have passed through a number of editions, and the whole breathe an air of earnest piety and devotion.

NENNIUS, an ancient British historian, who was abbot of Bangor, and is generally said to have flourished about the year 620, and to have taken refuge at Chester at the time of the massacre of the monks of that monastery. Bishop Nicholson, however, contends that from his own book it is evident that he did not exist before the ninth century. He composed several works, of which catalogues are given by Bale and Pits; but the only one remaining is his "*Historia Britonum*, or *Eulogium Britanniae*."

NESBIT, ALEXANDER, a Scottish antiquary, who was born in 1672, and educated for the bar by his father, who ranked high among the lawyers of the period. He however devoted but little of his time to the study of his profession as he was almost entirely employed in antiquarian pursuits. The fruits of his labours were, "*An Essay on the Use of Armouries*;" a valuable treatise "*On Heraldry*," and "*An Heraldical Essay on Additions of Figures of Cadency*." Mr. Nesbit died in 1725.

NESTOR, a Russian historian, born about 1056. He was a monk in the Petscherian or cavern monastery in Kiev, and died after 1116. Besides biographies of abbots and other members of his monastery, the fragments of which were collected by another hand, he wrote a chronicle in his vernacular tongue, which is an important contribution to the history of the north, having evidently imitated and profited by the Byzantine historians with regard to the most ancient history. The other sources from which he obtained information are unknown. He wrote much as a contemporary, or from the traditions of an old monk of the monastery. This work is modelled according to the spirit of his age. Pious reflections and scriptural language are frequently interwoven with the narration, and the persons are usually introduced speaking. But the original text of his chronicle is lost, and by the interpolations of those who have continued the history to the year 1203, it is altered to an incredible degree, so that no correct decision can be passed upon his historical merits before strict enquiries have been made to determine how much of the historical information now extant is derived from the ancient Nestor. It has never yet been determined with certainty to what year his researches extended. Schlozer has rendered great service to this father of Russian history, by the publication of his unfortunately not completed work, Nestor's "*Russian Annals*" (from 862 to 1110), compared with the original Slavonic text, and with the errors and interpolations expurgated as far as possible, explained and translated; besides which may be mentioned, as an abridgment and improvement, Müller's "*Ancient Russian History*, from Nestor, with reference to Schlozer's *Russian Annals*," which are here corrected, completed, and enlarged.

NESTOR, was the most distinguished of the Grecian heroes at Troy for wisdom, the consequence of his great age (hence the phrase a Nestor); he was also

particularly celebrated for his mild and persuasive eloquence. These are the qualities Homer has attributed to him in the *Iliad*. Nestor was the son of Neleus and Chloris. He was educated at Gerania, and succeeded his father as prince of Pylos. In his youth and manhood he distinguished himself by many bold exploits, but also early acquired the reputation of a prudent counsellor and persuasive orator. He signalized himself among the Lapithæ, whom he assisted in their war with the Centaurs. After Lynceus and Idas, the sons of Aphareus, were killed by the Dioscuri, he also became king of Messenia. Notwithstanding he had lived through two generations when the expedition of Troy was undertaken, he nevertheless took part in it, and conducted the forces under his command in twenty, or, according to some accounts, in ninety vessels, to Troy. Whether we reckon a generation at a hundred years as the ancients did, or at thirty years as is usual with us, in either case Nestor was too old to take a personal share in the combats before Troy. The part which is attributed to him in the *Iliad* is that of an experienced counsellor. He endeavoured to produce a reconciliation between Agamemnon and Achilles, and encouraged, advised, instructed, and blamed the Grecian heroes. Without his interference the siege of Troy would more than once have been abandoned. After the capture of Troy he returned to Greece. According to the *Odyssey*, Telemachus here visited him to obtain information concerning Ulysses. Homer states Eurydice, the oldest daughter of Clymene, to have been his wife; others, Anaxibia, the daughter of Cræteus. He had several sons and daughters, but they are not distinguished in history. After Nestor had outlived three generations he died quietly at Pylos, where, even to a late period, the inhabitants have pretended to distinguish his dwelling and his grave.

NESSELRODE, COUNT CHARLES ROBERT.

—This Russian nobleman for many years filled the important offices of privy counsellor and secretary of state for foreign affairs. He was born in Livonia in 1755, of an ancient family, which had held the rank of counts since 1110. He early entered the diplomatic career. Count Capo d'Istrias shared with him the direction of foreign affairs in the cabinet of St. Petersburg until 1821, when the revolution of the Greeks and the policy of Russia towards the Turks caused Capo d'Istrias to leave the ministry; after which time Count Nesselrode stood alone at the head of foreign affairs. He concluded on the 9th of March, 1813, a treaty with Prussia, at Breslau, and on the 15th of the following June, a treaty of subsidy with England, at Reichenbach; he then concluded, at Teplitz, the treaty between Russia and Austria. In 1814 he followed the emperor to France, and signed the quadruple alliance at Chaumont. In the night of the 30th of March, 1814, he and Count Orloff, on the part of Russia, Count Paar on the part of Austria, and Marshal Marmont on the part of France, signed the convention by which Paris was to be surrendered. All the notes issued at that time by the allies, as well as the peace of Paris, are also signed by Count Nesselrode. At the congress of Vienna he was one of the most active members. It was he who delivered the celebrated Russian note of December 1814 to Austria, Prussia, and Great Britain, which pronounced the new division of Poland and the cession of the chief part of Saxony to Prussia. He signed, in March 1815, the outlawry

of Napoleon and the renewed treaty of Chaumont. After that period Count Nesselrode was one of the most active diplomatists of the holy alliance, and followed the emperor Alexander to Aix-la-Chapelle in 1818, to Tropau in 1820, Laybach in 1821, and Verona in 1822. His services were rewarded by many Russian and foreign orders, and very considerable grants of land from his sovereign.

**NETSCHER, GASPAR**, a clever German painter, who was born at Heidelberg in 1639. His father, John Netscher, a sculptor, died when his son was quite young. He soon showed his talent for painting, and at a later period intended to go to Italy to perfect himself, but he married in Bourdeaux, and returned to Holland. He settled at the Hague; and the necessity of supporting a numerous family obliged him to devote himself to portrait painting and small works, though his death of Cleopatra proves that he had talent and inclination to distinguish himself in the higher branches of the art, and to elevate himself above his school. Even in that point which forms the characteristic excellence of the Dutch school—a faithful imitation of nature, and particularly of the materials of dress—he excelled the Dutch painters. The white satin and velvet in the drapery of his paintings, and the wool of his carpets, are true almost to deception. His touch is easy and delicate. His smaller cabinet pictures are most highly valued on account of their finish. In these he represents groups of a few gracefully-drawn figures: he is particularly fond of portraying among them one female figure in white satin. In his historical paintings he generally selected his subjects from Roman history. He died at the Hague in 1684, and left two sons, Constantine and Theodore, who were also meritorious painters, but much inferior to their father.

**NETTELBECK, JOACHIM CHRISTIAN**, a man who deserves to be mentioned for his patriotism, his diversified life and perseverance, exhibiting an instance of great firmness and honesty, though there is nothing brilliant in his career. He was born in Colberg, in Pomerania, had been a sea captain, and was one of the persons, though he was then seventy years old, to whom Colberg was greatly indebted for the honour of being the only Prussian fortress not taken by the French in 1807, in spite of a severe siege. Nettelbeck died in 1824. In his old age he wrote his own life, which appeared in Leipsic in three volumes. It is a work of much interest, and we should like to see a good translation of it, as a relief among the many high-flown fictions of the day.

**NEVE, TIMOTHY**, a clergyman of the established church, who was born in Shropshire in 1694, and educated at St. John's college, Cambridge. He was the author of "An Essay on Printing," and died in 1757.

**NEVILE, ALEXANDER**, an English poet, who was the son of a gentleman of independent fortune. He was born in the county of Kent in 1544, and educated at Cambridge, after which he was appointed secretary to the archbishops Parker and Grindal. He published the "Cambridge Verses on the Death of Sir Philip Sidney," paraphrased the *Cædipus* of Seneca, and wrote a narrative in Latin of Ketts' Rebellion. He died in 1615.

**NEWCOMEN, MATTHEW**, a non-conformist divine, who received his education at St. John's college, Cambridge, where he took his degree of M. A.

This gentleman was distinguished for his talents as a preacher, and also for having been one of the authors of the celebrated "Smectymnuus." He passed the latter part of his life in Holland, where he died in 1666.

**NEWCOMEN, JOHN**.—This talented individual was distinguished by his valuable improvements in the construction of the steam-engine. He was in his youth apprenticed to a locksmith; but notwithstanding his humble occupation, he engaged in various scientific researches, and carried on a correspondence with Dr. Hooke, to whom he communicated his improvements and inventions. His attention had been drawn to the subject of the steam-engine by the observations of the marquis of Worcester, the French philosopher Papin, and by Captain Savary's proposal to employ the power of steam in draining the mines of Cornwall. Mr. Newcomen conceived the idea of producing a vacuum below the piston of a steam-engine after it had been raised by the expansive force of the elastic vapour, which he effected by the injection of cold water to condense the vapour. Having completed his improvement, he in conjunction with Captain Savary, Switzer, and Cawley, took out a patent, by which they realized a very handsome fortune; but it is to James Watt, of Glasgow, that the world is indebted for the final improvement of that stupendous prime mover.

**NEWDIGATE, SIR ROGER**.—This patron of learning was born in 1719, and received his education at Oxford. On the death of his father he came into the possession of a handsome fortune, which he devoted to the improvement of literature. He was for many years the representative of the university of Oxford in parliament. His only work is "A Treatise on the Harmony of the Four Gospels." He died in 1780.

**NEWTON, SIR ISAAC**.—This learned mathematician and natural philosopher was the descendant of an ancient family in Lincolnshire, and was born in

December 1642, at the family-seat called Woolsthorpe, in that county. This house, which was made memorable by being the birth-place of so great a man, has been preserved with great care. Dr. Stukeley, who

visited it in Sir Isaac Newton's time, gives the following description of it in his letter to Dr. Mead, written in 1727:—" 'Tis built of stone, as is the way of the country hereabouts, and a reasonable good one. They led me up stairs and showed me Sir Isaac's study, where I suppose he studied when in the country in his younger days, or perhaps when he visited his mother from the university. I observed the shelves were of his own making, being pieces of deal boxes which probably he sent his books and clothes down in on those occasions. There were some years ago two or three hundred books in it of his father-in-law, Mr. Smith, which Sir Isaac gave to Dr. Newton of our town. When the house was repaired in 1798, a tablet of white marble was put up by Mr. Turner in the room where Sir Isaac was born, with the following inscription:—' Sir Isaac Newton, son of John Newton, Lord of the Manor of Woolsthorpe, was born in this room on the 25th of December, 1642.'

"Nature and Nature's laws lay hid in night,  
God said 'Let Newton be,' and all was Light."

The following lines have been written upon the house:—

"Here Newton dawn'd, here lovely wisdom woke,  
And to a wondering world divinely spoke.  
If Tully glowed, Phœdrus's steps he trode,  
Or fancy formed Philosophy a God;  
If sages still for Homer's birth contend  
The sons of Science at this dome must bend,  
All hail the shrine! All hail the natal day!  
Cam boasts his noon,—This Cot his morning ray."

A view of the manor-house of Woolsthorpe is given in the accompanying sketch.

It stands in a romantic valley about a mile from the North Road, and is about five miles from Grantham. At the school in that town he received his education. On his first entrance in the school he was not distinguished for talent, but by great study and application. During the hours of play, when the other boys were occupied with their amusements, his mind was engrossed with mechanical contrivances, either in imitation of something he had seen or in execution of some original conception of his own. For this purpose he provided himself with little saws, hatchets, hammers, and all sorts of tools, which he acquired the art of using with singular dexterity. The principal pieces of mechanism which he thus constructed, were a windmill, a water-clock, and a carriage put in motion by the person who sat in it. When a windmill was erecting near Grantham, on the road to Gunnerby, Isaac frequently attended the operations of the workmen, and acquired such a thorough knowledge of the machinery that he completed a

working model of it, which excited universal admiration. This model was frequently placed on the top of the house in which he lodged at Grantham, and was put in motion by the action of the wind upon its sails. Not content with this exact imitation of the original machine, he conceived the idea of driving it by animal power, and for that purpose he enclosed in it a mouse which he called the miller, and which, by acting upon a sort of tread-wheel, gave motion to the machine. According to some accounts, the mouse was made to advance by pulling a string attached to its tail, while others allege, that the power of the little agent was called forth by its unavailing attempts to reach a portion of corn placed above the wheel.

His water-clock was formed out of a box which he had solicited from Mrs. Clark's brother. It was about four feet high, and of a proportional breadth, somewhat like a common house-clock. The index of the dial-plate was turned by a piece of wood, which either fell or rose by the action of dropping water. As it stood in his own bedroom he supplied it every morning with the requisite quantity of water, and it was used as a clock by Mr. Clark's family, and remained in the house long after its inventor had quitted Grantham. His mechanical carriage was a vehicle with four wheels, which was put in motion with a handle worked by the person who sat in it, but, like Merlin's chair, it seems to have been used only on the smooth surface of a floor, and not fitted to overcome the inequalities of a road. Although Newton was at this time "a sober, silent, thinking lad," who scarcely ever joined in the ordinary games of his school-fellows, yet he took great pleasure in providing them with amusements of a scientific character. He introduced into the school the flying of paper kites; and he is said to have been at great pains in determining their best forms and proportions, and in ascertaining the position and number of the points by which the string should be attached. He made also paper lanterns, by the light of which he went to school in the winter mornings, and he frequently attached these lanterns to the tails of his kites in a dark night, so as to inspire the country people with the belief that they were comets.

In 1656 his mother, who had married, and again been left a widow, removed him from school, with a view to obtaining his assistance in the management of her small property. His aversion to what is commonly called business, however, and his devotion to abstract study, gained so obviously upon him, that his mother was at last induced to give a reluctant consent to his entering at Cambridge. It was on the 5th of June, 1660, in the eighteenth year of his age, that Newton was admitted into Trinity college, where he immediately devoted his attention to the science of mathematics, and he soon displayed his peculiar genius by his original discoveries.

In 1665 the students of the university of Cambridge were suddenly dispersed by the breaking out of a pestilential disorder in the place. Newton retired for safety to his paternal estate; and though he lost for a time the advantages of public libraries and literary conversation, he rendered the years of his retreat a memorable era in his own existence and in the history of science by one of his great discoveries, that of the theory of gravitation, or the tendency of bodies towards the centre of our globe. His mind was never idle; experiments, conclusions, and reflections, occupied it continually. He saw an

apple fall from a tree, and immediately began to consider the general laws which must regulate all falling bodies. At that time a degree had never been actually measured upon the surface of the earth; his first attempts to account for the wonders of the whole solar system by the principle of gravitation alone, were, therefore, imperfect, from the want of sufficient data; but resuming the subject afterwards, he found that the same cause which made an apple fall to the ground retained the moon and planets in their orbits, and regulated, with a simplicity and power truly wonderful, the motions of all the heavenly bodies. On his return to Cambridge in 1667 he was elected fellow of Trinity college, and two years afterwards he was appointed professor of mathematics in the place of his friend, Dr. Barrow, who resigned.

The first mathematical work which especially engaged the attention of Newton was Wallis's "Arithmetic of Infinites," a work well fitted for suggesting new views in geometry and calling into activity the powers of mathematical invention. Wallis had effected the quadrature of all those curves in which the value of one of the co-ordinates can be expressed in terms of the other without involving either fractional or negative exponents. Beyond this point neither his researches nor those of any other geometer had yet reached, and from this point the discoveries of Newton began. The Savilian professor had himself been extremely desirous to advance into the new region, where, among other great objects, the quadrature of the circle must necessarily be contained; and he made a very noble effort to pass the barrier by which the undiscovered country appeared to be defended. He saw plainly, that if the equations of the curves which he had squared were ranged in a regular series, from the simpler to the more complex, their areas would constitute another corresponding series, the terms of which were all known. He further remarked, that in the first of these series, the equation to the circle itself might be introduced, and would occupy the middle place between the first and second terms of the series, or between an equation to a straight line and an equation to the common parabola. He concluded therefore, that if, in the second series, he could interpolate a term in the middle, between its first and second term, this term must necessarily be no other than the area of the circle. But when he proceeded to pursue this very refined and philosophical idea, he was not so fortunate; and his attempt toward the requisite interpolation, though it did not entirely fail, and made known a curious property of the area of the circle, did not lead to an indefinite quadrature of that curve. Newton was much more judicious and successful in his attempt. Proceeding on the same general principle with Wallis, as he himself tells us, the simple view which he took of the areas already computed, and of the terms of which each consisted, enabled him to discover the law which was common to them all, and under which the expression for the area of the circle, as well as of innumerable other curves, must needs be comprehended. In the case of the circle, as in all those where a fractional exponent appeared, the area was exhibited in the form of an infinite series.

The problem of the quadrature of the circle, and of so many other curves, being thus resolved, Newton immediately remarked, that the law of these series

was, with a small alteration, the law for the series of terms which expresses the root of any binominal quantity whatsoever. Thus he was put into possession of another valuable discovery, the binominal theorem, and at the same time perceived that this last was in reality, in the order of things, placed before the other and afforded a much easier access to such quadratures than the method of interpolation, which, though the first road, appeared now neither to be the easiest nor the most direct.

It is but rarely that we can lay hold with certainty of the thread by which genius has been guided in its first discoveries. Here, however, we are proceeding on the authority of the author himself; for in a letter to Oldenburg, secretary of the royal society of London, he has entered into considerable detail on this subject, adding, (so ready are the steps of invention to be forgotten) that the facts would have entirely escaped his memory, if he had not been reminded of them by some notes which he had made at the time, and which he had accidentally fallen on. The whole of the letter just referred to is one of the most valuable documents to be found in the history of invention.

In all this, however, nothing occurs from which it can be inferred that the method of fluxions had yet occurred to the inventor. He has assured us himself, however, that the great principle of the new geometry was known to him, and applied to investigation as early as 1665 or 1666. Independently of that authority we also know, on the testimony of Barrow, that soon after the period just mentioned there was put into his hands, by Newton, a manuscript treatise, the same which was afterwards published under the title of "*Analysis per Æquationes Numero Terminorum Infinitas*," in which, though the instrument of investigation is nothing else than infinite series, the principle of fluxions, if not fully explained, is at least distinctly pointed out. Barrow strongly exhorted his young friend to publish this treasure to the world; but the modesty of the author, of which the excess, if not culpable, was certainly in the present instance very unfortunate, prevented his compliance. All this was previous to the year 1669; the treatise itself was not published till 1711, more than forty years after it was written.

For a long time, therefore, the discoveries of Newton were only known to his friends; and the first work in which he communicated any thing to the world on the subject of fluxions was in the first edition of the "*Principia*," in 1687, in the second Lemma of the second book, to which, in the disputes that have since arisen about the invention of the new analysis, reference has been so often made. The principle of the fluxionary calculus was there pointed out, but nothing appeared that indicated the peculiar algorithm, or the new notation, which is so essential to that calculus. About this Newton had yet given no information, and it was only from the second volume of Wallis's works, in 1693, that it became known to the world. It was no less than ten years after this, in 1704, that Newton himself first published a work on the new calculus, his "*Quadrature of Curves*," more than twenty-eight years after it was written.

Newton was in his temper, as in his mind, quiet and unpretending; he seems, however, to have possessed a large fund of affection, which was of an enduring nature, although we can scarcely trace its

effects upon the onward tenour of one in whom intellect so preponderated.

In the house where he lodged there were some female inmates, in whose company he appears to have taken much pleasure. One of these, a Miss Storey, sister to Dr. Storey, a physician at Buckminster, near Colsterworth, was two or three years younger than Newton; and to great personal attractions she seems to have added more than the usual allotment of female talent. The feelings of regard which Newton entertained for this young lady gradually rose to a higher passion; but the smallness of her portion and the inadequacy of his own fortune, appear to have prevented the consummation of their happiness. Newton's esteem for her continued unabated during his life. He regularly visited her when he went to Lincolnshire, and never failed to relieve her from little pecuniary difficulties which seem to have beset her family.

After Sir Isaac Newton took up his residence in London he lived in a very handsome style, and kept his carriage, with an establishment of three male and three female servants. In his own house he was hospitable and kind, and on proper occasions he gave splendid entertainments, though without ostentation or vanity. His own diet was frugal, and his dress was always simple; but on one occasion, when he opposed the honourable Mr. Annesley as a candidate for the university, he is said to have put on a suit of laced clothes. His generosity and charity had no bounds, and he used to remark, that they who gave away nothing till they died never gave at all. Though his wealth had become considerable by a prudent economy, yet he had always a contempt for money, and he spent a considerable part of his income in relieving the poor, in assisting his relations, and in encouraging ingenuity and learning. With all this plainness of character, we find in him a strong tendency to that mysticism which, more or less, is an inmate in every human bosom, but in him was so powerful that nothing but the transcendent strength of his reasoning faculties could have kept it within due bounds. We learn that his attention was first turned to the study of mathematics by a desire to enquire into the truth of judicial astrology. We are inclined to trace partly to this the bias of his nature, the delight which he took in investigating and attempting to reduce to a system the mystery of prophecy. The following letter, dated four years subsequent to the publication of his "*Principia*," shows how much his mind was occupied with this subject, while towering in the pride of its strength:—

"Cambridge, Feb. 7, 1690-1.

"Sir,—I am sorry your journey proved to so little purpose, though it delivered you from the trouble of the company the day after. You have obliged me by mentioning me to my friends at London, and I must thank both you and my Lady Masham for your civilities at Oates, and for not thinking that I made a long stay there. I hope we shall meet again in due time, and then I should be glad to have your judgment upon some of my mystical fancies. The Son of Man, Dan. vii., I take to be the same with the Word of God upon the White Horse in Heaven, Apoc. xii., for both are to rule the nations with a rod of iron; but whence are you certain that the Ancient of Days is Christ? Does Christ any where sit upon the throne? If Sir Francis Masham be at Oates, pre-

sent, I pray, my service to him, with his lady, Mrs. Cudworth, and Mrs. Masham. Dr. Covel is not in Cambridge. I am your affectionate and humble servant,

"IS. NEWTON."

The "historical account of two notable corruptions of the Scripture," although originally compiled about the same time with his "*Observations on the Prophecies of Holy Writ*," seems to have been retouched at a later period. It brings the author again into his own field of scrutiny and comparison, and astonishes us with his acquirements in a walk foreign to his own pursuits. Nearly the same remark applies to his "*Chronology*," in which he has effected every thing that was compatible with the then confused condition of archæological knowledge and research.

When Newton was chosen a fellow of the royal society, he communicated to that learned body a description of a new arrangement for reflecting telescopes, which rendered them more convenient by diminishing their length without weakening their magnifying powers, and soon after the first part of his labours on the analysis of light. When the first feelings of surprise and admiration excited by this noble work had subsided, the society appointed three members to study it fully and report upon it. Hooke, a man of extensive acquirements and an original turn of thought, but of excessive desire of renown, being one of the members, undertook to draw up the report. Instead of discussing the new facts as presented by the experiments of Newton, he examined them merely in relation to an hypothesis of his own—that light is simply the effect of vibrations excited and propagated in an elastic medium—and concluded by allowing whatever appeared reconcilable with his own hypothesis, and by advising Newton not to seek any other explanation of the facts. Newton in reply, after exposing some errors of Hooke, adduces new experiments confirming his former results, and refutes the objections to the production of whiteness by the mixture of all the rays. To several other attacks, particularly one by Huygens, which appeared in the "*Philosophical Transactions*," and which were conducted on similar principles, he was obliged to reply. In vain did he declare that he neither advanced nor admitted any hypothesis whatever, and that his sole object was to establish and connect facts by means of the laws of nature. This severe and abstract method of reasoning was little understood, and it is hardly conceivable into what minuteness of detail he was obliged to enter. So much was he disgusted with these difficulties, that he gave up his intention of printing his lectures on optics with his treatise on series. Before quitting the lists, however, he addressed another paper to the royal society, completing the account of his results and of his views on the nature of light. This treatise, united with his first paper on the analysis of light, afterwards served as the base of the great work "*Treatise on Optics*," in which, however, the experimental investigation of the phenomena is more extensive and more strictly separated from all hypothesis. The new experiments with which it was enriched relate principally to the colours observed in thick plates of all bodies when they are presented in a proper manner to the incident ray. Newton reduced them to the same laws as those of the phenomena in thin plates; and then, considering these laws as established facts, equally certain with the particular experiments from

which they are deduced, yet far more universal, he unites them all in one general property of light, each peculiarity of which is characterized with such exactness as to make the general property a pure expression for all the observed laws. The essence of this property is, that each particle of light from the instant when it quits the radiating body whence it emanates, is subject periodically, and at equidistant intervals, to a continual alternation of dispositions to be reflected from or transmitted through the surfaces of the diaphanous bodies which it meets with; so that, for instance, if such a surface presents itself to the luminous particle during one of the alternations, when the tendency to reflection which Newton called the "fit of easy reflection" is in force, this tendency makes it yield more easily to the reflecting power of the surface; while, on the other hand, it yields with more difficulty when it is in the contrary phase, which he termed the "fit of easy transmission."

In another paper read before the royal society, after excusing himself for proposing a conjecture as to the nature of light, and declaring that it had no connexion with the facts which he had discovered, he goes on to give one which he should be inclined to consider most probable if he were obliged to adopt any. He then admits the existence of an imperceptible fluid (which he calls æther), extending every where in space, and penetrating all bodies with different degrees of density. This fluid he considers as highly elastic, and consequently pressing against itself and the material parts of other bodies with an energy proportional to its actual density. If this æther be disturbed or agitated in any one point, by any cause which produces a vibratory motion, this motion must transmit itself by undulations through all the rest of the medium; and if these undulations encounter in their passage the material particles forming the substance of any body, they will agitate them with considerable force. Now light, he admits, consists of a peculiar substance different from the æther, but composed of heterogeneous particles, which, darting in all directions from luminous bodies with great velocity, agitate the æther in their passage and excite undulations. He does not attempt to determine the essence of these particles.

From this time till 1679 Newton communicated nothing to the royal society, and in this interval appears to have been occupied with astronomical observations. In that year he had occasion to write to Hooke about a system of physical astronomy, on which the royal society had asked his opinion. In his letter he proposed, as a matter deserving attention, to verify the motion of the earth by direct experiment, viz. by letting bodies fall from a considerable height, and observing if they follow exactly a vertical direction; for if the earth turns, since the rotary velocity at the point of departure must be greater than at the foot of the vertical line, they will be found to deviate from this line towards the east instead of following it exactly, as they would do if the earth did not move. Hooke replied that wherever the direction of gravity is oblique to the axis of the earth, bodies in falling change parallels and approach the equator. This led Newton to consider whether the elliptical motion of the planets could result from a force varying inversely as the square of the distance, and if so under what circumstances such a result would ensue. In proposing his experiment to the society, he had consi-

dered the motion of the heavy body as determined by a force of constant intensity, and had concluded the trajectory to be a spiral, doubtless because he imagined the body to fall in a resisting medium such as the air. Hooke replied that it should not be a spiral, but that in a vacuum it would be an eccentric ellipse, which in a resisting medium would change into an eccentric ovoidal curve; and he represented the eccentric ellipse as the consequence of a force inversely proportional to the squares of the distances from the earth's centre.

Newton, having examined this result by mathematical calculations, found that an attractive force, emanating from a centre, and acting inversely as the squares of the distances, would produce motions exactly resembling the planetary motions, both in regard to the form of the orbit and the velocity of the body at each point. This was the secret of the system of the world; but it still remained to account for the discordance of the moon's motion, which had before embarrassed Newton. But in 1682, having learned the results of the new measurement of a degree by Picard, he resumed his former calculations from these data. Finding, as he advanced, the manifest tendency of these numbers to produce the long-desired results, he became so much agitated as to be unable to go on with his calculation, and requested one of his friends to finish it. Two years were spent in penetrating the consequences of this discovery, and preparing his immortal work, "*Philosophiæ Naturalis Principia Mathematica*," during which time he lived only to calculate. He would sometimes rise, and suddenly arrested by some new conception, would sit on his bedside for hours together, and would forget his meals, unless reminded of the necessity of taking nourishment. It was not till 1686 that he finally concluded to present his work to the society, at the expense of which it was printed in 1687. Not more than two or three of his contemporaries were capable of understanding it, and more than fifty years elapsed before the great physical truths which it contained were thoroughly understood by the generality of scientific men.

In 1687 Newton was one of the delegates sent by the university of Cambridge, to maintain its rights before the high commission court, when they were attacked by James II., and in 1688 was elected by the university to the convention-parliament, but never distinguished himself in that body. He had always taken great interest in chemistry, and occupied himself occasionally with experiments in that science. He had constructed a small laboratory for prosecuting his investigations, and seems, after the publication of the "*Principia*," to have devoted almost his whole time to them. One morning he had accidentally shut up his little pet dog Diamond in his room, and on returning found that the animal, by upsetting a candle on his desk, had destroyed the labours of several years. On perceiving his loss, he only exclaimed, "Oh, Diamond! Diamond! you little know the mischief you have done." But the grief caused by this circumstance injured his health, and M. Biot endeavours to show, for some time impaired his understanding. This fact of a derangement of his intellect, according to Biot, explains why Newton, though only forty-five years old when the "*Principia*" was published, never after gave to the world a new work in any branch of science, and merely published some which had been previously composed.

Dr. Brewster, however, refutes this notion. In 1696 he was appointed warden of the mint, a general recoinage having then been undertaken. In this office he rendered essential service, and in 1699 was made master of the mint. In 1701 he was again returned to parliament by his university, in 1703 he was chosen president of the royal society, and in 1705 was knighted by Queen Anne. In 1704 he gave to the world his "Optics" (in English, translated into Latin by Dr. S. Clarke), which contains all his researches on light. The princess of Wales (daughter-in-law of George I.), a woman of a cultivated mind, had received Newton with great kindness, and was fond of conversing with him. Newton having one day explained to her a system of chronology which he had composed for his amusement, she requested a copy for her own use. A copy was also given to abbé Conti, who immediately published it without Newton's knowledge; and it therefore became necessary to prepare a more correct edition, which appeared in 1728, under the title of "Chronology of Ancient Kingdoms amended." During the latter part of his life, the reading of religious works, with the conversation of his friends, formed almost

ton's health was good until his eightieth year, when he suffered from a calculous disorder, which occasioned his death, March 20th, 1726. His corpse lay in state in Jerusalem Chamber, Westminster, and on the 28th was interred in Westminster Abbey. The monument which was afterwards erected to his memory is subjoined.

NEWTON, JOHN, an English clergyman, who was born in 1725, and intended for the naval profession; but, owing to his religious feelings having been awakened by the scenes that he witnessed on board a ship in which he was placed, he abandoned the sea service entirely. In 1764 he entered holy orders, and obtained the rectory of St. Mary, Woolnoth; previous to which, however, he was for some years curate of Olney in Buckinghamshire. While there he formed an acquaintance with Cowper; in conjunction with whom he published a volume of hymns. He was also the author of "A Review of Ecclesiastical History," and several other works. His death took place in 1797.

NEWTON, RICHARD, a learned English divine who was born in 1676 in Buckinghamshire. He received the rudiments of his education at Westminster school, and completed his studies at Christ Church college, Oxford. He subsequently obtained the canonry of Christ Church; and it was Dr. Newton who erected Hart Hall into a college. He wrote several valuable works, amongst which we may mention his treatise "On University Education." His death took place in 1753.

NEWTON, THOMAS, an English theological writer, who was born at Lichfield in 1703, and educated at Trinity college, Cambridge, where he obtained a fellowship. In 1744 he obtained the rectory of St. Mary-le-Bow, London, and in 1745 took the degree of D. D. He published an edition of the "Paradise Lost" of Milton, with notes and a memoir of the author, in 1749; and he afterwards edited, in a similar manner, the "Paradise Regained." But his literary reputation depends chiefly on his "Dissertations on the Prophecies," several times reprinted. In 1761 Dr. Newton was made bishop of Bristol, and afterwards obtained the deanery of St. Paul's, which he held till his death. His works were published with an autobiographical memoir.

NEY, MICHEL, MARSHAL.—This brave but unfortunate French officer was born in 1769 at Sarre Louis, in the department of the Moselle. He was of humble origin, and being destitute of family connexions, he yielded to his favourite passion, which was a desire to distinguish himself as a soldier. He accordingly entered the army as a simple hussar, passed rapidly through all the intermediate steps, and in 1792 he became an adjutant, a lieutenant in 1793, and in 1794 a captain. It was after these promotions that he was first noticed by General Klebar, who attached him to his staff, and obtained for him the rank of *chef d'escadron*. Ney was next entrusted with the command of a corps of partisans, a body capable of great exploits, but little esteemed, however, by the army, as they do not receive any regular pay and consequently live chiefly on plunder. On that occasion this young soldier of fortune distinguished himself both by the valour he displayed and the stratagems he resorted to for the purpose of traversing the enemy's lines, cutting off their supplies, and disturbing their cantonments. At the same time he employed every moment, not demanded by his

his only amusement after performing the duties of his office. He had almost ceased to think of science; and during the last ten years of his life, when consulted about any passage in his works, he would reply, "Ask Mr. De Moivre; he knows better than I do." When his friends expressed their admiration of his discoveries, he said, "To myself I seem to have been as a child playing on the sea-shore, while the immense ocean of truth lay unexplored before me." His countenance was rather calm than expressive, and his manner rather languid. Sir Isaac New-

professional avocations, in study. In 1796, while serving in the army of the Sambre and Meuse, Ney exhibited multiplied proofs both of his personal courage and good conduct. The engagements of Altenkirchen, Dierdorf, Montabaur, and Bendorf, contributed not a little to extend his reputation. It is said that on one occasion, with only 100 cavalry, he made 2,000 infantry prisoners of war, and obtained possession of Wirtzburg, with an immense quantity of ammunition and provisions. Two days after he attacked and vanquished a detachment of horse, double in number to his own; and after passing a river, the banks of which were lined with cannon, he made himself master of Forsheim, although defended by seventy pieces of artillery; on this he was nominated a general of brigade. While engaged in carrying on the war many emigrants were taken by him, but he always contrived to elude the orders for shooting them. This circumstance gave rise to an observation on the part of one of the deputies on mission, who, addressing himself to Kleber, pointedly remarked, "that his friend Ney always conducted himself like a man of honour, both during the combat and after the victory; for he knew both when and how to spill and to spare the blood of his countrymen!" So great had his reputation now become that in April 1797 he commanded the French cavalry at the battle of Neuwied, on which occasion he pierced through the Austrian lines and contributed powerfully to the success of that day. Immediately after this he forced the enemy to abandon Giessen, and pursued them as far as Steinberg; but he was at length obliged to retreat in the face of a superior force, and was taken prisoner in consequence of his horse falling under him while exposing himself like a common soldier in order to save a piece of artillery. General Hoche soon obtained Ney's liberation by exchange; and on returning to the army he was immediately raised to the rank of a general of division. Soon after this he repaired to Paris, and declared against what was then termed *Le Parti de Clichy*, which then prevailed in the council of ancients; but this is the only time that we find his name inscribed in the political annals of the revolution. Both before and after this period he strictly confined himself to his military functions. In 1799 he served in the army of the Rhine, and commanded the cavalry at the battle of Thur, which was fought on the 26th of May, 1799. On the 3rd of the following November he distinguished himself by a singular exploit, which conveys some idea of his military character. The city of Mannheim, separated from the French army by the Rhine, was at that period defended by a large garrison, and was considered as the key of Germany on that part of the frontiers. Both on this and other accounts it became highly desirable for the French to obtain possession of it, more especially as it was situated in a fertile country capable of affording subsistence for their troops, and would assist them at the same time in their incursions on the other side of the river. Finding that this object was not to be attained by ordinary means, stratagem was therefore resorted to. Accordingly the general, disguising himself in a Prussian dress, crossed the Rhine during the night, and found means to enter the town, and after examining all the posts and avenues in person, returned without discovery, being chiefly indebted for his safety to the facility with which he conversed in the German language. Perceiving that numbers would only embarrass and be-

tray him, he selected 150 soldiers, who resolved to risk their lives in such an extraordinary enterprise; and with this feeble but gallant detachment he effected a passage at eight o'clock in the evening. At eleven he had attacked and carried all the advanced works; and the governor having imprudently commanded a sally, he repulsed the enemy, entered the gate along with the fugitives in consequence of the darkness of the night, and actually obtained possession of the city before the numbers of the assailants were discovered.

In 1800 he was entrusted with the command of the left wing of the army of the Rhine; and at Worms and Frankenthal is reported to have conducted himself with equal ability and ardour. On the 5th of June he fought the battle of the Iller, on which occasion he took possession of all the enemy's artillery. Soon after this we find him in possession of Frankfort and Stuttgart; and also reaping new laurels at the battle of Zurich, in which the Austrians were once more defeated. The general after this served both under Massena in Switzerland and Moreau in Germany. In 1802 Bonaparte, then first consul, by way of testifying his esteem, and, perhaps also with a view of attaching this rising officer to his interests, presented him with a superb Egyptian sabre. At the peace of Luneville, Ney was appointed inspector-general of cavalry. Scarcely had he received orders for this purpose than Bonaparte sent him into Switzerland as minister plenipotentiary; in consequence of which the former became, first, mediator between the contending cantons, and then for a while the sole arbiter of their destinies.

On his recall, after his completing the object of his mission, the general assumed the command of the army of Compiegne. He then removed to the camp of Boulogne, where an immense body of troops was posted for the purpose of invading England. The moment that Bonaparte assumed the title of emperor, he conferred on Ney the rank and dignity of marshal of the empire. In 1804 he was also nominated a grand officer of the seventh cohort of the legion of honour. Nearly at the same time he was decorated with the ribband, and created knight of the order of Christ in Portugal. On the renewal of the war in Germany the army, lately encamped on the sea-coast, traversed France with astonishing expedition, chiefly by means of carriages prepared for the occasion, and in 1805 it once more crossed the Rhine. On his arrival in Germany, Marshal Ney fought the memorable battle which conferred on him the title of duke of Elchingen. After the capitulation of Ulm he repaired to the Tyrol with 30,000 men, by means of which he obliged the archduke John to evacuate that country. He then entered Carinthia, where he remained until the peace of Presburg. On the rupture with Prussia in 1806 we find this bold and active officer occupying a strong position between Bamberg and Amberg. At the battle of Jena, fought on the 14th of October, he commanded the sixth corps, forming the right wing of the French army under Soult, after which Magdeburg capitulated to him.

The Russian army alone now presented a front to the French. But General Beningsen was at length forced by Marshal Ney to repass the Pregel; who also proved victorious at Deppen, on which occasion the celebrated Platoff was taken prisoner. At length the battle of Friedland put an end to the campaign,

and the war was, for a while, terminated by the peace of Tilsit.

But the cessation of hostilities in the north was only a signal for the commencement of a new and far more sanguinary war in the south. Bonaparte, blinded by vanity and ambition, and instigated by a career hitherto almost uniformly victorious, in a luckless hour, determined on new conquests. Accordingly, those gallant soldiers who had survived the victories of the Pregel and the Oder were now devoted to perish on the banks of the Ebro and the Tagus. Ney, on this occasion, was not suffered to repose in France. Hastening to the scene of action, in the autumn of 1808, he rushed into a conflict entirely new to him, the dangers of which were incalculable, for the enemy always proved most formidable when unseen and unheard of. The national junto, which then exercised the government of Spain in the name of Ferdinand VII., had by this time organized a regular resistance; and the generals Castanos and Palafox occupied strong positions in the neighbourhood of Tudela, where the marshal attacked, and would have annihilated them but for the impetuosity of his colleague Lannes.

After this he received orders from Bonaparte to march against Madrid; while the latter soon after took advantage of the new war with Austria to leave a country in which he despaired to gather any laurels. Previously to this event Ney had an interview with the emperor, and frankly told him, in the presence of his own staff, "that it was not with an army, but a whole people they had now to contend; and that he augured ill of the termination of the present conflict." The other frankly confessed that the "people were fanaticised by the priests, and that Spain had become the *Vendée* of France; yet, notwithstanding this, he had subdued the one, and would soon put an end to the other." But although Ney disapproved of the war, he nevertheless did every thing in his power to bring it to a speedy conclusion. Accordingly, he made a forced march to Benevento, with the intention to cut off the retreat of the English; but the gallant General Moore had by this time reached the passes of Galicia; while Romana sheltered the wreck of his army among the mountains of Puebla de Sannabria. Massena being now invested with the command, sent the marshal to besiege Ciudad Rodrigo, who took possession of it after a gallant resistance, and granted his life to the governor, and a capitulation to the garrison, although neither had been stipulated. In the midst of these proceedings the Anglo-Portuguese army, under the command of Lord Wellington, occupied the formidable heights of Sierra de Buzaco. Massena, so celebrated for his campaigns in Italy, instead of attempting to turn their flanks, as proposed by Ney, in express opposition to the formal protests of that officer, marched against the front. Having failed, as was foreseen, in consequence of the steady bravery of the allies, the commander in chief was forced to recur to the original plan; on which, the enemy retired slowly, and in good order, to the chain of mountains called Torres Vedras, between the sea and the Tagus. Massena made many spirited but ineffectual attempts to cross this river; he then tried to draw out the English by offering them battle, but he failed in them both. Famine, in addition to disease, now produced the most frightful ravages in his army in consequence of the wise precaution adopted by the inhabitants to destroy all their provisions. At the

approach of the French the men retired into the mountains with their flocks, while the women, the children, the nuns, and the monks, fled to Lisbon. The command of the rear-guard, on which the safety of all depended, was entrusted to Ney. His conduct on this occasion attracted the attention and applause of both friends and foes; but his spirited remonstrances to Massena induced the latter to order the marshal home; and at the same time he transmitted serious charges against him to Bonaparte on the score of insubordination. The emperor, as if to obliterate the injustice, impolicy, and ill success of the Spanish war, now meditated an invasion of Russia, partly with a view of forcing that power to join the continental confederacy against England, and partly with the hope of concealing his late reverses under a blaze of glory.

Having assembled an immense army for this purpose, he commenced his march for the ancient capital of Moscow; and Ney, on this occasion, was placed along with Murat, at the head of a most formidable advanced guard. The former distinguished himself as usual at the capture of Smolensko; and the most auspicious results being now prognosticated, Bonaparte, as if misled by his destinies, continued his march at the very moment when it would have been but an act of prudence to have passed the winter in Poland. On assembling a council of war to demand the opinions of the principal officers, Ney addressed the emperor in the following words:—

"Sire!—The present war appears to me extraordinary in its nature. The Russians never fought before with such intrepidity, and you have hitherto overcome the enemy by the superiority of your manœuvres alone. But the grand army is as yet unsubdued; and we have still a hundred leagues to march before we reach Moscow. The whole country being covered with immense forests, and destitute of cities, nay, almost of villages, how shall we obtain provisions, even for 50,000 men? What is to become of our wounded? How shall we be able to keep up our communication with Wilna? It is my opinion, therefore, that the army ought to establish itself on the banks of the Dwina, and the Dnieper, while we occupied Smolensko and its vicinity with a strong advanced guard. What we found in Spain ought to teach us what a nation is capable of, when animated by fanaticism, the love of country, and an attachment to their prince! Instead of marching to Moscow, which is equally hostile to the interests of your majesty, either now or hereafter, I am of opinion that we ought to wait for the enemy here: they will assuredly come in search of us in this very spot; you will then exterminate them, as at Austerlitz; after which you will be master of the destinies of the universe." The marshal was opposed on this occasion by Caulincourt, who had been employed on a diplomatic mission to Russia. The latter proposed the liberation of the peasantry as a sure mode of success; and at the same time flattered the ruling passion of the emperor by hailing the present as the most glorious period of his life. An advanced movement, and a pitched battle, was the result; and Ney, having pierced the enemy's line, and contributed greatly to the victory, obtained the title of prince of Moskowa.

The capture of the ancient capital of Russia, the retrograde march of the French, the famine, the miseries, the disorders, the diseases, and, above all, the

disorganization that ensued, are all depicted in our life of Bonaparte. On this occasion, however, the marshal evinced his usual courage, and contributed not a little to save the remains of this once-numerous army, the escape of any part of which appeared to be miraculous. Bonaparte, on one occasion, embraced him on the field of battle, and exclaimed aloud,—“That he less lamented the loss of his troops, as the audacious and enterprising duke of Elchingen remained safe!” All Europe, astonished at this sudden change in the condition of France, prognosticated her downfall. She who had hitherto acted constantly on the offensive, was now forced to fly before three Russian armies. The Austrians began already to hesitate; Hamburgh and Berlin were once more occupied by the enemy; the king of Prussia, delivered from subjection, was at the head of a resolute body of troops; while Murat, to whom Bonaparte had originally entrusted the command of the fugitives, had been displaced, and left the prince viceroy at the head of broken squadrons and discomfited legions. The emperor, however, whose power and popularity seemed as yet unshaken, obtained new supplies of men and money; and raised the hopes, as well as gratified the vanity of the nation, by resorting, as usual, to magnificent promises. He then invested his consort, Marie Louise, with the regency; left Paris on the 15th, and opened the campaign on the 28th of April, 1813. Marshal Ney, on this occasion, repassed the Saale at the head of 40,000 men, and drove the allies back on Leipsic. After a short, but bloody contest, Bonaparte once more entered Dresden, on the 8th of May, and threw a bridge across the Elbe, in the neighbourhood of that city. The French army soon after passed the Spree, and fought the battle of Bautzen, on which occasion Ney, as usual, contributed not a little to the victory. But although the allies had retired in good order, yet the emperor of Russia now made propositions for peace; while the emperor of Austria offered his mediation; and an armistice for some time suspended all further hostilities. In consequence of this palpable mistake on the part of the French, Russia and Prussia were enabled to bring up their respective contingents; while the sovereign of Austria prepared to declare against his son-in-law. Bernadotte, too, more anxious to obtain a foreign throne than to succour his countrymen, soon arrived at Stralsand, with 30,000 Swedes. Ney, who commanded the army of Silesia, proved, as usual, fortunate; but on being recalled to Dresden, the duke of Tarentum, who succeeded him, and who did not possess the confidence of the soldiery to the same extent, was beaten by Blücher. In his new situation the marshal assisted the emperor in the defence of the capital of Saxony, and was present at the battle before Dresden, in which Moreau was killed, and the allies obliged to retreat for fear of being cut off by Vandamme. But that general, instead of being able to assist the grand army, entered the mountains of Bohemia, where he was taken prisoner, with the loss of 10,000 men, together with his baggage and artillery. Marshal Ney, having now become the most prominent character in the whole French line, was appointed to replace the duke of Reggio, who had experienced a succession of checks and disasters while opposed to the troops of Bernadotte. On his arrival at head quarters he immediately assumed an offensive attitude, and attacked the left wing of the prince of Sweden, but was finally beaten

by Bernadotte. The French, immediately after this defeat, were obliged to fall back to Leipsic, where, three days after, a battle was fought in which Ney gallantly maintained his position, although the whole Saxon army went over in a body to the enemy. The retreat that ensued was accompanied with circumstances eminently disastrous to the French; and the emperor, with great difficulty, reached the banks of the Rhine, accompanied by a miserable remnant of the grand army. Immediately after this Bonaparte repaired to his capital for the express purpose of reorganizing his troops by means of fresh levies. No sooner had a small number of these arrived at head quarters than the campaign re-commenced; but Ney, finding no more than 6000 men at Nancy, was obliged to evacuate that city, which was immediately entered by the allies. Two grand divisions of the allied army were now in full march for Paris, and Bonaparte, who had experienced great losses, was obliged to evacuate Troyes. During his retreat, however, he became enabled, in consequence of a masterly movement effected by Ney, to stop the progress of one of the columns under General Sacken, whom he obliged to withdraw in great disorder.

After the abdication of Napoleon, Ney was nominated commander-in-chief of the royal cuirassiers, dragoons, chasseurs, and light horse lancers, a knight of St. Louis, a peer of France, and governor of the sixth military division. It was the king himself who, in person and with his own hand, conferred the ribbon and star of the above order, and who received the oath of fidelity. Ney now retired to the bosom of his family as his military career appeared to be terminated. However, on the 6th of March, 1815, he was ordered to repair instantly to the sixth military division, then under his command. He accordingly left his seat in the course of the same evening; but, instead of setting out directly for Besançon, he resolved to pass through Paris, partly with the intention to provide himself with his military equipage, and partly in order to obtain some information respecting the object of his mission.

The minister at war having refused all explanation under pretext that his despatches would be found at head quarters, he repaired to the king early in the morning of the 7th, and took leave of his majesty with many expressions of loyalty and zeal. Having placed himself with all possible speed at the head of the troops, he learned that Bonaparte had entered Lyons,—that he was proceeding by easy marches towards the capital,—that the defection of the soldiery had become general,—that the cries of *Vive l'Empereur!* resounded from all parts,—that Monsieur had retired to Moulins,—and that Macdonald had been obliged to fly in order to preserve his life. On the evening of the 13th of March certain emissaries despatched by Bonaparte delivered him two letters, one written by Bertrand, and the other by the ex-emperor himself, in which the latter, after reminding him of their campaigns and exploits, gave him peremptory orders, in the same style and form as if he had been still on the throne. While thus reduced to a state of doubt and indecision, the baron Capelle, prefect of l'Ain, arrived at this critical moment with intelligence that his vanguard, posted at Bourg, had gone over to the enemy, and that the inhabitants of Chalons-sur-Saône, after having declared themselves in a state of insurrection, had seized all his park of artillery. The recital of these disasters seemed to confirm all that had

been told by the agents of Bonaparte, and he instantly exclaimed, "It is impossible for me to stop the water of the ocean with the palm of my hand!" From this moment Ney determined to declare openly in behalf of his former chief. He accordingly assembled his staff, and having commanded his troops to be drawn up in order of battle, he read to them the following proclamation, which was instantly inserted in the orders of the day:—

"Officers, sub-officers, and soldiers!

"The cause of the Bourbons is lost for ever! The sole legitimate dynasty which the French nation ever adopted is once more about to ascend the throne; it appertains alone to the emperor Napoleon, our sovereign, to reign over this charming country. It signifies not whether the Bourbon nobility choose to expatriate themselves once more, or to live among us; the sacred cause of liberty and independence will suffer but little from their unfriendly influence. They have endeavoured to undervalue our military glory, but without effect; for our labours have been too noble and too illustrious ever to be forgotten!

"Soldiers! the times have passed away when men were to be governed by extinguishing their rights. Liberty at length triumphs; and Napoleon, our august emperor, is about to render her empire permanent. May this glorious cause become the cause of all Frenchmen! and may all the brave men whom I have the honour to command be penetrated with this sentiment!

"Soldiers! I, who have so often led you to victory, am about to conduct you to join that immortal phalanx which accompanies the emperor Napoleon to Paris; and there, within the space of a few days, all our hopes and all our wishes shall be realized! *Vive l'Empereur!*

"The marshal of the empire,

"PRINCE DE LA MOSKOWA."

The troops, on hearing this address, became electrified; all the regal ornaments were instantly destroyed, while the imperial eagles were joyfully substituted in their place. On the 18th of March, finding Bonaparte at Auxerre, he immediately addressed a letter to him, in which it was stated that the conditions on which he and his officers now joined his standard were, "that he should renounce all ideas of foreign conquest, and contribute every thing in his power to effect the happiness and prosperity of France." The ex-emperor received him with open arms, and promised every thing that could be desired. Soon after this they entered Paris; but, notwithstanding the unhopd-for arrival and signal success of Bonaparte and his adherents, the inhabitants of that capital were loud in their disapprobation of the sudden change and great inconstancy exhibited by the marshal. On the 23rd of March, Ney received instructions to visit Lisle, and all the line of frontier from Condé to Landau, for the purpose of inspecting the troops and confirming their attachment. After having accomplished this mission, and delivered a report to the minister at war, he immediately repaired to his country seat at Cordeaux, leaving his family behind him at Paris. It is evident from this circumstance, which occurred at so critical a period, either that Bonaparte was displeased with the prince of Moskowa, or that the prince of Moskowa was displeased with Bonaparte. It has been asserted, indeed, that they were mutually disgusted with each other. On the re-organization of the peerage, however, the

name of Ney was inserted in the new list; but it was not until the 11th of June, when the allies had advanced into Belgium, that the marshal received orders to repair to the northern frontier.

On the 15th of the same month he was present in the French camp in front of Charleroy, in which Bonaparte had arrived on the preceding evening. Although his orders were so sudden that he was obliged first to borrow and then to buy horses, yet, in the course of that very forenoon, he placed himself at the head of a body of troops, and appears to have obtained some success. On the 16th, at break of day, he was again mounted, and busied in surveying the army, and preparing for the approaching battle.

On the morning of the 17th the English made a slight retrograde movement. Ney followed and harassed the rear-guard with his advanced corps; and, his cavalry having arrived about noon, he made several successive assaults, which were received by his opponents with their accustomed intrepidity. At five in the evening the British troops found themselves most advantageously posted in the strong position of Waterloo, with the forest of Soignies to cover it, and a number of strong and formidable batteries to support its future operations. The two armies remained in presence of each other during the night, which was spent by Bonaparte in preparing for a general action. The rain that fell in torrents seemed at first to oppose all hopes of a battle, which was about to decide the destinies of France. About twelve o'clock next day the French at length advanced in columns from the centre, and a desperate and sanguinary engagement ensued. Ney, on this occasion, fully displayed the impetuosity of his character, and seemed determined either on death or victory. Galloping about in all directions, during the hottest period of the action, he himself sometimes headed a body of cavalry; at other times he would lead on a division of infantry. Although dismounted, covered with contusions, and disfigured with blood and dirt, he still combated at the head of the regiments of guards, while the other corps were reduced by death, or the want of ammunition, to a state of inaction. At seven o'clock in the evening victory seemed to him to have declared in favour of his countrymen. Arriving on foot, with his sword waving in his hand, at the head of the second regiment of light infantry, which was reduced to a mere skeleton, he was heard to exclaim, "Comrades! the event of this day depends on you; remember that these are Englishmen who are opposed to you!" On learning that all their powder and ball had been expended, the officers of a regiment of cavalry brought them cartridges which had been provided for their own pistols; and with these they instantly charged their muskets.

At eight the French army deemed itself certain of conquest, and it was reported that the horses were yoked to many of the English guns for the purpose of withdrawing them; but in consequence of orders, either ill conveyed or ill understood, Bonaparte, who had reckoned on the support of Marshal Grouchy, did not obtain it. So thoroughly was he deceived that he mistook the troops of Bulow for those of that general; and it was not until the Prussian cannon began to fire reiterated volleys that he found his mistake. It was in vain that he attempted to rally his troops; the first line fell back on the second; the whole army was thrown into complete disorder; so that officers, soldiers, and even Napoleon himself,

were carried away by the torrent. Ney was the last general who quitted the field of battle. Overcome with fatigue, and unable to retire, a speedy death seemed destined to conclude his mortal career; and he owed his safety solely to the attentions of a corporal of the guards, who defended and supported him during his retreat, which was effected on foot. Having at length reached St. Quintin, he set out for Paris, and on the 22nd of June stated in the chamber of peers, "that the army no longer existed, and that it was absolutely necessary to make peace with the enemy!" Soon after this he exclaimed, "It is imperative on you to recall the Bourbons, and for me to retreat to America!" Meanwhile the instrument containing the second abdication of Bonaparte arrived; a provisional government was nominated; Fouché, duke of Otranto, was placed at the head of it; and Ney was called a traitor by the general voice.

Although Ney deemed himself included in the capitulation of Paris, yet he thought it prudent to leave the capital with a view of withdrawing into Switzerland, after which he intended to repair to America. To enable him to effect this, he obtained from the Prince d'Eckmühl, then secretary at war, a discharge, together with instructions for his route, by the name of Major Reiset, of the third regiment of hussars. In addition to this, the minister of police had sent him two passports, in one of which he was designated by the appellation of Michael Theodore Neubourg. On his arrival at Lyons he was visited by the commissary-general of police, who advised him to obtain passports from the agents of Austria, as all the roads on the frontiers were guarded by their orders. On this he at first wished to return to the metropolis, but at length repaired to St. Alban, where he received a letter from his lady advising him to remain in France instead of sailing for the United States. No sooner, however, did she learn that the marshal formed one of the list of nineteen individuals accused of betraying the king and overturning the government, than she sent a confidential person to her husband, who conducted him to the Chateau Bessonis, near Aurillac, which was inhabited by one of her own relations. Here he resided some time without suspicion; but his retreat was discovered by means of the rich Egyptian sabre formerly presented to him by Bonaparte, which was left on a sofa in a room open to strangers. On learning this circumstance, the *prefet de cantal* sent some agents of the police, accompanied by an escort of *gendarmes*, to arrest him. On hearing of their intentions the marshal sent for them to his chamber, and delivered himself up without discovering the least emotion. He was then conducted to Paris by two officers, one of whom, having served under him, demanded his word of honour that he would not attempt to escape; after which they were not at all uneasy about their charge. He was met by Madame Ney on the 19th of August at a few miles' distance from Paris, and she accompanied him to the prison of the abbaye, and accused herself bitterly as the cause of his detention. He was now lodged in an apartment by himself; a *gendarme* slept constantly in his chamber; he was visited by the guard every two hours, and a wicket, which was placed before the door of his prison, enabled any one to see all that was passing within, both night and day. He rose regularly about six o'clock in the morning, and being allowed to walk in the yard during two hours, all the other prisoners were obliged to retire. After smok-

ing a few cigars breakfast was served; he then read or wrote until dinner time, constantly receiving visits from his relations and advocates. Two hours more were allotted for taking the air, after which he retired early to rest, and lived with equal sobriety and regularity, as if entirely exempt from the excesses and infirmities which some deem inseparable from a life spent in camps and amidst the fatigues of war. Marshal Ney was first brought before a court-martial, which declared itself incompetent to take cognizance of his case. His trial was therefore referred to the chamber of peers, where the minister, the duke de Richelieu, was eager for his punishment. His advocate was Dupin. The twelfth article of the capitulation of Paris, signed on the 3rd of July, 1815, promising a general amnesty, was quoted in his favour; but Wellington affirmed that this was not the true construction of the article. Notwithstanding the remonstrances of Marshal Davoust, who had made the treaty, and who explained it in favour of Ney, he was sentenced to death on the 8th of December, by 169 votes against seventeen. With the calmness which had distinguished him through the whole trial he listened to the sentence; but when the person who read it came to his title he interrupted him—"What need of titles now? I am Michel Ney, and soon shall be a handful of dust." When the assistance of a priest was offered him, he replied, "I need no priest to teach me how to die; I have learned it in the school of battle." He permitted, however, the curate of St. Sulpice to accompany him to the scaffold, and compelled him to enter the carriage first, saying, "You mount before me now, sir, but I shall soonest reach a higher region." On the 7th of December, 1815, at nine o'clock, A. M., he was shot in the garden of the Luxemburg. When an attempt was made to blindfold him, he tore away the bandage, and indignantly exclaimed, "Have you forgotten that for twenty-six years I have lived among bullets?" then, turning to the soldiers, he solemnly declared that he had never been a traitor to his country, and laying his hand upon his heart, called out with a steady voice, "Aim true. France for ever! Fire!"

NICANDER, a learned Greek physician and poet at the court of Pergamus about 160 years B. C., who was born, according to some accounts, at Colophon. Two of his poems are still extant—"Theriaca," upon poisonous animals, and the remedies against their bite; and "Alexipharmaca," upon antidotes in general. Both are important in natural history.

NICCOLS, RICHARD, an English poet of the seventeenth century, who was the editor of the "Mirror for Magistrates." In 1616 he published a poem entitled "Sir Thomas Overburie's Vision with the Goats of Weston, Mrs. Turner, the late Lieutenant of the Tower, and Franklin." In addition to this he was the author of several popular poems.

NICHOLAS I., PAULOWITZ, emperor of Russia, was born on the 7th of July, 1796, and succeeded his brother Alexander I. after Cæsarowitsch Constantine, his elder brother, had renounced his claims in his favour, in December 1825. He was married, in July 1817, to Alexandra Feodorowna, formerly Charlotte, princess of Prussia. He has several children. Alexander, the eldest, and heir apparent, was born in 1818.

NICHOLAS, SAINT, a celebrated bishop of Myra, in Lycia, who was born at Patara, and raised to a bishopric by Constantine the Great. He was

remarkable for his piety and charity. He was also considered the patron of virgins and of seafaring men. The Dominicans adopted him as their tutelary saint, and the Russians hold his memory in great veneration. He died about 392. Gadshill, in the first part of "Henry IV.," uses the term, "St. Nicholas's clerks," as a cant phrase for highwaymen. Warburton remarks upon this expression, that St. Nicholas is the patron of scholars, who are thence called "St. Nicholas's clerks."

NICHOLS, RICHARD, a celebrated physician to King George the Second, who was born in 1699, and received his education at Christ Church college, Oxford. Dr. Nichols rose rapidly in his profession, and in 1743 became physician to the king, of whose death he published an account in the "Transactions of the Royal Society." His principal work was entitled "De Anima Medica." Dr. Nichols died in 1779.

NICHOLS, JOHN.—This gentleman was for many years the editor of "The Gentleman's Magazine." He was born in February 1744 at Islington, where he spent the principal part of his life. It was in 1757, before Mr. Nichols was quite thirteen years of age, that he was placed under Mr. Bowyer, who appears to have been not only the instructive master, but the kind and indulgent friend to his apprentice, and was often anxious to amuse him by encouraging a taste for poetry, of which Mr. Nichols had afforded some specimens. Of these Mr. Bowyer thought so favourably, that in 1760, when he was only in his sixteenth year, he enjoined him as an evening's task to translate a Latin poem of his own, published in 1733, and entitled "Bellus Homo et Academicus." This Mr. Nichols executed with considerable spirit and humour, and in the following year Mr. Bowyer associated him with himself in translating the Westminster verses which had been spoken on the previous coronation of George the Second. The applause bestowed on these efforts led Mr. Nichols to become a more constant votary of the Muses, and from 1761 to 1766 his productions made no inconsiderable figure in the periodical journals. In 1763 he published two poetical pamphlets, the one entitled "Islington, a Poem," and the other "The Buds of Parnassus," which was republished in 1764, with some additional poems. In 1765 he contributed several poems to a miscellaneous collection, published by Dr. Perfect of Town Malling, under the title of "The Laurel Wreath." Before Mr. Nichols's apprenticeship expired, he was sent to Cambridge to treat with that university for a lease of their exclusive privilege for printing Bibles. His endeavours, however, proved unsuccessful only because the university determined, on a due consideration of the matter, to keep the property in their own hands.

Soon after, Mr. Bowyer gave a proof of the high value he placed on Mr. Nichols's services, when the period of them expired, by returning to his father half of his apprentice-fee. In 1766 he took him into partnership, and in the following year they removed their office from White Friars to Red Lion Passage, Fleet Street, where it remained until a very few years since. This union lasted until the death of Mr. Bowyer in 1777; as Mr. Nichols continued to be not only the printer, but the intimate friend and assistant in the learned labours of some of the first scholars of the age.

The first publication, in which he was concerned

as an author, was "The Origin of Printing, in two Essays;" the first, "The Substance of Dr. Middleton's Dissertation on the Origin of Printing in England;" and the second, "Mr. Meerman's Account of the Invention of the Art at Harleim, and its Progress to Mentz, with occasional Remarks, and an Appendix."

As the works which passed through Mr. Bowyer's press engaged a more than common attention on the part of Mr. Nichols, he, very early in life, conceived a high opinion of the merits of Dean Swift; and having collected materials, he published in 1775 a supplemental volume to Dr. Hawkesworth's edition. The next publication of Mr. Nichols's was the "Original Works, in Prose and Verse, of William King, LL.D. with Historical Notes." This publication likewise exhibits an extraordinary proof of diligence.

In 1778 Mr. Nichols obtained a share in "The Gentleman's Magazine," of which he became the editor. This was an event of the greatest importance to all his subsequent pursuits. It had not been long under his care before it obtained a consequence which it had never before reached, although the preceding volumes were formed from the contributions of some of the most able scholars and antiquaries of the time.

In 1780 Mr. Nichols published a very curious "Collection of Royal and Noble Wills." In this work he acknowledges his obligations to Mr. Gough and to Dr. Ducarel, for obtaining transcripts and elucidating by notes. It was a scheme originally suggested by Dr. Ducarel, probably in consequence of the publication of the will of Henry the Seventh, by Mr. Astle, some years before. To this work, in 1794 Mr. Nichols added the will of Henry VIII., which is now seldom to be found with the preceding, itself a work of great rarity. Amidst these more serious employments Mr. Nichols diverted his leisure hours by compiling a work which seems to have been entirely of his own projection, and the consequence of early predilection. This appeared in 1780, with the title of "A Select Collection of Miscellaneous Poems, with Historical and Biographical Notes." To these were added, in 1782, four other volumes, with a general poetical index. In this curious work he not only revived many pieces of unquestionable merit, which had long been forgotten, but produced some originals from the pens of men of acknowledged genius. In so large a collection are some which might perhaps have been allowed to remain in obscurity without much injury to the public; but even in the production of these he followed the opinion of some of the best critics of the time, bishops Lowth and Percy, Dr. Warton, Mr. Kynaston, &c. The biographical notes were deemed very interesting, and were the origin of a similar improvement being made to Dodsley's "Collection of Poems," in the edition of 1782, if we mistake not, by Isaac Reed. The publication of the "Bibliotheca Topographica" took up ten years, and in some hands might have been quite sufficient to employ the whole of those years. But such was the unwearied industry of our author, that within the same period no less than eighteen publications issued from his press, of all which he was either editor or author.

In 1781 he published "Biographical Anecdotes of William Hogarth." This was republished in 1782, again in 1785, and a fourth and more complete edition in 1810. In 1822 Mr. Nichols superintended a superb edition of Hogarth's works, from the

original plates, restored by James Heath, Esq., and furnished the explanations of the subjects of the plates.

In the same year, 1781, he was the author of "Biographical Memoirs of William Ged, including a Particular Account of his Progress in the Art of Block-printing." But what in the course of years and slow gradations almost imperceptibly became the most important of all Mr. Nichols's biographical labours, was his "Anecdotes of Bowyer, and of many of his Literary Friends," 1782. Soon after he published "The History and Antiquities of Hinckley;" "The History and Antiquities of Aston Flamville and Burbach, in Leicestershire;" "Collections towards the History and Antiquities of the Town and County of Leicester;" and "The History and Antiquities of the Town and County of Leicester." Among his later publications were a second edition of Bowyer's "Greek Testament;" Bishop Atterbury's "Correspondence," illustrated, as usual, with topographical and historical notes; "A Collection of Miscellaneous Tracts by Mr. Bowyer;" "The History and Antiquities of Lambeth Parish;" "The Progresses and Royal Processions of Queen Elizabeth;" "The History and Antiquities of Canonbury, with some Account of the Parish of Islington;" "Illustration of the Manners and Expenses of Ancient Times in England."

During the same period Mr. Nichols published an edition of "The Tatler," with notes. He afterwards edited Sir Richard Steel's "Epistolary Correspondence," "The Lover and Reader," "The Town Talk," &c.; "The Theatre and Anti-Theatre," by the same author, all illustrated with notes, furnished from many forgotten records. He had for some time been a member of the Court of Assistants of the stationers' company, and in the same year attained what he called "the summit of his ambition, in being elected master of the company." On the 8th of January, 1807, by an accidental fall, Mr. Nichols had one of his thighs fractured; and on the 8th of February, 1808, experienced a greater calamity in the destruction by fire of his printing-office and warehouses, with the whole of their valuable contents. "Under these accumulated misfortunes" (we use his own words), "sufficient to have overwhelmed a much stronger mind, he was supported by the consolatory balm of friendship, and offers of unlimited pecuniary assistance;—till, cheered by unequivocal marks of public and private approbation (not to mention motives of a higher and far superior nature), he had the resolution to apply with redoubled diligence to literary and typographical labours."

Mr. Nichols soon after resumed his labours. Besides completing his "History of the County of Leicester," already mentioned, he returned to his "Life of Bowyer, of which one volume had been printed, but not published, just before his fire, under the title of "Literary Anecdotes of the Eighteenth Century, comprising Biographical Memoirs of William Bowyer, Printer, and many of his learned friends; an incidental view of the progress and advancement of literature in this kingdom during the last century; and biographical anecdotes of a considerable number of eminent writers and ingenious artists." This he lived to extend to nine large volumes octavo; to which he afterwards, finding materials increase from all quarters, added four volumes, under the title of "Illustrations of the Literary History of the Eigh-

teenth Century, consisting of authentic memoirs and original letters of eminent persons; and intended as a sequel to the literary anecdotes."

Mr. Nichols's death took place on the 26th of November, 1826. He had passed some cheerful hours with his family, and was retiring to rest about ten o'clock at night. He had reached a step or two of the lower staircase, accompanied by his eldest daughter, when he said, but with no particular alteration of voice, "Give me your hand," and instantly, but gently sunk down on his knees, and expired without a sigh or groan, or any symptom of suffering.

NICHOLS, WILLIAM, a learned English divine, who was born at Donnington in Buckinghamshire, in 1644, and received his education at Magdalen college, Oxford. Having entered holy orders, he obtained the valuable living of Selrey in Sussex, where he died in 1712. He was the author of several theological works, of which the most celebrated was his "Defence of the Church of England."

NICHOLSON, JAMES, an American naval officer, who was born in Chestertown, on the eastern shore of Maryland, in the year 1737. His ancestors were among the first and most respectable settlers of that province. Having a predilection for the life of a sailor, he and two brothers who were afterwards commanders in the American navy, were trained to the sea. This occupation he followed until the year 1763, at which time he married and settled in the city of New York, where he continued to reside until 1771. He then returned to his native province, and lived on the eastern shore of Maryland, until the period of hostilities between Great Britain and her colonies in America. At that time the English privateers captured many trading vessels on the shores of the Chesapeake. The government of Maryland therefore built and equipped a ship of war, which they named the Defence, and put under the command of Nicholson, who recaptured, in March 1776, several vessels which had been taken by a British ship called the Otter. In 1788 the command of the Trumbull, a frigate of thirty-two guns, was given to Captain Nicholson. On the 2nd of June, 1780, a severe and close engagement took place between the Trumbull and a British frigate called the Wyatt. The engagement continued for three hours, at the end of which time the damaged condition of the Trumbull's mast induced Nicholson to draw off. The Trumbull had eight men killed and twenty-one wounded, nine of whom died after the action. Her crew consisted of only 199 men at the commencement of the action. This action, next to the engagement of the Richard and Seraphis, is supposed to have been the most severe during the war. The Trumbull was afterwards taken by an English frigate and carried into New York. At the close of the revolutionary war Captain Nicholson was released from confinement, but continued to reside in New York with his family. He died in September 1806.

NICHOLSON, WILLIAM, an ingenious writer on mathematics, natural philosophy, and chemistry, who was born in London in 1758, and went to India when young in the maritime service. In 1776 he became agent on the continent for Mr. Wedgewood, and afterwards settled in the metropolis as a mathematical teacher. He took out patents for various inventions, and published "A Journal of Natural Philosophy, Chemistry, and the Arts," which was continued for several years. His works are princi-

pally compilations, but executed with judgment. Among them are, "An Introduction to Natural Philosophy," "Dictionary of Chemistry," &c. Mr. Joyce, who died in 1816, is said to have been the principal editor of the encyclopædia published under the name of Nicholson, who is understood to have had but little concern in the work except as an occasional contributor.

NICOL, JOHN, a Scottish traveller, who was born in 1755 near Edinburgh. Almost from his cradle he entertained a strong love of the sea; and, although he served his time to the business of a cooper, yet he never relinquished his plan of entering the naval service. In 1776 he entered on board a vessel at Leith, and sailed for Canada, where he remained eighteen months. With this the detail of his simple story commences, and, however unadornedly told, is extremely interesting. On leaving this country he embarked in the *Surprise* of twenty-eight guns, Captain Reeves, and in her took part in the action with the American ship *Jason*, Captain Manly, of which action he gives a very characteristic account. After returning to England he again took convoy for St. John's. In 1785 he sailed on a voyage of discovery round the world in the *King George*, Captain Portlock, in company with the *Queen Charlotte*, Captain Dixon. They staid long among the Sandwich Islands, and especially at Owhyee, being the first ships there after the murder of Captain Cook. His next remarkable trip was in the *Lady Julian*, a vessel which carried out female convicts to New South Wales. After all, poverty was the lot of this man of many strange sights, vicissitudes, and perils. In 1822 he published his "Life and Adventures." In this work he speaks with much feeling of his lonely and destitute condition. He says, "After I came home, I little thought I should ever require to apply for a pension; and, therefore, made no application until I really stood in need of it. I eke out my subsistence in the best manner I can. Coffee made from the raspings of bread (which I obtain from the bakers), twice a day, is my chief diet. A few potatoes, or any thing I can obtain with a few pence, constitute my dinner. My only luxury is tobacco, which I have used these forty-five years. To beg, I never will submit. Could I have obtained a small pension for my past services, I should then have reached my utmost earthly wish, and the approach of utter helplessness would not haunt me as it at present does in my solitary home. Should I be forced to sell it, all I would obtain could not keep me and pay for lodgings for one year; then I must go to the poor's house, which God in his mercy forbid. I can look to my death-bed with resignation, but to the poor's house I cannot look with composure. I have been a wanderer and the child of chance all my days; and now only look for the time when I shall enter my last ship, and be anchored with a green turf upon my breast; and I care not how soon the command is given." Mr. Nicol was found dead in his bed in the month of October 1825, having to all appearance died without a struggle.

NICOLSON, WILLIAM, a learned English prelate, who was born at Hemel in Cumberland, and educated at Oxford. Having entered holy orders, he rose rapidly in the church, and was in 1702 created bishop of Londonderry, and in 1727 was raised to the see of Cashel in Ireland. This, however, he never took possession as he died in less than a month after.

He was an able writer on theological, historical, and antiquarian subjects. Among his publications we may mention his "Essay on Border Laws," his "English Historical Library," and his introduction to Chamberlayne's "Polyglott of the Lord's Prayer."

NIEBUHR, BERTHOLD GEORGE.—This celebrated historian of Rome was born in Copenhagen, on the 27th of August, 1776; but before he had reached his second year, his father received an appointment in Germany, in South Ditmarsh, whither he took his son. Intercourse with several distinguished scholars, particularly J. H. Voss, the celebrated translator of Homer, early inspired him with a peculiar love for the classics. His father was intimately acquainted with the celebrated Büsch, which was the cause of Niebuhr's residence for some time in Hamburg, where he acquainted himself with commercial affairs. Here also he was in constant intercourse with Klopstock, who entertained a great friendship for him. From 1793 to 1794 he studied law in the university of Kiel, but his inclination for the classics continued. When nineteen years old, he went to the university of Edinburgh in order to study the natural sciences under the professors of that institution. He remained one year and a half in Edinburgh, and then came to England for six months, and obtained an extensive knowledge of the institutions of our country. When he returned from this country he was appointed private secretary to the Danish minister of finance, in which situation he had an opportunity to examine closely the administration of Count Bernstorff. After a certain time he was appointed a director of the bank. In 1801 he witnessed the bombardment of Copenhagen. The invasion of Germany (which he always loved as his true country) by the French affected him much, and his translation of the first Philippic of Demosthenes, dedicated to the emperor Alexander, with a remarkable call upon him, prove his sentiments. In 1806 he was taken into the Prussian service, but soon after his arrival in Berlin the battle of Jena changed the whole condition of the kingdom. In Königsberg, whither he had followed the court, he was appointed one of the counsellors who directed public affairs under Hardenberg, until the peace of Tilsit. He then took an active part in the organization of the Prussian states under the minister Stein. In 1808 he was sent to Holland on a special mission, where he remained fourteen months, during which he always contrived to save some time from his public occupations for study. On his return to Berlin he was made privy-counsellor of state, and a temporary officer in the department of finances. In 1810, when the university of Berlin was established, his friends persuaded him to deliver his first lectures on Roman history, which were received with such interest by the hearers, and so much commended by men like Buttmann, Heindorf, Spalding, and Savigny, that he published in 1811 and 1812 the two volumes of his Roman history.

When the Prussians rose against the French he established a journal at Berlin under the title of the "Prussian Correspondent," and in 1814 was sent again to Holland to negotiate a loan with England. On his return in the same year to Berlin he lost his wife, and soon after his father; and to divert his mind under his losses he planned the biography of his father, and edited, together with Buttmann and Heindorf, the fragments of Fronton, found in Verona

by Angelo Maio. In 1816 he married a second time, and was appointed Prussian minister at the papal see; and on his passage through Verona to Rome he discovered, in the cathedral library of the former city, the institution of Gaius. The chief object of his mission was to arrange with the pope the re-organization of the catholic church in the Prussian dominions, which was finally settled by the Prussian concordate, when Prince Hardenberg went to Rome in 1822. The result was the bull *De Salute Animarum*. Pius VII., himself a lover of science, had a great regard for Niebuhr. Even before he went to Italy, his attention had been directed to the importance of the *Codices Rescripti*, and the discovery of Gaius added to his interest in the subject, so that he spent much time in Rome in an accurate examination of the manuscripts of the Vatican library. But when Angelo Maio was appointed keeper of the library, a very ill-placed jealousy on his part towards Niebuhr prevented the latter from continuing freely his learned labours, the result of which he had made known to the world in his collection of unedited fragments of Cicero and Livy; and at a later period, when a good understanding existed again between Maio and Niebuhr, produced by the disinterested frankness of the latter, he took an active part in Maio's edition of the precious fragments of Cicero's "De Republica." His residence in Rome gave him an intimate knowledge of the localities of the city, and a clearer conception of its ancient character and history. He was no doubt more intimately acquainted than any antiquarian of the place with the relics of the ancient city, and to walk with him over the ancient forum was like passing along with a guide from classic times, so clear was the whole scene before his eye. His knowledge in this branch appears in his essay on the increase and decline of ancient and the restoration of modern Rome, which is printed in the first volume of the "Description of Rome," by Bunsen and Plattner. It is also published in his minor works. In this period he also wrote some Latin treatises in the "Atti dell' Accademia di Archeologia," on the Greek inscriptions brought by Gau from Nubia, and a German treatise on the age of Curtius and Petronius in the "Transactions of the Academy of Berlin."

In 1823 he left Rome, and before his return to Germany went to Naples, where he devoted some hours every day to the collation of the best manuscripts of the grammarian Charisius in the library of that city. In Switzerland he remained six weeks in St. Gall, examining laboriously the manuscripts of that library; and if he expected more than he actually found, he at least discovered some remains of the latest Roman poetry,—that is, poems of Mero-baudes. He afterwards settled in Bonn, where the Prussian government had established a university. He wrote here, in the winter of 1823, that portion which is finished of the third volume of his history of Rome. He was appointed a member of the council of state, whose sessions he attended at Berlin. The writer entertains a grateful remembrance of a visit which Mr. Niebuhr paid him at this time, when imprisoned in consequence of a political prosecution, and of his release from confinement obtained through Mr. Niebuhr's intercession. The kindness was greater as Mr. Niebuhr's own political principles were looked on with some suspicion by the men in power. After his return to Bonn he determined to remodel the two

first volumes of his Roman history before publishing the third, as further researches had changed his views in many respects. He now also began to lecture again, and the fees paid for attendance he devoted to prizes for scientific questions, or to the support of poor students. The first volume appeared in 1827, and was so well received that the third edition appeared in 1828. The second volume was, in its new state, finished only a few months before his death; and in the preface he says that the melancholy influence of recent political events upon his mind appears in the mode of the execution of the concluding part of the work. His death took place at Bonn on the 2nd of January, 1831.

NIELD, JAMES.—This benevolent individual was a native of Knutsford in Cheshire, and was born in 1744. Having realized a handsome fortune, he devoted both his time and money to the amelioration of the misery of his fellow-creatures. He visited nearly all the prisons of the United Kingdom, and by the excellence of his example caused many others to follow in his footsteps. Mr. Nield was the founder of the society for the relief and discharge of prisoners for small debts, and acted as treasurer to it for many years. He died, much regretted, in February 1814. He was the author of several works relating to prison relief and discipline.

NIGHTINGALE, JOSEPH, a learned unitarian divine, who was a native of Chawbert in Lancashire, and originally a Wesleyan minister in the town of Macclesfield. His history may be briefly narrated. Leaving his obscure situation in that town, he came to the metropolis, and by the exertion of his literary talents struggled into notice, and contributed not a little to the instruction and amusement of the community. He compiled several of the volumes of "The Beauties of England and Wales," and afterwards published, in 1816, a folio volume, entitled "English Topography, or a Series of Historical and Statistical Descriptions of the Several Counties of England and Wales, accompanied by a Map of each County. By the Author of 'Historical and Descriptive Delineations of London and Westminster, the Counties of Salop, Stafford, Somerset, &c.'" In his preface to this work it is called his twenty-sixth tour through the republic of letters. In the meantime he had succeeded from the Wesleyans, become an unitarian, and published "A Portraiture of Methodism," "Two Sermons Preached at Hanover Street and Worship Street Chapels," 1807; "A Portraiture of Catholicism," 1812; "Refutation of the Falsehoods and Calumnies of a Recent Anonymous Pamphlet, entitled, 'A Portraiture of Hypocrisy.'" He was of a kind disposition, lively imagination, and possessed a cheerfulness that never deserted him to the last. He suffered long from a severe disease, during which, and in the concluding scene, he was well supported by the hopes and consolations of religion. His death took place on the 9th of August, 1824.

NIMROD, a valiant warrior, who, according to the Mosaic account, lived about 2000 B. C., and is generally supposed to have been the first conqueror who substituted the monarchical yoke for the patriarchal independency of the nomadic tribes. Babylon and the monarchy of Nimrod were founded by him, and enlarged by the conquest of the towns of Erech, afterwards Edessa; Accad, afterwards Nisibis; and Calneh, afterwards Ctesiphon, in Mesopotamia. Herder calls him the builder of the tower of Babel, and

considers the representation of him as a powerful hunter merely a figurative designation of the tyranny and artifice by which he subjected and united the wild Nomadic tribes.

NINYAS, an Assyrian king, who was the successor of his mother Semiramis, in the government of the Assyrian empire, and, according to the concurrent testimonies of Diodorus Siculus, Atheneus, Justin, and other historians, abandoned himself to the most slothful inactivity and most vicious self-indulgence; averse to martial exploits, and intent only upon the pursuit of every means that might be supposed capable of conducing to his own gratification, he withdrew from his subjects, with whom he only held occasional intercourse by messages, and shut himself up in his palace with his eunuchs and concubines, and cherished a perfect indifference with regard to the happiness of his subjects or the prosperity of his empire. As a necessary measure of policy, however, he is represented as raising an army out of the different provinces of his empire by a conscription, which he placed under the direction of proper officers. This army was kept at Nineveh and the vicinity, and was annually dissolved and renewed by the substitution of new troops, who were engaged only for a year's service. The design of this arrangement is sufficiently obvious; an army was requisite to his security in case of foreign invasion or civil commotion, and the periodical change provided for in its constitution was calculated to prevent the mischiefs that might otherwise have arisen from a regularly organized conspiracy against his person or power. To an inglorious life succeeded an unlamented death. His successors, however, during the long period of 1,200 years, and thirty reigns, so closely imitated his example, that their history is buried in total obscurity, not even traceable by a single instance of honourable character or great achievement. All is a total blank and waste till we reach the not less contemptible, though more known conduct of the last, perhaps the basest of them all.

NISBET, CHARLES, D. D., first president of Dickinson college, Pennsylvania, was born in 1736, at Haddington, Scotland, and received his education in Edinburgh. For several years he officiated as minister of Montrose, and in 1783, when the college in Carlisle was instituted, was invited to become its president. In 1785 he entered upon the duties of that station, and continued to fulfil them until his death, January 17, 1804, in the sixtieth year of his age. The learning of Dr. Nisbet was very extensive. He was an admirable classical scholar, and particularly conversant with Greek. At one time he could repeat the whole of the "*Æneid*" and of Young's "*Night Thoughts*;" indeed, his power of quotation generally was inexhaustible. He was endowed with genuine wit, and was sometimes inclined to be sarcastic. His sermons were impressive and powerful. In disposition he was sincere, benevolent, and humane.

NOAILLES, one of the oldest noble families in France. Among the members of this family, which have been invested with the first offices in the kingdom, are, Antoine de Noailles, celebrated on account of his embassies under Henry II. The abbe Vertot has published an account of them. His brother, the bishop of Aqs, was also employed on several important and difficult diplomatic missions to England, Italy, and even Constantinople.

Anne Jules, duke of Noailles, was born 1650, and inherited from his father the first company of the *gardes-du-corps*, and in the war of 1689-97 commanded a *corps-d'armee* in Catalonia; in 1693 was made marshal, and in 1694 gained the battle of the Ter against the Spaniards. He died in 1708.

Louis Antoine de Noailles, brother of the preceding, was archbishop of Paris and a cardinal. On account of the aid which he afforded to Quesnel, he was prosecuted by the Jesuits, and especially by Le Tellier, the confessor of Louis XIV. They prevailed on the pope to issue the bull *Unigenitus*, which was resisted by Noailles, as archbishop of Paris, till he was finally compelled to yield in his seventy-eighth year. He died soon afterwards in 1729.

Adrian Maurice, duke of Noailles, son of Anne Jules. He served with distinction in Spain, in the Spanish war of succession, was created grandee of Spain, of the first class, and in 1698 married Françoise d'Aubigné, a niece of Madame de Maintenon. During the minority of Louis XV. he was president of the council of finance, and member of the council of regency, which he left, however, in 1721, rather than concede the presidency to Cardinal Dubois. He was exiled by the influence of that intriguing priest, after whose death he was recalled, in 1723, when he was reinstated in his former offices. In 1734 he served under Berwick in the campaign on the Rhine and at the siege of Philipsburg, and after the death of Berwick received the marshal's staff. In the following year he commanded the French army in Italy. When the Austrian war of succession broke out, after the death of the emperor Charles VI., Noailles received a command on the Rhine. In 1743, by the unseasonable impetuosity of his nephew, the count of Grammont, he lost the battle of Dettingen, and by this means, the fruits of the wise measures by which he had brought the English army to the verge of ruin. His age no longer permitting him to fight at the head of armies, he entered the ministry. With splendid talents he united all the faults of the courtiers of the times. His friendship for Marshal Saxe induced him, although an elder marshal, to serve him as first aide-de-camp in the battle of Fontenoi. His two sons were, in 1775, made marshals of France. After his death the abbé Millot published "*Mémoires Politiques et Militaires pour servir à l'Histoire de Louis XIV., et de Louis XV., composés sur les Pièces originales recueillies par Adrien Maurice, Duc de Noailles,*" &c., which contains interesting information, not only respecting the history of the wars of Louis XIV. and XV., but also respecting the history of Spain, under Charles II. and Philip V.

In later times the following members of this family have rendered themselves distinguished. Louis, viscount of Noailles, a general and member of the first national convention in 1789. Chosen by the nobility a deputy to the states-general, he proposed to his chamber to form an union with the third estate. Montmorency, Rochefoucauld, Lafayette, &c., voted in the affirmative, and, after long debates, forty members of the chamber of nobles united with the national assembly,—Noailles was the first who exhorted the clergy and nobility in the assembly to renounce their privileges as injurious to the common weal. After the dissolution of the constituent assembly he went into the army, and in 1792 commanded the chain of out-posts at Valenciennes. His birth subjected him to suspicion: he demanded his dismis-

sal, and lived in retirement in the country. Under the consular government he returned to the service, and gained distinction in St. Domingo, as general of brigade, under Leclerc and Rochambeau. After the evacuation of the island he embarked on board a vessel of war for Cuba, but was killed in a battle with the English, who took the vessel.

His son Alexis, count of Noailles, was born at Paris on the 1st of June, 1783, and became minister of state of Louis XVIII. He was obliged to leave France in 1811, because he had incurred the suspicions of the imperial government, and for a time lived in Switzerland. The princes of the house of Bourbon sent him on important missions to the German courts, to Russia and to Sweden; after which he repaired to the residence of Louis, at Hartwell, in England. In 1813 he served as aide-de-camp of the crown prince of Sweden, in Germany. After the battle of Leipsic he left the Swedish service, accompanied the allied army to France, and fought at Brienne and La Fere Champenoise; after which he joined the count of Artois at Vesoul, became his aide-de-camp, and was afterwards the plenipotentiary of Louis XVIII. at the congress of Vienna. He returned with the king from Ghent to Paris, was chosen deputy of the chamber of 1815, and in October of the same year was appointed by Louis minister of state, but without any particular department. In 1828 Count Alexis of Noailles was a member of the chamber of deputies, and at the suggestion of the minister Portalis, was appointed by the king member of the commission to examine whether the schools of the clergy, the Jesuits, &c. accorded with the fundamental principles of the French constitution.

Claude Dominique Juste, count of Noailles, cousin of the former, second son of the prince de Poix, born at Paris, August 25, 1777, was one of the first chamberlains of Napoleon, and remained in this post till 1814. After the restoration he was the ambassador of Louis XVIII. at Petersburg, till superseded in 1820 by the count de Ferronays.

NOBLE, MARK, a miscellaneous writer, who was born early in the last century, and was for many years rector of Barming, in Kent. As an author he is well known for his "Memoirs of the Protectorate House of Cromwell," his "Lives of the English Regicides," and his "History of the College of Arms." Mr. Noble died at a very advanced age in 1827.

NOEHDEN, GEORGE HENRY, a learned German writer, who was born, in January 1770, at Gottingen, where he received the rudiments of his education. He subsequently entered the university there, and having completed his studies entered the family of Sir William Milner, as tutor to his children. In October 1796 he accompanied his pupils to Gottingen, having previously spent some years in England, and while there wrote a dissertation entitled "De Porphyrii Scholis in Homerum." In 1800 he published the first edition of his "German Grammar."

In 1814 and 1815 he made an extensive tour on the continent, and in 1818 accepted an invitation to Weimar, to superintend the education of the children of the hereditary grand duke of Saxe-Weimar.

A situation in the British Museum having become vacant, his friends, especially General Milner, uncle to his late pupils, and Lord Milton, exerted themselves so strenuously in his favour, that, notwithstanding a competition of nearly thirty aspirants, he was appointed to the place. For some time he had the care of a portion of the library in that national

establishment; but when in 1821 he published a translation of Goethe's "Observations on Leonardo da Vinci's celebrated Picture of the Last Supper, with an Introduction and Notes," the trustees of the British Museum discerned that he would be more suitably placed in the department of antiquities and coins. That to the study of ancient and modern art, and more especially to numismatology, he had directed his particular attention, was satisfactorily demonstrated by the publication of his "Northwick Coins," which, but for an unfortunate circumstance beyond his controul, would have extended to eight or twelve numbers, but was concluded, about a fortnight before his death, with the fourth number. In 1823, when the Asiatic society was instituted, they chose him their honorary secretary, the functions of which post he discharged with his usual punctuality. Dr. Noehden died rather suddenly on the 19th of March, 1826.

NOLLEKENS, JOSEPH, a talented English sculptor, who was the son of a painter of some eminence. He was born in Dean Street, Soho Square, on the 22nd of August, 1737. At eleven years of age young Nollekens was placed under the celebrated Sheemaker, and under this artist he learned to perform the more laborious and mechanical parts of his profession. The drudgery of the tasks to which he was doomed, and the slender hopes held out to his ambition, seem to have aided his natural inclination for dissipation; and it is said that his habits were as dissipated as his fate appeared to be unpromising. The inconvenience and necessity which resulted from this unlimited indulgence at length brought him back to habits of temperance and industry. He began to apply himself diligently to the study of the works of the ancients, particularly at the duke of Richmond's rooms at Whitehall. Young Nollekens's efforts were rewarded, in the years 1759 and 1760, by premiums from the society of arts for a drawing from the Bacchus of Michael Angelo, and a clay model of his own composition of Jephthah's Vow. In 1762 he also gained the principal prize for a basso relievo in marble, the subject of which was the visit of the angels to Abraham. Feeling that England was not the place in which he could expect to obtain much professional knowledge, and having by this

time saved a sufficient sum of money to enable him to prosecute his studies in Italy, he repaired to Rome, desirous of qualifying himself for what was then the summit of his ambition, the situation of assistant to Mr. Wilton, the sculptor, afterwards for many years keeper of the royal academy. At Rome Mr. Nollekens profited by the instructions of Cavaceppi, a man of considerable note, who behaved very kind to him, not only by giving him the information and advice of which he stood so much in need, but by introducing him to the society of the artists and literati of Rome. Mr. Nollekens's progress in his art now became very rapid, and he soon had the honour of receiving a gold medal from the Roman academy of painting, sculpture, and architecture, being the first premium ever adjudged by that academy to an English sculptor. With that acuteness which distinguished him through life Mr. Nollekens quickly discovered that the want of knowledge of the greater part of the Englishmen who then visited Rome might be turned to good account, and he became a dealer in antiques, and in the modern productions of Roman art. Many reasons concurred to make his assistance sought, both by the needy Italian artists and by the wealthy English nobility; and he at once improved his fortune, gave general satisfaction to his clients of all descriptions, and steadily prosecuted his professional studies. During a residence of nearly nine years at Rome, the company of Mr. Nollekens was much solicited by his countrymen. In consequence he made many, and valuable friends, who, on his return home, kept up his importance in England as they had done on the continent. Some of his best busts were executed at Rome, the only one known of Sterne, and a very fine one of Garrick, and the justly celebrated head of Stephen Fox when an old man, are specimens of his ability at that period of his life. It may be doubted whether Mr. Nollekens ever excelled the last-mentioned work; and yet at that time his price for a bust was only twelve guineas, although it was afterwards gradually increased to a hundred.

Mr. Nollekens, who had taken out with him to Italy only about 200*l.*, brought back above 1600*l.* Soon after his arrival in England he married the youngest daughter of Mr. Justice Welch, with whom he received a very handsome portion. He now took up his abode in Mortimer Street, Cavendish Square, and speedily acquired the celebrity and employment to which his merit, as compared with the sculptors of that day, justly entitled him. The chisel of Mr. Nollekens was chiefly distinguished by its careful and accurate imitation of nature, and by the total absence of that peculiarity of style called mannerism. Although he must always have borne strongly in remembrance the relics of Greek sculpture, and had himself made drawings of all the most celebrated antique statues both at home and abroad, they seem to have had little influence in the formation of his taste. His Venus with the Sandal, upon which he was employed at intervals for above twenty years, is esteemed his *chef-d'œuvre*. His monument to Mr. Howard is also a very fine work of art; but it seems to be generally admitted that his professional reputation must principally rest on his busts. It was probably owing to the deficiencies of his education, and to the force of early habits, that Mr. Nollekens could never boast of much refinement in manners. On the contrary, indeed, although he was very much respected by all who were on intimate terms with him,

the simplicity of his deportment, and the total absence of any attention to the ordinary usages of polished life, afforded them frequent subjects of amusement. As a specimen of his *naïveté*, it is related of him, that, in spite of the previous admonition of his friends, he would go up to his late majesty George IV. when prince of Wales, take him familiarly by the button, like an every-day acquaintance, ask him "how his father did," and express pleasure at hearing the king was well; adding, "Aye, aye! when he's gone, we shall never get such another."

It is frequently forgotten by those who ought to know better, that no man is equal to all things; and that he whose attention has been enthusiastically devoted to one pursuit, must, in many cases, be comparatively ignorant of every other. Such persons would have found an inexhaustible fund of merriment in the difficulty which Mr. Nollekens generally experienced to express in adequate language that which he was nevertheless as capable of feeling as any one. Among many instances of this nature which occurred to him it is said, that when in his youth he was called into the room of the society of arts, and asked by some of the members, who were very much charmed with the sentiment which he had communicated to his group of the Visit of the Angels to Abraham, to describe his idea of the reception which the venerable patriarch had probably given to his celestial guests, his discomposing answer was,—“How d'ye do? how d'ye do?” His severe experience in early life of the value of money rendered Mr. Nollekens somewhat too careful of it for the rest of his days. It was customary with him, even when in full practice, to send the models of his heads to Rome, where the marble busts were rudely prepared from them by some inferior artist, and transmitted to Mr. Nollekens to be finished. By this means the heavy duty on the importation of the unwrought material was avoided. In private life also Mr. Nollekens was considered penurious. It frequently happens, however, that parsimony in trifling matters is found to be perfectly compatible with generosity in things of moment. It was so in a great degree with Mr. Nollekens. While he would hesitate to give half-a-crown to the servant who had brought him a haunch of venison, he would not scruple to put 5*l.* into the hand of any distressed individual. Upon the establishment of the artists' benevolent fund, Mr. Turner, the royal academician, who was the chairman of the committee appointed to forward the object of the institution, called on Mr. Nollekens, and asked for his support; Nollekens hesitated. “Why 'tis but a guinea,” said Mr. Turner; “that is not much, surely.”—“Much!—no.—Of what use is a guinea?—Here,—take thirty.” Such instances of genuine warm-heartedness are enough to balance a thousand oddities of character. Of Mr. Nollekens's personal appearance towards the close of life, the following striking portrait has been thus sketched by the author of “Table Talk:”—“I saw this eminent and singular person one morning in Mr. Northcote's painting-room. He had then been for some time nearly blind, and had been obliged to lay aside the exercise of his profession; but he still took a pleasure in designing groups and in giving directions to others for executing them. He sat down on a low stool (from being rather fatigued); rested with both hands on a stick, as if he clung to the solid and tangible; had an habitual twitch in his limbs and

motions, as if catching himself in the act of going too far in chiseling a lip, or a dimple in a chin; was bolt-upright, with features hard and square, but finely cut; a hooked nose, thin lips, an indented forehead, and the defect in his sight, completed the resemblance to one of his own masterly busts. He seemed by time and labour to 'have wrought himself to stone.'"

Few artists indeed have ever laboured with more persevering assiduity than Mr. Nollekens. He continued to do so until one morning in February, 1819; when, while sitting at breakfast, he received a violent paralytic stroke, which for a time deprived him of speech and of the use of his left hand; and on the 23rd of April, 1823, at about half-past one o'clock he expired, being then in the eighty-sixth year of his age. He had been much convulsed during the night, but breathed his last tranquilly, and in full possession of his senses.

**NOLLET, JOHN ANTOINE**, a distinguished cultivator of natural philosophy and natural history, who was born at Pimbré, near Noyon, in 1700. He received his first instruction at Clermont and Beauvais, and then went to Paris, where he became intimate with Réaumur, Dufay, Duhamel, and Jussieu. In 1738 Count Maurepas first established a professorship of experimental physics for Nollet, who was also made member of several scientific societies. To extend his acquaintance with science, he came to England and also visited Italy. In 1744 he was appointed to instruct the dauphin in experimental physics at Versailles. He employed himself particularly in experiments on electricity. Nollet died at Paris in 1770. His treatise on the "Hearing of Fish" is particularly esteemed. He also wrote "Leçons de Physique Expérimentale," and "L'Art des Expériences."

**NON, JEAN CLAUDE RICHARD DE SAINT**, an artist of considerable ability, who was born in 1727. He was a member of the academy of painting and sculpture at Paris, and was principally celebrated for his "Voyage Pittoresque de Naples et de Sicile." Besides the engravings published with his travels, he also published a number of engravings from antiques and works of Le Prince, Boucher, and Fragonard. He died at Paris in November 1791.

**NORDEN, JOHN**, an English topographical writer, who was born in Wiltshire in 1548, and received his education at Hart Hall, Oxford. His principal works are, "England, an Intended Guyde for English Travellers;" "A Description of Middlesex and Hertfordshire;" "A Delineation of Northamptonshire;" "A Topographical and Historical Description of Cornwall;" "The Surveyor's Dialogue," &c. His death took place in 1626.

**NORDEN, FREDERIC LEWIS**, a modern traveller, who was sent by the king of Denmark to various parts of Europe, for the purpose of acquiring information in the art of ship-building. By the command of the same monarch he also went to Egypt; and on his return published a work entitled "Travels in Egypt and Nubia." He was also the author of several other works. His death took place at Paris in 1742.

**NORGATE, EDWARD**, a celebrated illuminator of the seventeenth century, who was also a Windsor herald, and one of the clerks to the signet. One of his best productions, as a work of art, is "The Original Patent of the Government of Nova Scotia, granted by Charles I. to Lord Stirling." He died in 1650.

**NORRIS, JOHN**, an English divine, who was born in Wiltshire in 1657. Having completed his education he entered holy orders, and obtained the living of Bemerton, in Wilts, where he died in 1711. Dr. Norris was a controversial writer. Among his numerous publications we may mention his "Picture of Love Unveiled," "An Idea of Happiness," and his work "On the Love of God."

**NORTH, BROWNLOW**, an English prelate, who was born in 1741, being brother to the celebrated Lord North. He was educated at Trinity college, Cambridge, where he received the degree of M.A. in 1760, and in 1770 he was promoted from a canonry in Christchurch to the deanery of Canterbury. His eldest brother being now prime-minister, he obtained the mitre of Lichfield and Coventry in 1771, at the early age of thirty. In 1774 his lordship was next promoted to the bishoprick of Worcester; soon after which he was translated to the rich see of Winchester, which is allowed to be the second in the kingdom in point of emolument. By his wife, a lady once well known to the fashionable world, he had a numerous family, of whom both sons and sons-in-law were amply provided for by valuable livings in the church. This venerable prelate died at his palace in Chelsea, after a long illness, on the 12th of July, 1820. He was the editor of the "Miscellanea Sacra."

**NORTH, FRANCIS, BARON GUILDFORD**.—This nobleman, who is better known by his title of Lord Keeper, was born in 1640, and after a close application to the study of the law, became solicitor-general in 1671. He was raised to the peerage in 1683, and died in two years afterwards. His "Philosophical Essay on Music" is a good work.

**NORTH, FREDERIC, EARL OF GUILDFORD**, a celebrated English statesman, who was born in 1732, and received his education at Trinity college, Oxford, after which he spent some time at Leipsic. On his return he obtained a seat in the house of commons, and having entered warmly into politics, he was raised to several valuable government posts, and finally became premier. He did not long remain at the head of affairs, as his administration was by no means popular. His lordship, who was much esteemed in private life, died in 1792.

**NORTH, GEORGE**, an antiquarian writer, who was born in London in 1710, and educated at Cambridge, where he received the degree of M.A. in 1744. He was the author of "A Table of English Silver Coins from the Conquest to the Commonwealth with Remarks," and several other works of a similar character. His death took place in 1772.

**NORTH, JOHN**, a learned English ecclesiastic, who was born in 1645. He was educated at Cambridge, and in 1672 became professor of Greek. His writings, which are principally from Plato, are now but little read.

**NORTH, ROGER**, a distinguished biographical writer, who was attorney-general in the reign of James II. He published a life of his brother the lord-keeper, as well as those of other members of his family. His "Examen" is a well written work, and he died soon after its appearance in 1733.

**NORTHCOTE, JAMES**, a highly gifted English artist, who was born at Plymouth in 1746, where his father was a watchmaker. He was intended for the same employment, but he evinced so strong a predilection for the fine arts that, through the inter-

vention of a gentleman residing in his native town, he was placed under Sir Joshua Reynolds. He accordingly came to London in 1771, and devoted himself entirely to his new profession. After five years' study he quitted his preceptor, and commenced portrait painting on his own account with great success. However, his imagination led him to study the higher branches of art, and, in furtherance of this object, in 1777 he repaired to Italy, where he remained about three years; during which time he was elected a member of the imperial academy at Florence, of the ancient Etruscan academy at Cortona, and of the academy Del Forti at Rome. He was also requested to make a portrait of himself, to be placed among the distinguished artists which grace the gallery at Florence. Mr. Northcote returned to this country in 1780; having visited on his way all the repositories of the Flemish school.

Soon after his return he was employed by Mr. Boydell to design subjects for engravings. One of the most admired, entitled the Village Doctress, had for several years a considerable sale. It was, in fact, by familiar subjects of this class, painted from their prototypes in nature, and thus circulated by the aid of engraving, that a general feeling in favour of the graphic arts was first excited throughout the country. About the year 1786 a plan was suggested to form a collection of pictures illustrative of our great dramatic author, Shakspeare, which were to be publicly exhibited, and then published in a splendid folio volume. Mr. Boydell at once adopted the proposal for this great national undertaking, and gave employment to almost every distinguished painter in England.

It was this memorable event that enabled Northcote to develop his powers. The public excitement at the opening of the Shakspeare gallery exceeded the expectations of even the most sanguine.

Amongst the many splendid efforts of British art which were thus collected together, none were more justly attractive than the compositions of Northcote. The scene of the smothering of the royal children in the Tower of London; that of taking their bodies secretly by torch-light for interment at the foot of the stone steps; the subject of Arthur and Hubert; and others by his pencil, certainly may be reckoned amongst the best specimens of the state of British art at that period. Northcote had now attained to the zenith of his fame, and he received the reward of it by being elected an associate of the royal academy on the 6th of November, 1786, and a royal academician on the 13th of February, 1787. Mr. Northcote from this period divided his professional labours among historical composition and portraiture. He also painted a series of moral subjects, illustrative of virtue and vice, in the progress of two young women. It would seem that these were intended to rival the works of Hogarth, but, although the main points of this graphic drama bore directly upon the subject, the characters were certainly wanting in that great and most essential property—expression; to say nothing of the general deficiency of the series in the painter-like execution, which is so admirably displayed in the *marriage-a-la-mode* and other works of Hogarth. It is evident that Mr. Northcote never painted but with his mind's eye steadily fixed upon the colouring of Sir Joshua; although he not unfrequently fancied that he was proceeding like Titian, Rubens, or Vandyke. His sojourn in Rome, and

his visits to other parts of Italy, wrought so little change in his style that no one could discover the least appearance of that severity of manner which is so peculiar to the Roman and other Italian masters; and which may be quoted in obvious contradistinction to the style of the British school. His pictures are distinguished for their fine breadth of light and shade; and most of his historical works display an extensive and accurate acquaintance with the subject treated, much study, and that force of conception which is the true characteristic of genius. For a period of above thirty years his productions may be said to have borne a conspicuous part in the exhibitions at Somerset House; and, even till within the last year of his life, a season rarely elapsed at the British institution, or the gallery of the British artists, without presenting one or more efforts of his pencil. So strong was the feeling of devotion which Mr. Northcote entertained for his art, that he used frequently to say, that "If Providence were to leave me the liberty to select my heaven, I should be content to occupy my little painting-room, with a continuance of the happiness I have experienced there; even for ever." In that same little painting-room, in his house in Argyll Place, he pursued his art for nearly half a century, in peace and unmolested. His habits were economical; and his time was valued with correspondent care; for, devoted as he was to conversation, he worked and talked at the same time, and did not pay, but only received visits for the sake of a gossip. He had much of the cynical spirit, too prevalent with artists, and with the members of other professions, of depreciating the works and characters of their fellow-labourers; yet he was one of those philosophers who at the same time do not forfeit the name of philanthropists,—kind-hearted men who, notwithstanding their accomplishments in the art of reviling any body that crosses their path, are yet ready to go out of the road to do a kindness for any body.

At length the day approached that was to terminate Mr. Northcote's long and tranquil life. "On the 7th of July," says a gentleman who had been intimately acquainted with him for above thirty years, "I paid my respects to him, and found him sitting at the window of his bed-room alone. I had not been to see him before for two months. He said he was glad to see me, and asked why I had not come sooner. My excuse was that I knew he was much surrounded with friends, and it appeared to me necessary that some should keep in the back-ground. He thought it very considerate, and then talked of the death of poor Jackson, a man he liked equally to any one living or dead. All this time was taken up in seeking for his snuff box, and as soon as he got it he gave me a steady look in which I saw a difference from that I had been accustomed to for thirty years. It was more dejected than the Ugolino by Sir Joshua. He said, 'Well, now you're come, what think'st of me: do I look like a long inhabitant for this world, or like a visiter for the next?' At this moment Miss Northcote, who is nearly of the same age as her brother, came into the room and heard my answer, which was that I never saw him so reduced in flesh. 'Oh! but you don't flatter me,' he cried, 'my friends say that I look better.' A knock was heard at the street door; it was his doctor and I took my leave, my friend desiring I would come again soon: but I never saw him more or heard of him until the fourth day

after his decease. Some years since Mr. Northcote said to a friend that "he looked upon me as a son." I may in return observe that in him I have lost a father. He has been pleased to remember me in his will, and I should feel grateful for any opportunity of testifying my gratitude.

"In a conference with Mr. Northcote's old and faithful servant, Mrs. Gilchrist, I have been given to understand that on the 8th of July, 1831, her master became very feeble and required her whole attention for his comfort; yet, although he was as helpless as an infant, he retained his senses and thanked her for her kindness, remarking that he could not have supposed there was a person on earth with so much feeling. He was conscious of his rapid dissolution and desired her to retire to rest; but her feelings were too acute for sleep and her mind was bent entirely on restoring his health,—but all was useless. In the morning of the 13th Mrs. Gilchrist raised her master to give him some tea; but he swallowed little, and the yoke of an egg with difficulty. For twelve hours he remained very quiet, and expired at twenty minutes after eight o'clock in the evening."

**NORTHESK, LORD.**—This brave naval commander was born in 1760, and being early destined for the naval profession, he embarked in 1771 with the honourable Captain Barrington in the *Albion*. He next served with Captain Macbride in the *Southampton*. He was subsequently placed under Lord Rodney, and was promoted by that celebrated naval commander in April 1780. He was advanced to the rank of post-captain in April 1782, and appointed to the command of the *Eustatius*, in which he was present at the reduction of the island of that name. From this ship he was ordered into the *Enterprise* frigate, in which he returned to England, and was paid off at the peace in 1783. In 1787 he married Miss Rickets, niece of the earl of St. Vincent, and in the following year succeeded his eldest brother as Lord Rosehill.

In 1792, on the demise of his father, his lordship succeeded to the title and estate; and in January 1793 he commissioned the *Beaulieu* of forty guns, and went to the Leeward Islands, whence he returned with a convoy in the *Andromeda*, which was soon afterwards put out of commission.

In 1796 his lordship was appointed to the command of the *Monmouth* of sixty-four guns, and employed in the North Sea, under the orders of the late Lord Viscount Duncan, until May 1797, when the spirit of disaffection, which had originated in the Channel fleet, unfortunately spread to that squadron; and the *Monmouth* was one of the ships brought to the Nore. In 1800 Lord Northesk was appointed to the *Prince* of ninety-eight guns, in the Channel fleet, under the command of the earl St. Vincent, in which ship he continued till the peace in 1802, when he again returned from active service, and the same year his lordship was re-elected one of the sixteen peers of Scotland.

On the renewal of hostilities with France in 1803, his lordship was among the foremost to offer his services, and was immediately appointed to the *Britannia* of 100 guns, in which he served in the Channel fleet under the command of the honourable Admiral Cornwallis, till May 1804, when he was promoted to the rank of rear-admiral of the White squadron. In the following month he hoisted his flag in the same ship, and continued to serve in her on her

former station in the arduous blockade of Brest, during the trying and tempestuous winter of 1804, and till August in the following year; when he was detached with a squadron, under the orders of Vice-admiral Sir Robert Calder, to reinforce Vice-admiral Collingwood off Cadiz.

In the decisive battle of Trafalgar the *Britannia* had the honour of bearing his lordship's flag, and took a distinguished share in achieving the victory. Previous to that great event it had been directed by the commander-in-chief, in consequence of her heavy rate of sailing, that the *Britannia* should constantly take a position to windward of him; and on the morning of that day he ordered, by signal, that she should assume a station as most convenient, without regard to the order of battle; and afterwards sent verbal directions to Lord Northesk by the captain of the *Sirius*, to break through the enemy's line astern of the fourteenth ship. This was effected in the most masterly and gallant manner, though the *Britannia* was severely galled in bearing down by a raking fire from several of the enemy. On passing through the line and hauling up, she was the fourth ship of the van-division in action (the *Victory*, *Temeraire*, and *Nep-tune*, also preceded her), and in a short space of time completely dismasted a French ship of eighty guns, who waved a white handkerchief in token of submission. She afterwards singly engaged, and kept at bay, three of the enemy's van ships that were attempting to double upon Lord Nelson's flag ship, the *Victory*, at that time already warmly engaged with two of the enemy, and much disabled. During this long and bloody conflict the noble admiral zealously emulated the conduct of his illustrious leader, displaying the most heroic courage, tempered by the coolest judgment and presence of mind; he was ably seconded in his exertions by his gallant captain, Charles Bullen. Nor was his conduct after the action less meritorious; while his skill and promptitude were equally conspicuous in the arduous task of securing the captured ships. His majesty, in testimony of his approbation of his eminent services, honoured his lordship with the red riband; and both houses of parliament, the corporation of London, and several other cities and public companies, concurred in voting him their thanks on this occasion.

On the 5th of June, 1806, the noble admiral had the honour of being invested by his majesty with the order of the Bath; and on the 4th of June, 1814, he was promoted to the rank of admiral of the Blue. He died at an advanced age.

**NORTON, FLETCHER**, a learned English lawyer, who was born in January 1716. Having completed his studies he entered his profession with great promise of success, and in 1761 was appointed solicitor-general to the king, and honoured as usual with knighthood. In November 1763 he succeeded to the still more important post of attorney-general, and in 1769 became chief justice in Eyre, south of Trent, which appointment was a sinecure; meanwhile Sir Fletcher had obtained a seat in the house of commons, having been returned for different boroughs during several successive parliaments. At length, in consequence of his residence at Womersley near Guilford, he formed a connexion with the corporation and freemen of the latter place, in consequence of which both he and his children afterwards became its representatives. In 1770 he was chosen speaker, a high and honourable office, which he filled with no small share

of dignity. Indeed he is said to have given offence, by his bold and manly conduct, towards the close of the American war, when on presenting certain money bills at the bar of the house of lords, he expressed a wish to the sovereign in person, "that what his faithful commons had granted liberally his majesty might spend economically." Sir Fletcher Norton was advanced to the peerage in 1782, and died in 1789.

**NORWOOD, RICHARD**, a geometrician, who measured a degree of the meridian in this country. This undertaking was executed in 1635, the operations being carried on between London and York. Mr. Norwood was the author of "A Treatise on Trigonometry," and some other works of the same character. His death took place in 1699.

**NOTKER**, surnamed Labeo, a learned monk of St. Gall, who died about 1022, and left a translation of the Psalms, with notes, in high German, one of the most important monuments of the oldest German prose. The manuscript is at St. Gall. The work is printed in Schilter's "Thesaurus."

**NOTT, JOHN**, an elegant poet and philological writer, who was born in Worcester on the 24th of December, 1751. At a very early period, while at school, he evinced his taste for poetic composition in some happy translations from the Latin classics. He studied surgery first at Birmingham, and then removed to London to finish his education under Sir Cæsar Hawkins, with whose family he had become connected. In 1775 an invalid gentleman was entrusted to his care, with whom he spent two years on the continent. On his return he applied himself to his professional pursuits in London; but in 1783 he went as a surgeon on board an East Indianman to China, and remained absent from England about three years. It was at this period that he learned Persian; and his beautiful translation of some of the Odes from Hafiz offered a convincing proof of the proficiency he made in that language. On his return to England he declined entering into any medical engagements, that he might attend his brother and his family to the continent, whither, on account of health, they were obliged to go. He came back in 1788, and then took his degree in medicine; and soon after attended the then duchess of Devonshire, and Lady Duncannon, as their physician, to the continent. With that family he remained connected, more or less, till 1793, when he came back to the hot-wells at Bristol, to which city he became so attached that no offer of greater emolument elsewhere could tempt him to change his situation. During the last eight years of his life he suffered from a painful state of paralysis, amounting to hemiplegia. This confined him almost wholly to the house. His mental faculties, however, were active; and he amused himself in revising his unfinished compositions, and in arranging plans for a new work, which, had his life been spared, he proposed to execute. So perfect were his memory and judgment, that when, about a month previous to his decease, a person applied to him whom he had attended many years before, on hearing the symptoms detailed, he reverted to the prescriptions he had originally given, described what the medicines were, and their proportions, directing them to be again applied, which was done with complete success. So attentive was he to the interests of others, that as he was in the habit of having the service read to him every Sunday, he desired this might be done by the son of his servant in preference to any of his other attendants,

saying, "It would give the lad early habits of piety, and attach him to the offices of the church of England." Dr. Nott died in 1826, and his remains were deposited in the old burial ground at Clifton.

Dr. Nott was the author of several popular and instructive works. Among them we may enumerate, "A Chemical Dissertation on the Thermal Waters of Pisa, and the Acidulous Spring of Asciano," "The Poems of Caius Valerius Catullus, in English verse, with the Latin Text versified, and Classical Notes," "The First Book of Titus Carus Lucretius on the Nature of Things, with the Latin Text," "The Lyrics of Horace, with the Latin Text revised," "On the Influenza, as it prevailed in Bristol and its Vicinity, in the Spring of 1803," "Petrarch, a Selection from his Odes and Sonnets, translated with Notes," and "Select Poems from the Hesperides, or Works, both Human and Divine, of Robert Herrick."

**NOVERRE, JOHN GEORGE**.—This reformer of the art of dancing in Europe was born at Paris in 1727. His father was an adjutant in the army of Charles XII., and he was destined for the military profession; but his taste led him to prefer dancing to fighting, and he became the pupil of the celebrated dancer, Dupré. After attracting the notice of royalty in his own country he went to Berlin, where he was equally well received. He returned to France in 1746, and composed for the comic opera his Chinese ballet, which made no extraordinary sensation. He afterwards produced other works of the same kind, and acquired so much celebrity that Garrick invited him to England, where his talents attracted great admiration. Returning to France he published, in 1760, "Lettres sur la Danse," in which he started some new ideas, and proposed a radical reformation of his art. He afterwards became master of the revels to the duke of Wurtemberg, with whom he continued some years, and then held a similar office at Vienna. He went to Milan on the marriage of the arch-duke Ferdinand, and also visited the courts of Naples and Lisbon, where his merit was rewarded with the cross of the order of Christ. After a second journey to London, Noverre entered into the service of Marie Antoinette, queen of France, who appointed him chief ballet-master of the royal academy of music. He suffered greatly at the revolution, and passed the later years of his life in indifferent circumstances. His death took place in November 1810.

**NOY, WILLIAM**, a learned English lawyer, who was born at St. Burian in Cornwall, and received his education at Exeter college, Oxford. Having completed his studies, he entered Lincoln's Inn, and was shortly afterwards called to the bar. In his profession he rendered himself remarkable by a cynical temperament and unbending sternness, which subsequently rendered him a powerful instrument in the hands of the court. Having obtained a seat in the house of commons in the reign of James the First, he distinguished himself by his constant opposition to the court measures. But in the following reign he was appointed attorney-general, upon which he instantly veered round and became one of the most powerful supporters of that prerogative which he had so often before laboured to abridge. The fatal project of attempting to raise supplies by what was called "ship money," is said to have originated in him. He did not, however, live to witness the whole of the misery which followed, as his death took place in 1634.

**NUGENT, ROBERT, CRAGGS, EARL OF.**—This noble poet was a native of Ireland, and educated in the catholic faith. He was, however, converted to the protestant religion, and obtained a seat in the house of parliament. He was the author of several poems of considerable merit, and it was to Lord Nugent that Goldsmith addressed his poem entitled "The Haunch of Venison." He died in 1789.

**NUGENT, THOMAS,** a miscellaneous writer, who was the author of "Travels through Germany," "Observations on Italy and its Inhabitants," a French and English Dictionary, and a life of Benvenuto Cellini, besides several other works. He was for many years a fellow of the antiquarian society, and died in London in 1772.

**NYE, PHILIP,** an English nonconformist divine, who distinguished himself in the parliament of Charles I. He was born in 1596, and took his degree in Magdalen college, Oxford, after which he became minister of St. Michael's church, Cornhill. His resistance, however, to Laud compelled him to escape to Holland, where he remained for some years. He subsequently returned, and became conspicuous in all the controversies of the period. He died in 1673.

**OATES, TITUS.**—This notorious individual was born in 1619 and educated at Cambridge. He afterwards entered holy orders. Subsequently to that event, however, he turned catholic, and then again made a profession of the protestant faith, when, in conjunction with a Dr. Tongue, he gave information to the government of a pretended plot of the catholics, formed for the purpose of overturning the protestant religion, and falsely accused several catholic families of distinction, many of whom suffered death. Strange to say, this infamous character was rewarded with a pension of 1200*l.* per annum. On the accession of James II. he was indicted for perjury, condemned to stand five times in the pillory every year of his life, and to be whipped from Aldgate to Newgate, and thence to Tyburn; the last part of his sentence was executed with extraordinary severity. He, however, recovered, and at the revolution of 1688 he obtained a pension of 1000*l.* a year. His death took place in 1705.

**OBERLIN, JOHN FREDERICK.**—This extraordinary French ecclesiastic united to the duties of a pastor of a poor protestant flock in the wildest parts of the Waldbach, attainments which made his neighbourhood the theatre of civilization; and his life affords a striking instance of the amazing effects which spring from religious precepts when sanctioned by high moral rectitude. He was born at Strasbourg in 1740, and after receiving a good education in his native city became domestic tutor in the family of a surgeon, who initiated him into the mysteries of the healing art.

In 1766 the chaplainship of a French regiment was offered him; and, as he saw in it a prospect of great and extensive usefulness, alike gratifying to his sense of duty and his consciousness of a power which would enable him to govern the minds of men, he determined upon accepting the office. He accordingly left his situation, and took for his lodging a little apartment up three pair of stairs, entering upon a preparatory course of reading. At this time a curacy in the Ban de la Roche or Steinthal became vacant—a mountainous canton in Alsace, forming part of the western ramification of the Haut Champ, or Champ de Feu, which is an isolated range de-

tached by a deep valley from the eastern boundary of the chain of the Vosges mountains. It consists of two parishes; Rothau is one; the other, which had now become vacant, comprised three churches, and the five hamlets of Fondai, Belmont, Waldbach, Bellefosse, and Zolbach, inhabited almost exclusively by Lutherans. One privilege the inhabitants possessed in common with the other Alsacians,—that entire liberty of conscience to which men are entitled by the law of nature and of right reason, and which, having been warranted to them when Alsace was incorporated with France, had not been violated, not even when the resolution was taken and acted upon of exterminating protestantism from all other parts of the kingdom. The Lutherans owed this to their numerical strength and to the neighbourhood of Germany, not to any other principles of policy in the French government, nor to the royal faith of Louis le Grand. But the benefit of that privilege had long been, as it were, in abeyance among the Lutherans of the Ban de la Roche. Their unhappy district had suffered during the thirty years' war, and in subsequent wars had been almost laid waste; so that when Oberlin, who was unanimously elected to the ministry, came amongst them as their pastor, he had to teach his flock to read before they could acquire any knowledge of the sacred scriptures from their own exertions. Oberlin's mother went with him to arrange his domestic establishment, and then left him there with his younger sister, Sophia, in charge of it. About a year afterwards, Madeleine Witter, a friend and relation of the family, came to visit Sophia, and remained some weeks at the parsonage. She was the daughter of a professor in the university of Strasbourg, but had lost both parents at a very early age. Her understanding was good, and her mind highly cultivated; but though deeply imbued with religious principles, she was at this time more expensive and worldly in her habits than her cousin Frederick, and their dispositions did not entirely harmonize. But we must quote a passage from an interesting life of Oberlin, which will best illustrate his views of the immediate interposition of Providence in this matter:

"The time of Madeleine's departure drew nigh—a day was fixed for it; and only two days before that appointed one Oberlin heard a voice within him which whispered, 'Take her for thy partner!' We are told that he resisted the call, and said in reply to it, almost aloud, 'It is impossible—our dispositions do not agree!' 'Take her for thy partner!' said the secret voice again;—and that 'the wish was father' to that voice no one will doubt, though Oberlin did not confess it to himself, and, perhaps, did not suspect it. 'He spent a sleepless night; and in his prayers the next morning solemnly declared to God, that if He would give him a sign, by the readiness with which Madeleine should accede to the proposition, that the union was in accordance with His will, he would cheerfully submit to it, and consider the voice he had heard as a leading of Providence.'"

The delusions which minds in a feverish state of devotional excitement practise upon themselves are seldom so harmless as in Oberlin's case. The tenour of his prayer must imply that he was about to make a proposal of marriage without feeling any predilection for the person to whom it was made; and that he bound himself to fulfil the engagement, if it should be accepted, only because in so doing he should be submitting to the will of Providence; and

thus solemnly engaging in that fanatical prayer to do, on this special consideration, what, in the supposed predicament, he could not without breach of honour and faith, violation of feeling, and deserved loss of character, have left undone. The biographer who mentions the particulars of his various courtships "merely because they are so thoroughly characteristic," and interposes nothing like one warning word concerning the perilous enthusiasm there exemplified (though such warning is especially needful for that class of readers to whose hands the book was most likely to find its way), proceeds to relate, that after breakfast the same morning, Cœlebs found the young lady sitting in a summer-house in the garden—it was a late spring or early summer, in a lovely scene; and we may suppose in such lovely weather as makes a summer-house inviting. Losing but little time in preliminaries, he placed himself beside her, and began what the biographer terms a conversation, though it consisted in one pithy speech:—"You are now about to leave us, my dear friend. I have had an intimation that you are destined by the divine will to be the partner of my life. If you can resolve upon this step, so important to us both, I expect you will give me your candid opinion about it before your departure."

This new method of courtship proved a short way to matrimony: it allowed Miss Witter eight and forty hours for deliberation—but instead of lessening the grace of her acceptance by delaying it, she "rose from her seat, and, blushing as she approached him, placed one hand before her eyes, and held the other towards him: he clasped it in his own," and thus the decision was made. Their marriage speedily followed; and, while it lasted, it was happy even to the full measure of their desires. Mrs. Oberlin became an invaluable assistant to her husband in all his labours of beneficence; tempering his zeal with her prudence, and forwarding his benevolent plans by her judicious arrangements.

Had there been more sympathy between them here, there would have been less fitness in their union; for, as a worldly-minded husband might have secularised and deadened her heart, so might a wife of enthusiastic religious feelings have excited him to go beyond the bounds of possible utility in the ardour of his benevolent zeal. But they were so well assorted, that the natural disposition of each tended to counteract the besetting sin of the other, and both were thus guarded against the errors into which they might else not improbably have fallen.

"Confident," says his biographer, "that strength would be afforded if rightly sought, Oberlin resolved when he entered on his cure to employ all the attainments in science, philosophy, and religion, which he had brought with him from Strasbourg, to the improvement of the parish and the benefit of his parishioners." He began his measures for civilizing the people as one who rightly perceived that by bettering their social condition he should promote their moral, and thereby prepare a way for their spiritual improvement. All the roads belonging to the *Ban de la Roche* were impassable during the greater part of the year; and the only mode of communication from the greater part of the parish with the neighbouring towns was by stepping stones over the *Bruche*, a stream which, having its sources in these mountains, falls into the *Ill* before it reaches Strasbourg. It was thirty feet wide at the crossing place;

but in winter the way is described in Oberlin's life to have been along its bed;—those who know what mountain streams are in winter may suspect some error here in the compiler. Being thus insulated, as it were, in their own valley, the inhabitants had no vent for their produce, had there been a surplus to dispose of; they had accustomed themselves in consequence to be contented with a bare and wretched subsistence; they had not even the most necessary agricultural instruments to aid them in obtaining this, and were without any means of procuring them. This was their state when Oberlin assembled them, and proposed to open a communication with the high road to Strasbourg by blasting the rocks, constructing a solid wall to support a road about a mile and a half in length along the banks of the *Bruche*, and building a bridge across that river near *Rothau*.

The peasants were astonished at such a proposal; they looked upon it as utterly impracticable, and all began to excuse themselves on the score of having as much private business on their hands as they could get through. They talked of difficulties, and raised objections, to which Oberlin replied by reminding them that they were shut up in their own villages nine months out of the twelve; whereas, if this road were made and the river bridged, they would at all times have an open intercourse with the neighbouring district; they would always have a market for their produce,—they might then supply themselves with many most useful things of which they now felt the want, and they would have the means of providing comforts for themselves and their children; and he concluded by saying, "Let those who see the importance of all this come and work with me!" and with that, shouldering a pickaxe, off he set with a faithful servant to begin the work. The effect of his speech and of his example was such that the peasants are said not only to have desisted from their opposition, but with one accord to have hastened for their tools and then followed him. He appointed to each his task, reserving for himself and his man the most difficult or dangerous places. This spirit spread through the whole parish; implements were wanted for the number of willing hands; he procured them from Strasbourg, and, as expenses accumulated, he obtained funds through the exertions of his friends. Walls were erected to support the earth wherever it was likely to give way; mountain-torrents, which had hitherto inundated the meadows, were diverted into courses, or received into beds sufficient to contain them; a neat wooden bridge, which at this day, though sixty years have elapsed, still bears the name of "*Le Pont de Charité*," was thrown over the *Bruche*; and at the commencement of 1770, a year and a half after Oberlin's marriage, the whole task was completed, and a communication with Strasbourg opened.

The peasants now experienced the benefit of his zealous exertions for their welfare, and cheerfully engaged in his next project,—that of forming roads between the four villages of his parish, which were till this time in a state of savage separation. The spirit of well-directed industry that had thus been raised, made the *Steinthal* a lively and an animating scene. "The pastor, who on the Sabbath had directed their attention with that earnestness and warmth wherewith his own soul was filled, to 'the rest that remaineth for the people of God,' was seen on the Monday, with a pickaxe on his shoulder, marching at the head of two hundred of his flock.

Such was the uncivilized state of the parish, and indeed of the adjacent country, that tools and implements of husbandry could not be purchased nor even repaired at any nearer place than Strasbourg; two days therefore must be spent in going thither and returning; and as the same causes which had hitherto kept the people in barbarism had kept them poor, they had no money for such emergencies. Oberlin's whole income did not exceed a thousand francs, but if ever man was "passing rich with forty pounds a year," he was so. "Spend, and God will send," seems to have been his maxim,—not in the spend-thrift, reckless, and senseless use of the saying, but in the spirit of one who believed that "he who hath pity upon the poor lendeth unto the Lord." He stocked a warehouse in Waldbach with these articles, and gave the purchasers credit; and he established a sort of lending fund, under the strict regulation that those who did not punctually replace the loan on the prescribed day were to lose for a certain time the privilege of borrowing from it again. These things could not have been done without assistance from his friends in Strasbourg; but Christian friends will never be wanting to such men for such objects. His next measure was to select some of the handiest of the elder boys and send them to Strasbourg, there to learn the respective trades of carpenter, mason, glazier, cartwright, and blacksmith; these, when they returned to the Steinthal, trained up others, and their earnings circulated in the parish, which was another advantage gained. Most of their habitations were wretched cabins quarried in the rocks, or burrowed in the sides of the mountains: comfortable cottages were now erected under Oberlin's superintendence, and cellars constructed deep enough to preserve their potatoes from the frost.

These valuable esculent roots were then their staff of life. It seems incredible what is here given as the account which old men assured Oberlin they had received from their fathers,—that till the year 1709 the people of this canton subsisted chiefly upon wild apples and pears. The sufferings which they endured that year from famine made them, it is said, perceive the necessity of providing for their subsistence instead of trusting like savages to the spontaneous production of the soil; so they cleared part of the forest and introduced potatoes. These had so far degenerated through careless cultivation, that fields which had formerly from 120 to 150 bushels, now yielded only from thirty to fifty; and the people imputed this to the exhaustion of the soil instead of to their own neglect: there was, indeed, this apparent ground for their complaint, that the rains had washed away the soil in many places, and they had taken no means either to prevent this or to repair the mischief. Oberlin procured seed from Lorraine, Switzerland, and Holland, and instructed the people from Parmentier's useful work in the culture of this root. He had acquired a thorough knowledge of botany during his residence in M. Ziegenhagen's family, and thus he was able to make them acquainted with the properties of such of those indigenous plants as could be used for food, for physic, or for any of the useful arts.

He tried to raise sainfoin, but this plant requires a deeper soil than covers the rocks and sandstone of the Steinthal. That soil agrees with potatoes; and this root succeeded so well under a good system of culture that it furnished them not only with a suffi-

cient store for home consumption, but with a surplus which became, and has continued to be, a profitable article of exportation. Dutch clover, also, which he introduced, succeeded well, and flax, which he raised from seed from Riga. One of his favourite maxims was, "Let nothing be lost;" and nature was never followed more carefully in observance of this principle than by Oberlin. He taught his people not only how to manage their manure in the best manner, but to convert leaves, rushes, moss, and cones from the pine forest into a compost; and he paid children a certain price for tearing up old woollen rags and cutting old shoes into pieces for the same purpose. Never was there a more practical utilitarian; nothing escaped his indefatigable attention, and nothing was beneath it; and the manner in which he induced his parishioners to profit by his lessons shows a degree of patient prudence which is seldom found connected with so much ardour and enthusiasm. Ignorant people are never more obstinate in ignorance than when any attempt is made to improve those practices in husbandry which they have learned from their fathers. They acknowledged Oberlin's genius as a road-maker; but they could not believe that their pastor, who had spent all his life in Strasbourg, could understand the management of fields and gardens so well as themselves. Being well aware of this, he prepared a practical lesson, without giving them any cause to suspect it was intended for their instruction. There were two gardens belonging to the parsonage, each crossed by a frequented footpath; one of these, which was noted for the poverty of its soil, he converted into a nursery, where, having well prepared the ground, he planted slips of apple, pear, plum, cherry, and walnut-trees; in the other he dug trenches four or five feet deep, in which he planted young fruit-trees, and surrounded them with such soil as he considered best adapted to them. In this work, a favourite and intelligent servant, the same who had been his aide-de-camp in road-making, was his sole assistant. The trees flourished in the course of their sure growth,—this being a work which, when well performed, is liable to no casual disappointment. The people, as he expected, could not help observing this, and wondering at the difference between the state of their pastor's garden and of their own; and at length they questioned him, to his wish, how it was that such fine trees had been made to grow in such an unfavourable soil? Oberlin, according to his custom of connecting every incident with religious considerations, first directed their thoughts to Him "who causeth the earth to bring forth her bud," and who "crowneth the year with his goodness." He then reminded them that all the benefits of nature were not gratuitously bestowed on man, and explained to them that this was one of those cases in which, according to their labour, would be their reward. Those who wished to follow his example—and it was soon generally followed—were supplied with young trees from his nursery; grafting became a favourite employment, when he had instructed them in it; gardening, a favourite recreation. "The very face of the country underwent a complete change; for the cottages, hitherto, for the most part, bare and desolate, were surrounded by neat little orchards and gardens; and, in place of indigence and misery, the villages and their inhabitants gradually assumed an air of rural happiness."

Having thus been the Vertumnus and Bacchus of

the Ban de la Roche, he next became its Triptolemus. He represented to the farmers that they might obtain a double advantage by stall-feeding their cattle and converting their least productive pastures into plough lands; for thus they might raise grain for themselves instead of purchasing it, and would have an increase of butter, which they might export. The nature of the country presented a serious objection to one part of this plan, for there was much work for the pickaxe before the plough could be employed, and in many places rocks were to be blasted and soil to be carried thither. Except, indeed, in the cost of labour, little else was sacrificed in the experiment, some of the grass lands being cultivated to so little purpose "that it is said the wife could carry home in her apron all the hay her husband had mown in a long morning." Oberlin, as usual, put in practice what he advised. The plan answered his highest expectations, and was followed with good success; and in the eleventh year of his ministry Oberlin formed an agricultural society in the parish which he had found almost in a savage state. The pastors of the neighbouring towns, and some of his other friends, assisted it by becoming members. He connected, or, in later language, affiliated it with that at Strasbourg, whereby he obtained the communication of periodical works; and the Strasbourg society placed 200 francs at the disposal of this auxiliary body, to be distributed among those peasants who should most distinguish themselves in planting nursery grounds and grafting fruit trees.

The school-house, which was the only regular one in the five villages, had been constructed of unseasoned wood; Oberlin found it in a ruinous state, nor could he have persuaded the overseers of the commune to repair it unless he had formally engaged that no part of the expense should fall upon the parish funds. Some money he collected among his friends at Strasbourg, with which, though far from sufficient for the purpose, he began; for neither personal considerations, nor the fear of being unable to meet contingent expenses, ever deterred him from putting into execution schemes of usefulness. He had an unbounded confidence in the goodness of his heavenly Father; and was convinced, as he often said, that if he asked for any thing with faith, and it was really right that the thing should take place, it would infallibly be granted to his prayers. Too much of such faith is better than too little, and Oberlin never acted upon it to a dangerous extent. In this case, as in that of the roads, there was a present and tangible good; the building was completed without material injury to his own slender finances: in the course of a few years a similar one was erected in each of the other four villages, the inhabitants coming voluntarily forward and taking the trouble and cost upon themselves.

As Oberlin had observed with concern the disadvantages to which the younger children were subjected, whilst their elder brothers and sisters were at school, and their parents busily engaged in their daily avocations, he laid down a plan for the introduction of infant schools also; probably the very first ever established, and the model of those subsequently opened at Paris, and still more recently in this country. Observation and experience had convinced him, that, even from the very cradle, children are capable of being taught to distinguish between right and wrong, and of being trained to habits of subordina-

tion and industry; and in conjunction with his wife he therefore formed *conductrices* for each commune, engaged large rooms for them, and salaried them at his own expense. Instruction, in these schools, was mingled with amusement; and whilst enough of discipline was introduced to instil habits of subjection, a degree of liberty was allowed which left the infant mind full power of expansion, and information was conveyed which might turn to the most important use in after-life. During school hours the children were collected on forms in great circles. Two women were employed, the one to direct the handicraft, the other to instruct and entertain them. Whilst the children of two or three years old only were made at intervals to sit quietly by those of five or six who were taught to knit, spin, and sew; and when they were beginning to be weary of this occupation, their conductress showed them coloured pictures relating to Scripture subjects, or natural history, making them recite after her the explanation she gave. She also explained geographical maps of France, Europe, or the Ban de la Roche, and its immediate environs, engraved on wood for the purpose, by Oberlin's directions, and mentioned the names of the different places marked upon them: in addition to this, she taught them to sing moral songs and hymns. Thus she varied their employment as much as possible, taking care to keep them continually occupied, and never permitting them to speak a word of Patois.

"With minds thus stored and trained by discipline the children, when arrived at a proper age, entered what may be called the public schools, and the masters were relieved and encouraged in their duties (which, in such a situation, were sufficiently arduous) by the progress they had already made. Reading, writing, arithmetic, geography, the principles of agriculture, astronomy, and sacred and profane history, were regularly taught in the higher schools; but although Oberlin carefully superintended the whole proceedings, he reserved for himself, almost exclusively, the religious instruction of this large family. Every Sunday the children of each village, in rotation, assembled at the church to sing the hymns they had learned, to recite the religious lessons which they had committed to memory during the week, and to receive the exhortations or admonitions of their common father."

Oberlin's first object was to ground young people well in their Christian faith,—thus laying his foundation on the rock of ages: his next was to give them that kind of instruction which might render them most capable of enjoying a country life. Part of their school exercises was to extract from the best authors short essays on agriculture and the management of fruit trees; these they committed to memory, and were examined in them at the yearly examination. They were taught to know as well the properties and uses as the names of plants; and in summer were allowed to ramble in search of those with which they had become thus scientifically acquainted in their winter lessons. The Ban de la Roche is so rich in plants that it contains about a seventh part of the whole known French Flora; and they pursued this study with the more delight because they formed botanical gardens of their own in little spots of ground which their parents allotted them for this useful and salutary amusement. They were taught, also, to draw the flowers from nature, in which some are said to have succeeded remarkably well; and sometimes

an appropriate text from Scripture was written upon the drawing, and thereby pleasurably infixed in their minds. Before they received religious confirmation, they were expected to bring a certificate from their parents that they had planted two young fruit trees in a spot described. The first fruit from these trees was presented to Oberlin, and the day on which that offering was made was a festival. A similar custom prevailed in the neighbouring parts of Germany, where no farmer was allowed to marry till he had planted and was "father of a stated number of walnut trees, that law being inviolably observed," says Evelyn, "for the extraordinary benefit which the trees afford the inhabitants." What the Germans thus provided for by a wise law, Oberlin required as an act of religious duty, bringing that great principle into action on all occasions.

In the sixteenth year of his marriage Oberlin lost his wife, with whom he had lived in uninterrupted happiness. She died almost suddenly, leaving him with seven out of nine children, the youngest only ten weeks old. Nothing in his life is more characteristic than his behaviour on this occasion. The first information so overpowered him, for it was wholly unexpected, that he was unable to give utterance to his feelings, and remained awhile as if in a state of melancholy stupor; he then fell on his knees, and returned thanks to God that his beloved partner was now beyond the reach or need of prayer, and that her heavenly Father had crowned the abundance of his mercies toward her by giving her so easy a departure. They had prayed, in the joint prayer which he composed upon their marriage, that they might always have death before their eyes, and always be prepared for it; "and if it be a thing," they added, "which we may ask of thee, oh grant that we may not be long separated one from another, but that the death of one may speedily, and very speedily, follow that of the other." The composure with which he bore her loss, though not produced by an expectation that this part of their prayer was about to be granted, was certainly affected by it, for to such a persuasion he had wrought himself. Accordingly, six months after her death he composed an address to his parishioners, and laid it aside to be delivered to them after his own, as his dying charge. After briefly stating when and where he was born, when he entered upon his cure, the time of his marriage, and the number of his children, "two of whom," he said, "have already entered paradise, and seven remain in this world," he named the day on which his wife, although in apparently good health, had been taken from him. "Upon this occasion," he proceeded, "as upon a thousand others in the course of my life, notwithstanding my overwhelming affliction, I was upheld by God's gracious assistance in a remarkable manner. I have had all my life a desire, occasionally a very strong one, to die; owing, in some degree, to the consciousness of my moral infirmities, and of my frequent derelictions. My affection for my wife and children, and my attachment to my parish, have sometimes checked this desire, though for short intervals only. I had, about a year since, some presentiment of my approaching end. I did not pay much attention to it at the time, but, since the death of my wife, I have frequently received unequivocal warnings of the same nature. Millions of times have I besought God to enable me to surrender myself with entire and filial submission to his will, either to live or to die; and to bring me

into such a state of resignation, as neither to wish, nor to say, nor to do, nor to undertake any thing, but what He, who only is wise and good, sees to be best. Having had such frequent intimations of my approaching end, I have arranged all my affairs, as far as I am able, in order to prevent confusion after my death. For my dear children, I fear nothing; but, as I always greatly preferred being useful to others to giving them trouble, I suffer much from the idea that they may occasion sorrow or anxiety to the friends who take charge of them. May God abundantly reward them for it! With regard to the children themselves, I have no anxiety, for I have had such frequent experience of the mercy of God towards myself, and place such full reliance upon his goodness, his wisdom, and his love, as to render it impossible for me to be at all solicitous about them. Their mother was, at a very early age, deprived of her parents, but she was, notwithstanding, a better Christian than thousands who have enjoyed the advantage of parental instruction. Besides this, I know that God hears our prayers; and ever since the birth of our children, neither their mother nor I have ceased to supplicate him to make them faithful followers of Jesus Christ, and labourers in his vineyard. And thou, O my dear parish! neither will God forget nor forsake thee. He has towards thee, as I have often said, thoughts of peace and mercy. All things will go well with thee. Only cleave thou to him, and leave him to act. Oh! mayest thou forget my name, and retain only that of Jesus Christ, whom I have proclaimed to thee. He is thy pastor; I am but his servant. He is that good master, who, after having trained and prepared me from my youth, sent me to thee, that I might be useful. He alone is wise, good, almighty, and merciful; and as for me, I am but a poor, feeble, wretched man." The strength of this illusive hope of death, for hope it was, continued not merely to console, but to exhilarate him, till time produced insensibly its sure though slow effect.

No particulars of Oberlin's life have been preserved for nine years after his wife's death. During the revolution, he was, like the rest of the clergy, deprived of his scanty income. That income was probably derived from some collective fund for the maintenance of the protestant clergy. To supply its failure the heads of the parish agreed to make an annual collection of 1400 francs for him, by going from house to house; but their utmost exertions during the year 1789 could not raise 1150, and in the ensuing year not so much as 400, and during those years these sums constituted nearly his whole revenue, for no fees were received. He used to say his people were born, married, and buried, free of expense, as far as their clergyman was concerned. In the former of those years he was cited before the supreme council of Alsace, upon a charge of having induced his parishioners to enlist in the emperor Joseph's service. The court not only acquitted him, but expressed its regret that one, whose time was so beneficially employed, should have been called from his sphere of utility upon such an accusation. Evidently it was altogether groundless: Oberlin's hopes and feelings were with the revolution. What good man was there who did not, at its commencement, hope that some great improvement in human affairs was about to be effected,—that an end would be put to the enormities of civil and ecclesiastical usurpation,—that the abuses of existing systems would be abated; and that the

institutions of society, which hitherto had added more or less, in every part of Christendom, to the miseries of life, would thenceforth be mainly directed towards improving the moral and intellectual condition of mankind?

During the reign of terror, the Ban de la Roche alone, it is said, seemed to be an asylum of peace in the midst of war and carnage. Revolutionary madness appears not to have spread its infection widely among the people of Alsace, who are described as being remarkable for their industry and love of order, for their hereditary simplicity of habits, their probity, their respect for the laws, and their sense of duty. During these dreadful times, when every kind of worship was interdicted, and when almost all men of learning, talents, and property in Alsace were imprisoned, Oberlin was allowed "to continue his work of benevolence and instruction unmolested;" even while his brother, the professor, was in prison. His house became a retreat for many of different persuasions and of distinguished rank, from Strasbourg and its environs, whom he received cordially, without regarding the danger to which he exposed himself. This safety seems to have been owing in part to the extreme poverty of his parish, which offered no temptations to rapacity; in part, perhaps, to that respect, which even wickedness sometimes involuntarily renders to eminent virtue; partly, also, to Oberlin's enthusiasm in the national cause. His eldest son, Frederic, entered the army as a volunteer, and was one of the first who were killed; this loss he bore, not with that lightness or elasticity of mind which, after it has given way to the first emotions of passionate sorrow, flies from all painful thoughts; nor in the spirit of that hard and hardening philosophy, which submits with sullen strength of pride to what is irremediable. Oberlin's resignation was of a different and happier kind; it was an entire submission to that Providence which, having made all things in goodness, ordereth them in mercy: to the will of that Providence he made his own will conform, as far as is possible for human infirmity; and, regarding death as the passage to a state of immortality, had, in his Christian belief, a consolation which no human philosophy can impart.

The population of the Ban de la Roche increased under Oberlin's care from eighty or a hundred families, which he had found there, to some 3000 souls. Agriculture, and the branches of labour connected with it, could no longer afford employment for the inhabitants. An invalid captain, whom the pastor had relieved, and who had learned to plait straw for his own subsistence, introduced this useful occupation among them; they were taught to knit also (that it should be needful to teach this, shows the extreme rudeness of their former state), and to use dyes extracted from the plants of the country. Oberlin succeeded likewise in persuading them to spin cotton by hand; he encouraged this by giving prizes to the best spinners, in addition to their wages; and in one year this brought into the parish, from one manufacturer, 32,000 francs. Weaving followed, and was likely to prosper, when the march of intellect brought machinery into some of the neighbouring villages, and both spinners and weavers were then reduced to great distress. In 1813 things were at the worst. M. Legrand, of Basle, who had been a member of the Swiss directory, remedied this evil, by persuading his two sons to remove their manufactory of silk ribbons

from the Upper Rhine to the Steinthal; and as the allies, in their first invasion, took possession of the workshops, the sons removed accordingly, without hesitation or delay. This manufacture appears to have brought with it no evil, because the ribbon-looms were distributed in the houses, so that the children remained with their parents; while, in the Legrands, it brought to Oberlin the best of neighbours, and assistants, and friends. The ex-director (how immeasurably happier than in the days of his political elevation!) lived there with his wife, his two sons, and his sons' wives, under the same roof, but each pair in its own dwelling; and an English lady who visited them says, that "so comfortable and complete a house and family could rarely be met with in any country." Employment having thus been secured for the population, the visitations of Providence seem to have been the only affliction which either Oberlin or his people endured from that time. They suffered scarcity in the years 1816 and 1817—the effect of most unfavourable seasons—and then, as on a former occasion, the potatoes which Oberlin had introduced preserved them from perishing; and the knowledge which the parishioners had acquired from him of the nature and properties of every indigenous plant is said to have proved at that time most useful to them, in preventing or relieving "many distressing diseases." He himself was for some time the general physician in his parish; he had learned how to open a vein during his abode with M. Ziegenhagen, and had also made himself acquainted with the routine of the profession in ordinary cases. When the great increase of population increased his other duties, he transferred this part of his functions to his son Charles, and to a young man whom he had sent to study at Strasbourg. Whatever may have been the success of Oberlin's medical practice, he succeeded in relieving his parishioners from a chronic lawsuit of more than eighty years' standing. It was concerning the right of the forests which covered the greater part of the mountains; this right was contested between the peasantry of the Ban and the seigneurs of the territory; and, as the revolution, which swept away so many feudal rights, left this subsisting, the long litigation had impoverished both parties, and had greatly impeded the improvement of the district. It was so great an evil that Oberlin placed over one of his doors this inscription—"O God, have mercy on the Steinthal, and put an end to the lawsuit!" At length the prefect of the Lower Rhone, M. de Lezay Marnesia, who knew and loved Oberlin, requested him to bring about an accommodation, by persuading his parishioners to abate their pretensions, and consent to an agreement which would be advantageous to both parties. Without the sanction of the prefect's authority, Oberlin knew it would be impossible to effect this, and therefore had never before attempted it. He undertook it now, warmly but wisely, pressing upon his parishioners, in private, the policy of thus adjusting so costly a dispute, and urging upon them, in public, the exercise of that Christian charity which suffereth long, and seeketh not its own, and beareth all things. His advice was followed: a compromise was made to the satisfaction and benefit of both parties; and the pen with which the prefect signed the definitive agreement was, at his suggestion, presented by the mayors in deputation to their pastor, with a request that he would suspend it in his study, as a trophy of the victory

which his habitual beneficence had, under the blessing of God, enabled him to gain over old animosities and angry feelings. He often said, that the day on which that pen was used was one of the happiest of his life.

For his exertions at these times, and for the great and manifest improvements which he had made in the condition of the Ban de la Roche, Louis XVIII. sent him the ribbon of the legion of honour; and the royal agricultural society voted him a gold medal. When Count François de Neufchâteau proposed this vote, he said, "If you would behold an instance of what may be effected in any country for the advancement of agriculture and the interests of humanity, friends of the plough and of human happiness, ascend the Vosges mountain, and behold the Ban de la Roche!" His benevolent exertions were thus acknowledged in his own country; while the religious principles from which those exertions proceeded, and by which they were sustained, made his character more highly as well as more justly appreciated among that—not inconsiderable—part of the British public to whom his name was known.

Old age came gently on this venerable man. His strength failed, so that he no longer left his home, except for urgent motives; but his body was not bent, neither were his senses dulled; he devoted more time than he had done during his more active years to composition, and the last essay on which he was engaged was for the purpose of giving a more cheerful and consolatory picture of old age than Cicero. At length, in the eighty-sixth year of his age, he was seized with shiverings and faintings; fit succeeded fit during four days; on the fifth morning he lost his speech; he was still able to take off his cap, join his hands, and raise his eyes for the last time toward heaven, his countenance beaming the while with faith, and joy, and love; he then closed them for ever, and soon afterwards departed in peace.

O'BIERNE, THOMAS LEWIS, an Irish prelate, who was born in the county of Longford, Ireland, in the year 1748. Being of a catholic family, his father, who was a farmer, sent him with his brother to St. Omer's to be educated for the priesthood. The latter complied with his father's wishes; but Thomas O'Bierne, while investigating the grounds of his religion, saw reasons for renouncing his in favour of that of the established church. He also entered into orders in that communion; and it is a singular fact, that the two brothers officiated, after a lapse of years, in the same diocese, the one as a zealous member of the catholic church, and the other as a prelate of the protestant establishment. Mr. O'Bierne became, at the commencement of the American war, chaplain in the fleet under Lord Howe; and the calamitous fire at New York in 1776 gave him an opportunity of displaying the doctrines of Christianity in the most consolatory manner, having been appointed to preach at St. Paul's church, the only one in New York which had been preserved from the flames. On his return from America, when the conduct of Lord Howe and his brother, Sir William Howe, became the subject of general animadversion and parliamentary inquiry, Dr. O'Bierne published a pamphlet in vindication of them. About this time also he wrote a spirited pamphlet in their favour, called "The Gleam of Comfort," which possessed much merit. His connexion with the Howes introduced him to the late duke of Portland, whom he accompanied as

private secretary to Ireland in 1782. On that occasion, however, Dr. O'Bierne obtained no preferment; but the year following his patron presented him to two valuable livings in Northumberland and Cumberland. When Earl Fitzwilliam went to Ireland he took the doctor with him as his first chaplain; soon after which he was promoted to the bishopric of Ossory, from which, on the death of Mr. Maxwell, he was translated to the see of Meath. When Earl Fitzwilliam was removed from office, Bishop O'Bierne stood forward in the Irish house of peers in his defence. The bishop was distinguished as a political writer, and it is but justice to say, that his conduct as a prelate was both liberal and exemplary. His first charge as bishop of Ossory is perhaps unexampled in point of pastoral simplicity and apostolic doctrine. He candidly admitted the obscurity of his birth, and made a solemn declaration, that, in the ecclesiastical promotions which were at his disposal, he should be influenced by the merits of the candidates only. He instituted monthly lectures, on topics of religious controversy and subjects selected from "The History of the Church," while chapters from the New Testament were occasionally translated, and the most approved commentators and expositors were carefully consulted. It was not uncommon during these lectures to see them attended by clergymen, from a distance of twenty or thirty miles, who probably had not, for twenty or thirty years, looked into the original text.

As a preacher, Dr. O'Bierne ranked in the first class. His sermons seldom related to the thorny points of controversial theology, which are more calculated to confound than to enlighten. He was generally satisfied with expatiating on the grand and essential doctrines of Christianity, and his diction was perspicuous, animated, and nervous. This prelate died in 1822.

OCCAM, WILLIAM, an English divine of the fourteenth century, who was educated at Merton college, Oxford, where he studied under the celebrated Duns Scotus, whose opinions he, notwithstanding, controverted, becoming the founder of the philosophical sect of the nominalists as Scotus was of the realists. Occam entered holy orders, and became a monk. He died in 1347. He was the author of several works; one of the best known is his "De Ingressu Scientiarum."

OCHTERLONY, SIR DAVID, a brave military officer, who was born on the 12th of February, 1758, at Boston in New England. Having completed his education, he was sent to India as a cadet and was made a lieutenant in 1781. In January 1796 he rose to the rank of captain, in 1800 to that of major, and in 1803 was created lieutenant-colonel. In the arrangements for disconcerting the great Mahratta confederacy to expel the British, and acquire an ascendancy by the possession of the person of Shah Alum, the nominal sovereign of Delhi, Lieutenant-colonel Ochterlony was attached to the grand army under General Lake, as deputy adjutant-general. He was consequently present at the great battle of Delhi on the 11th of September, 1803; which event restored the descendant of the Moghul emperors, and exalted the character and prowess of the British army in the estimation of the native powers. Immediately after the battle of Delhi, Lieutenant-colonel Ochterlony was nominated envoy, or resident, at the court of the emperor Shah Alum, where, the following

year, he resisted, with Lieutenant-colonel Burn, a desperate attempt of Holkar's troops under Scindia, to recover possession of Delhi; and at the same time he had to control a restless and discontented populace. For this well-performed service he obtained the governor-general's "earnest thanks and unqualified approbation." Peace being completely re-established in this quarter, a gentleman of the civil service was appointed to succeed him at the court of Delhi, and the lieutenant-colonel was nominated to command the fortress of Allahabad. From this inactive situation he was removed, in 1809, to command a force assembled on the north-west frontier to oppose some hostile demonstrations of the Seiks. With that force he established a position on the banks of the Sutuleje.

On the 1st of January, 1812, he was promoted to the rank of colonel, and on the 4th of June, 1814, to that of major-general. For a series of years the Nepaulese had been making encroachments on the British dominions, which, not being vigorously resisted at first, they were encouraged to continue. At length a remonstrance was made to the court of Catmandoo on the subject, and commissioners were appointed, on the part of both states, to examine jointly the pretended rights of the Nepaulese to the lands which they had acquired. The result of this enquiry was a complete refutation of all their pretensions, and the production of the most satisfactory evidence of the violence with which their acquisitions had been obtained; but, notwithstanding this, they continued to evade on various pretences the demands of the British government for restitution. The consequence of this dispute was that war was declared by the British.

The plan of the campaign was by a variety of operations undertaken at once, to wrest the country suddenly from the Nepaulese. With this view it was intended that the principal division of the army should move from Palna on the capital, by the route of Etonde and Chusapanee; while a similar force should penetrate into Gorkah, by the route of Roots-wild, and prevent the transfer of the war to the westward.

The only part of this plan that can be considered as having been attended with complete success, was that entrusted to Major-general Ochterlony, who had to contend with a country of great difficulty, and with an enemy who throughout the campaign displayed a degree of energy, of genius, and of resource, unprecedented in a native leader; by a series of operations gradually forced him from post to post, and at length cooped him up, and compelled him to surrender in the almost inaccessible fortress of Mallown. He was, however, destined to gain still brighter distinctions in this war. Although a treaty had been signed by the rajah's deputies, the rajah refused to ratify it, and the British troops again took the field: the chief command was now given to Major-general Ochterlony, whose skilful conduct on the occasion was rewarded by still higher promotion.

In April 1815 he was created a knight-commander of the Bath, being one of the company's first officers who received that honour. In November 1815 he was raised to the dignity of a baronet. At a court of directors of the East India company, held on Wednesday, the 6th of December, 1815, a report from the committee of correspondence having been read, it was resolved unanimously that, "in consi-

deration of the eminent and most beneficial services rendered to the company by Major-general Sir David Ochterlony, Bart., and K.C.B., in the war against the state of Nepaul, by which the honour of the British arms was upheld, and the enemy, after the capture of extensive provinces important to them, were obliged to sue for peace on terms favourable to the company, a pension of 1000*l.* per annum be granted to him, to commence from the date of the victory over the Nepaulese army, the 16th of April, 1815: the said grant being subject to the approbation of the court of proprietors."

Sir David Ochterlony subsequently distinguished himself in the great Mahratta and Pindarry war of 1817 and 1818. Sir David had a principal command, the superintendence of the fifth division, under the immediate orders of Brigadier-general Arnold, to whom he soon transferred the command, in order to undertake the difficult task of settling the distracted province of Rajpootana, for which purpose he was invested with large discretionary powers.

In December 1817 he concluded a treaty with the Patan chief, Ameer Khan, and gained over all the petty chiefs in that quarter to the British interest. In April 1818 he was appointed resident at Rajpootana, with the command of the troops. In December the same year he was again appointed to the residentship of Delhi, with Jeypore annexed, and to the command of the third division of the grand army. In 1822 he was entrusted with the superintendence of the affairs of Central India, as resident and political agent in Malwah and Rajpootana. Towards the latter end of 1824 the political dissensions in the state of Jeypore obliged Sir David Ochterlony to take the field, but an adjustment of affairs prevented the necessity of any active effort.

His health, after nearly fifty years of uninterrupted service, at length became impaired, and in June 1825 he was constrained to resign his high political office, with the intention of proceeding to Calcutta, and thence to England; but going for change of air to Meerut, he there died on the 15th of July, 1825.

OCKLEY, SIMON, a learned oriental scholar, who was born in 1678, and received his education at Cambridge, where he took his degree of M. A. In 1780 he published "The Life of Hai Ebn Jaafar Ebn Tophail," and in less than a twelvemonth after, his great work, entitled "The History of the Saracens, illustrating the Religion, Rites, Customs, and Manners of that Warlike People," in addition to which, he was the author of "Introductio ad Linguas Orientales." He died in 1757.

ØHLENSCHLAGER, ADAM.—This dramatic poet has added glory to Denmark, his country, and indeed to all Scandinavia, by his poetical works, which embody the histories and sagas of the north. Germany also claims him, because his finest poems are in German. His verse has strengthened the connexion between the literature of the two nations. Øhlenschläger passed his youth at the castle of Fredericsberg, near Copenhagen, where his father was governor. In 1800 he commenced the study of the law, but soon after abandoned the legal profession, and, at the expense of the Danish government, travelled through Germany, France, and Italy. He was afterwards appointed professor of æsthetics at the university of Copenhagen, where he also took a part in the direction of the theatre. In 1816 he repeated his journey through the same countries, and pub-

lished a description of them. In Germany he first became known by the dramatic fable of "Aladdin, or the Wonderful Lamp." His serious dramas are still more celebrated—"Palnatoke," "Hakon Jarl," "Axel und Walburg," and his drama of "Correggio." He wrote also several dramatic poems in the German language, as "Ludlam's Cave," "Freya's Altar," the "Shepherd Boy," "Starkother," "Erich und Abel." We also owe to him a new translation of Holberg's comedies. His rifacimento of the old German romance, the "Island of Felsenburg," appeared under the title of the "Islands in the South Sea." His lyric poems and his novels are inferior to his dramatic works. In Danish literature Cehlenschläger introduced a new and bold style, resembling the German, and which, as well in praise as in blame, has been called the romantic.

OGDEN, SAMUEL, an English divine, who was born at Manchester in 1716, and educated at St. John's college, Cambridge. On entering holy orders he obtained several good church preferments, the last of which was Stansfield, in Suffolk, where he died in 1778. His sermons, which were published during his life, are short, animated, and striking.

OGILBY, JOHN, a Scottish author, who was born in Edinburgh in 1600. He was apprenticed to a dancing-master, but owing to a sprain which he received he was unable to follow that profession. After suffering many painful vicissitudes he at length overcame his want of literary education, so far as to be able to translate the works of Homer. He afterwards erected a printing-office in London, and was appointed the king's cosmographer and geographic printer. He printed several volumes of a large atlas, and also "An Account of the Great Cross-roads of the Kingdom," from his own surveys.

OGILVIE, JOHN, a Scottish divine, who was born in 1733, and educated at the university of Aberdeen. He ranked high among the divines and authors of his day. Among his numerous publications we may mention his "Critical Observations on Composition," his "Theology of Plato," and his "Examination of the Evidence of Prophecy in behalf of the Christian Religion."

OGINSKI—the name of an illustrious Polish house. One of the most distinguished members of it was Michael Casimir Oginski, who fought against the Russians; but the fate of his unhappy country obliged him to flee. He constructed the canal which bears his name, and united the Baltic and the Black Sea, entirely at his own expense. He died, seventy-two years old, in Warsaw, in 1803.

Michael Cleophas Oginski was born in 1765. He was foreign minister at the Hague, and fought on the side of Kosciusko in 1794. At a later period he acted as the agent of the patriots in Paris and Constantinople. Alexander permitted him in 1802 to return. In 1810 he was appointed senator and privy counsellor; but in 1815 he went to Italy, where his compositions, particularly his "Polonaises," are celebrated for their beauty.

OGLETHORPE, JAMES EDWARD, an English general officer, who was born in London in 1698, and educated at Oxford. In 1733 he distinguished himself by his exertions to found the colony of Georgia, for which he obtained the royal charter. He also conducted a body of emigrants to that province, at which time he was accompanied by the two Wesleys. In 1734 he returned, with an Indian boy

in his suite, and in 1736 revisited Georgia with another band of emigrants, and proceeded very successfully in the settlement of the colony. As commander of the English forces in Georgia and Carolina he repelled the attempts of the Spaniards. In 1745 he was made major-general, and was employed to follow the rebels under the pretender. The private character of General Oglethorpe was extremely amiable, and he has been eulogized by Thompson, Pope, and Dr. Johnson.

O'HARA, KANE, an Irish dramatist of considerable talent, who was a younger brother in a good family. His first work was "Midas," it was brought out at Covent Garden, and remarkably well received. His other works are, "The Golden Pippin," "The Two Misers," and "Tom Thumb."

O'HIGGINS, BERNARDO.—The father of this celebrated military leader was Don Ambrosio O'Higgins, an Irishman, who rose to be president and captain-general of Chile, and afterwards was appointed viceroy of Peru in 1796, by the title of marquis of Osorno, and discharged the duties of his office with uncommon success and popularity. Don Bernardo first became distinguished in the Chilean revolution in 1812, when he joined the Carreras in the capacity of captain of militia, and received the rank of lieutenant-colonel of the line, and soon afterwards of brigadier-general, as a reward for the important services which he rendered in the command of guerilla parties. In 1813, the Carreras being taken prisoners by the Spaniards, the command of the army devolved on O'Higgins, as senior officer, and he availed himself of the opportunity to assume the civil authority also. The Carreras, however, soon regained their liberty, and compelled O'Higgins to relinquish his usurped power and resume his station under them. After the battle of Rancagua, which was fought October 1814, in which the Chileans were defeated, the Carreras, O'Higgins, Rodriguez, and other prominent patriots, crossed the Cordillera, and took refuge in Buenos Ayres. The government of the latter country, being aware that their own safety demanded the expulsion of the Spaniards from Chile, gradually assembled a sufficient body of troops at Mendoza, to be united with the Chilean refugees, and placed under the command of General Jose de San Martin, for the liberation of Chile. One of the divisions was commanded by O'Higgins. They encountered and beat the royalists at Chacabuco, in February, 1817, after which O'Higgins, by the influence of San Martin, was raised to the office of supreme director of Chile. He continued to direct the government of Chile until January, 1823, when he was compelled to resign the supreme authority, in consequence of the indignation of the people against the arbitrary conduct and shameless peculations of Rodriguez, his minister of finance, and was succeeded by Don Ramon Freyre. He remained in exile several years, although a party existed in Chile in his interest. In 1826 the island of Chiloe revolted in his favour, at the instigation of the troops; but the insurrection was suppressed and punished. After his banishment O'Higgins occupied himself in the cultivation of a very fine estate, presented to him by the Peruvian government in the time of San Martin's protectorate. His integrity and patriotism were highly esteemed, notwithstanding the errors of judgment which led to his being deprived of power.

O'KEEFE, JOHN, a celebrated dramatist, who

was born in the city of Dublin, and intended for the profession of an artist. He however entertained so strong a passion for the drama, that he obtained an engagement at the royal Dublin theatre, where he acted for some years. He subsequently became an author as well as actor. His first production of any importance was a farce entitled "Tony Lumpkin," which met with great success. Soon after this he left Ireland, and on his arrival in London applied for an engagement; but his services as an actor were declined. He then devoted himself entirely to dramatic composition, and produced a number of pieces in rapid succession.

It is remarked in the "Biographia Dramatica" that "it would be unfair to criticise this author by prescribed dramatic rules, as his writings have been indebted to no rules, ancient or modern. They were written to make people laugh, and they have fully answered that intent. With this species of talent has O'Keefe gladdened the hearts of his auditors, and sent them laughing to their beds. He has often done more; he has been the constant advocate for virtue; and in many of his little pieces he has given sketches of character, which, though unfinished, can boast of much originality—some passages that warm and meliorate the heart, and others which mark no mean attention to life and manners."

In the year 1800, being reduced by blindness and other misfortunes to a state of great embarrassment, Mr. O'Keefe obtained a benefit at Covent Garden theatre, when the first piece performed was his "Lie of the Day." At the end of the second act Mr. Lewis led the author upon the stage, and he there delivered a poetical address, in which humour and pathos were very happily blended. At a subsequent period it is stated that his circumstances were so far improved that he was enabled to return a donation sent to him by the literary fund society—an action which reflects the highest credit upon his honourable feelings. Mr. O'Keefe died, much regretted, early in 1833.

OKEN, LOUIS, a learned German writer, and one of the most active and ingenious naturalists of his day. We cannot say much, however, in praise of his systems of the philosophy of nature. In 1816 he began a journal called "The Isis," to which he intended to give an encyclopædic character. As the government of Saxe Weimar then allowed the press greater freedom than other German states, many complainants selected this journal as their organ. Oken, whose views were liberal, printed such complaints whenever they were of general interest. The consequence was, that the government of Saxe Weimar was compelled, by the great powers of the German confederacy, to make him discontinue the "Isis," or discharge him from the professorship. Oken chose to give up the latter, and continued to live in Jena with few interruptions. In 1827 he was made professor in the new university of Munich, where he gave lectures. He is the chief founder of the excellent society of German naturalists, and his activity is apparent from the list of his works. They consist of—"Outlines of the Philosophy of Nature, of the Theory of the Senses, and the Classification of Animals founded thereon," "Biology," a text-book for his lectures, "Oken's and Kieser's Contributions to Comparative Anatomy and Physiology," "On the Signification of the Bones of the Cranium," "On the Universe, a Continuation of the System of the Senses,"

"First Ideas towards a Theory of Light, Darkness, Colours, and Heat," "Sketch of the Natural System of Metals," "On the Value of Natural History," "Origin and Cure of Hernia Umbilicalis," "Manual of the Philosophy of Nature," "Manual of Natural History," "New Armament, New France, New Germany," "Natural History for Schools."

OLAVIDES, DON PABLO, count of Pilo, a learned Spaniard, who was born at Lima in Peru, in 1740, and went at an early age to Madrid, where his talents and activity soon raised him to important stations. He accompanied Count d'Aranda on his embassy to France, in the capacity of secretary. Charles III. created him count, and appointed him intendant of Seville. Olavides formed several great and useful plans of public improvement, particularly one for bringing the Morena into cultivation. Charges of heresy interrupted these projects, and the man who had done so much to promote the splendour and prosperity of his country, was condemned to imprisonment and monastic penances by the inquisition in 1778. In the third year of his confinement he succeeded, by the aid of his friends, in escaping to Venice, whence he afterwards returned to Spain, and died in 1803. A defence of religion against infidelity, "El Evangelio en Triunfo," which in two years passed through eight editions, is attributed to Olavides.

OLBERS, HENRY WILLIAM MATTHEW, a German author, who was born at Arbergen, in the duchy of Bremen, in 1758. In 1772, while at work at Bremen, he manifested a passion for astronomy, and in 1777 he went to the university of Göttingen, where he directed his attention particularly to comets. We are indebted to him for a new and convenient method of calculating the path of a comet. He acquired still greater reputation by his second discovery of Ceres in 1802, his discovery of the planet Pallas in the same year, and of Vesta in 1807. He wrote ten several treatises upon the calculation of the parallax of heavenly bodies, and upon meteoric stones. His inaugural discourse was "De Oculi Mutationibus Internis."

OLDCASTLE, SIR JOHN, LORD COBHAM. This nobleman was born in the fourteenth century, in the reign of Edward III., and obtained his peerage by marrying the daughter of Lord Cobham. He excited the resentment of the clergy by his zealous adherence to the doctrines of Wickliffe, whose works he collected and transcribed, distributing them among the people. In the reign of Henry IV. he was at the head of an English army in France, during the Orleans and Burgundian factions, and he obliged the duke of Orleans to raise the siege of Paris. Under Henry V. he was accused of heresy; but the king, with whom he was a favourite, delayed the prosecutions against him, and tried to reason with him and to convince him of his alleged errors, but in vain; and he soon after left him to his fate. He was then cited before the archbishop of Canterbury, and not being able to satisfy his accusers, he was condemned as a heretic and committed to the Tower, whence he escaped into Wales. A report was then zealously circulated by the clergy and sent to the king, that 20,000 Lollards were assembled at St. Giles's for his destruction, with Lord Cobham at their head. This accusation seems to have been fully credited by Henry, though there does not appear to have been really the slightest foundation for it; on which a bill of attainder was passed against Lord Cobham, and he was burnt alive.

in St. Giles's Fields in 1417. He was a man of high spirit and warm temper, which his misfortunes could not subdue. His acquirements were extensive, and his thirst after knowledge first made him acquainted with the doctrines of Wickliffe. In conversation he was remarkable for the poignancy and readiness of his wit. He wrote "Twelve Conclusions, addressed to the Parliament of England," published in Bale's "Breve Chronycle concerning the Examynacyon and Death of the blessed Martyr of Christ, Syr Johan Oldenastle, the Lorde Cobham."

OLDFIELD, ANN, a celebrated English actress, who was born at Westminster in 1683. Her father held a commission in the guards, but dying while she was young, she was apprenticed to a seamstress. Her talents attracted the notice of Farquhar, the author of "The Beaux' Stratagem," who introduced her to Sir John Vanbrugh, through whose means she obtained a theatrical engagement in 1699. She first distinguished herself in the character of Alinda, in "The Pilgrim" of Beaumont and Fletcher; but it was not till 1703, when she appeared as Leonora, in "Sir Courtly Nice," that her merits were properly appreciated; and having the advantages of a good figure and a fine voice, she soon became a general favourite. Her great excellence lay in comedy, and the parts of Lady Betty Modish in "The Careless Husband," and Lady Townly, in "The Provoked Husband," of Cibber, were those in which she was most admired; but she sometimes also appeared in tragedy; and in such characters as Calista and Cleopatra her talents were very conspicuous. Her death took place in 1730, and she was buried in Westminster Abbey.

OLDHAM, JOHN, an English poet, who was born in 1653 at Shipton, in Gloucestershire, and educated at Edmund Hall, Oxford. His talents as a poet procured him the notice of several persons of distinction, and he was taken into the family of the earl of Kingston, where he died, in the thirtieth year of his age, of the small-pox. His principal work is his "Four Satires on the Jesuits."

OLDISWORTH, a miscellaneous writer, who lived in the reigns of Queen Anne and George I., but little is known of his life. The titles of his principal works are, "A Translation of the Odes, Epodes, and Carmen Seculare" of Horace. He also translated "The Accomplished Senator," and was one of the original authors of "The Examiner." His death took place in 1734.

OLIVER OF MALMESBURY, an ecclesiastic of the eleventh century, who was distinguished for his great skill in mechanics. Among his many contrivances was one which did not reflect much credit on his judgment, though there is but little doubt that considerable talent was brought into the field. He is said to have attached wings to his hands and feet, and to have taken his flight from a lofty tower. Owing, however, to his own fears, or the violence of the wind, he fell to the ground and broke both his legs. There is but little doubt that Oliver had discovered the principle of the parachute, and, as such, that he was the first Englishman who attempted to travel through the aerial regions.

OLIVER, ANDREW, an American officer, who was for many years lieutenant-governor of Massachusetts. He was a representative of Boston at the general court, and one of his majesty's council. He was appointed secretary of the province at the death of the venerable Willard, and held the office until

1771, when he succeeded Mr. Hutchinson as lieutenant-governor. When the stamp act passed the parliament he was made distributor, which would have been a lucrative office, but he was obliged to resign it by the multitude, who injured his house in the riot that the act occasioned. His political principles, and fondness for wealth and power, induced him to pursue a public course similar to that of his brother-in-law, Mr. Hutchinson, under whose influence he was supposed to have been. He endeavoured to promote the designs of the British ministry, as was plainly proved by his letters, which Dr. Franklin obtained possession of in England, and sent over to America. In the same petition, accordingly, which the general court presented to the king for the removal of Governor Hutchinson, they begged that he also might be dismissed. He was then in very ill health, and died on the 3rd of March, 1774. His abilities were solid rather than brilliant; his learning was considerable, and his industry indefatigable. In private life he maintained a highly respectable character, and, had his public conduct been patriotic, he would have been an object of universal regard. He wrote well upon theological and political subjects, and some of his productions still remain.

OLIVER, PETER, an American gentleman, who was the younger son of the honourable Daniel Oliver, one of the first merchants of Boston. In 1730 he took his bachelor's degree, at Harvard university, and, after being employed in several offices in the county of Plymouth, which he filled with much credit, he was raised to the supreme bench. His appointment was at first very popular, but he became an object of general odium when it was known that he had accepted the post after an alteration had been made in the manner of paying the salaries of the judges, which were to be fixed, and to be entirely independent on the legislature of the province—a circumstance which had induced his predecessor, Judge Lynde, to resign. Mr. Oliver was impeached, in consequence, by the house of representatives. His prejudices against the revolutionary contest were strong; and when the British troops abandoned Boston, he accompanied them with other loyalists. He came to England, where he lived for some years on his salary, or a pension from the crown. The university of Oxford conferred on him the honorary title of LL. D. His talents as a writer, both of prose and poetry, were considerable. He was a contributor (as was his brother also) to "The Censor," a paper patronised by the Tories, and devoted to their interests. On leaving America he carried away various records and documents relating to the settlement of the country, which he had collected in the true spirit of an "old colony man." Such was his zeal in that respect, that he even transcribed, with his own hand, all the manuscript history of William Hubbard—a labour which must have been at least as irksome as the seven transcripts, made by Demosthenes, of the work of Thucydides.

OLIVIER, GUILLAUME ANTOINE, an eminent French naturalist and traveller, who was born near Frejus in 1756, and studied at Montpellier, where he received the degree of M. D. at the age of seventeen. Natural history, and especially botany and entomology, were his favourite pursuits, and at the age of twenty-three he went to Paris to assist in the composition of a work relative to the natural history of the district in which that metropolis is situated. He was

afterwards sent into England and Holland to collect materials for a general history of insects, and was also employed on the entomological part of "The Encyclopédie Méthodique." The revolution having arrested the progress of both these enterprises, Olivier travelled to Persia, together with M. Bruguières, another man of science, on a diplomatic mission planned by the minister Roland, whose death deprived the envoys of the financial resources and official protection on which they had calculated. Olivier returned to Paris in December 1798, after an absence of six years, during which he visited Egypt, Greece, Turkey, Arabia, Persia, and other eastern countries. He brought home numerous and valuable collections of curious objects of natural history, of which he published an account in his "*Voyage dans l'Empire Ottoman, l'Egypte, et la Perse.*" He died at Lyons in 1814.

**OLYMPIAS.**—This celebrated female was a daughter of Neoptolemus, king of Epirus, and married Philip, king of Macedonia, by whom she had Alexander the Great. Her haughtiness, and, more probably, her infidelity, led Philip to repudiate her, and to marry Cleopatra, the niece of King Attalus. The murder of Philip, which soon followed this disgrace, some have attributed to the intrigues of Olympias. Alexander treated her with respect, but did not allow her to take part in the government. Antipater succeeded Alexander in the government of Macedonia, and, on his own death, left the administration of the country to Polysperchon, who, to confirm his power, recalled Olympias from Epirus, whither she had fled, and confided to her the guardianship of the young son of Alexander. She now cruelly put to death Aridæus, son of Philip, with his wife Eurydice, as also Nicanor, the brother of Cassander, with one hundred leading men of Macedon, who were inimical to her interest. Such barbarities did not long remain unpunished. Cassander, son of Antipater, besieged her in Pydna, where she had retired with the remains of her family. She was obliged to surrender after an obstinate siege, and was put to death.

**OMAI.**—This celebrated native of the Friendly Islands acted as interpreter to Captain Cook in his third voyage round the world. His natural quickness and fidelity rendered him of considerable use to our great navigator in his intercourse with the natives of the South Seas. Omai was brought by Cook to England, where he was treated with much kindness and introduced into the best society. The ease and even elegance of his manners was an object of surprise; but almost all the uncivilized people of that part of the world, and more especially the New Zealanders, have exhibited the same natural respect for the opinions and feelings of others, which is the foundation of real politeness. Dr. Johnson speaks of Omai as showing the deportment of a well-bred gentleman. Omai was not a person of consequence, that is a chief in his own country, where the distinctions of rank are all-important.

When Captain Cook, whom he had so long accompanied, left him, during his last voyage, at Huaheine, with every provision for his comfort, he earnestly begged to return to England. It was nothing that a grant of land was made to him at the interposition of his English friends; that a house was built and a garden planted for his use. He wept bitter tears, for he was naturally afraid that his new riches would make him an object of hatred to his countrymen. He

took back many valuable possessions and some knowledge. But he was originally one of the common people; and he soon saw, although he was not sensible of it at first, that without rank he could obtain no authority. He forgot this when he was away from the people with whom he was to end his days; but he seemed to feel that he should be insecure when his protector Cook had left their shores. He divided his presents with the chiefs; and the great navigator threatened them with his vengeance if Omai was molested. The reluctance of this man to return to his original condition was principally derived from these considerations, which were to him of a strictly personal nature.

Cowper, the poet, has thus beautifully apostrophized Omai:—

"Thee, gentle savage! whom no love of thee  
Or thine, but curiosity perhaps,  
Or else vain glory, prompted us to draw  
Forth from thy native bow'rs, to show thee here  
With what superior skill we can abuse  
The gifts of Providence, and squander life.  
The dream is past; and thou hast found again  
Thy cocoas and bananas, palms and yams,  
And homestead thatch'd with leaves. But hast thou found  
Their former charms? And, having seen our state,  
Our palaces, our ladies, and our pomp  
Of equipage, our gardens, and our sports,  
And heard our music: are thy simple friends,  
Thy simple fare, and all thy plain delights,  
As dear to thee as once? And have thy joys  
Lost nothing by comparison with ours?"

I cannot think thee yet so dull of heart  
And spiritless, as never to regret  
Sweets tasted here, and left as soon as known.  
Methinks I see thee straying on the beach,  
And asking of the surge, that bathes thy foot,  
If ever it has wash'd our distant shore.  
I see thee weep, and thine are honest tears,  
A patriot's for his country: thou art sad  
At thought of her forlorn and abject state,  
From which no power of thine can raise her up."

**OMAR**, a celebrated caliph of the Saracens, under whose reign the empire of the Moslems was considerably extended. His generals fought with bravery, and were almost universally successful, and the caliph himself took the city of Jerusalem, which remained in the hands of the infidels till it was re-conquered by Godfrey of Bouillon at the end of the ele-

venth century. Besides his many conquests, Omar became celebrated for the attention which he paid to the Koran. It was under his direction that it assumed

its present form, as he collected and arranged the whole, which had previously been dispersed among the disciples of Mahomet. Omar was murdered in the tenth year of his reign, and the tomb in which his body was deposited is depicted in the previous page.

OPIE, JOHN, a celebrated English artist, who was born in 1761 in Cornwall. His father was a carpenter, and he was intended for the same occupation; but when very young he manifested a taste for study and a strong predilection for the arts of design. When about nineteen he removed to London, but his pictures were not admitted into the exhibition at Somerset House till 1786. He afterwards became an academician. He published "An Inquiry into the Cultivation of the Arts of Design in England," and delivered lectures at the royal institution. In 1804 he succeeded Fuseli as professor of painting, and read four lectures on painting, which have been published, and died in 1807.

OPITZ, VON BOBERFIELD, a talented German poet, who was born in Silesia in 1597. He began his career as an author by the publication of a collection of Latin poems, entitled "Strenarum Libellus," in 1616. The following year he became a teacher at the gymnasium of Benthem on the Oder, and, besides poetical compositions, he published his "Aristarchus, sive de Contemptu Linguae Teutonice." He then studied at Frankfort on the Oder, and, having afterwards visited many cities in Germany and Holland, he went in 1621 to the court of the duke of Liegnitz; whence in about a year he removed to become professor of philosophy and classical literature at the university of Weissenburg, then newly founded by Bethlem Gabor. The situation proving unpleasant, he soon returned to Bunzlau, and afterwards to Liegnitz. Becoming distinguished for his talents, he went to Vienna, where the emperor Ferdinand II. bestowed on him the poetical crown, and afterwards gave him letters of nobility, when he assumed the title of Von Boberfeld. He returned to Silesia and became secretary to the burgrave of Dohna; but on losing his patron by death, he entered anew into the service of the duke of Liegnitz. At length he was appointed secretary and historiographer to the king of Poland, and passed the last five years of his life at Dantzic, where he died in 1639. Among his works are, a poem on mount Vesuvius, "Silvæ," epigrams, &c. Opitz was the creator of a new and more correct poetical style in Germany, founded on the model of the ancient classics, and of a form of versification accommodated to rules of prosody, and resting on the measure of syllables and not their number. He was well acquainted with the ancients, and had stored his mind with useful knowledge, so that his poems, especially the larger ones, are rich in thought and invention. The language is indebted to him for new connexions and forms, greater smoothness and correctness, expressiveness and euphony.

ORIGEN, a learned ecclesiastical writer, who from his untiring diligence was surnamed Adamantius. He was born at Alexandria, A. D. 185, and early instructed by his father in the Christian religion and the sciences. His teachers afterwards were Clement of Alexandria and Ammonius. When his father was thrown into prison on account of his religion, under the emperor Severus, Origen exhorted him to suffer martyrdom rather than renounce Christianity. After the death of his father he maintained his mother and sister by giving instructions in grammar. At the

age of eighteen he was appointed to instruct the believers in Alexandria. Males and females crowded to his lectures. After the death of Septimus Severus in 211, Origen went to Rome, where he gained many friends and admirers. After his return, agreeably to the desire of Bishop Demetrius, he continued his instructions at Alexandria. A popular tumult compelled him to flee to Palestine. He was so highly esteemed by the bishops there that they permitted him to preach in their assemblies. His own bishop, moved with jealousy, recalled him. He was soon after invited to Achaia, which was distracted by various heresies; and on his way to Cæsarea, in Palestine, he was consecrated to the office of presbyter by the bishops who were then assembled. This laid the foundation for the persecutions which embittered the remainder of his life. Demetrius maintained that it belonged only to himself to consecrate Origen. He summoned two councils, and deprived Origen of his priestly offices, prohibited him from teaching in Alexandria, whither he had returned, compelled him to leave the city, and excommunicated him. This sentence was confirmed at Rome and by most of the other bishops. But the churches of Palestine, Arabia, Phœnicia, and Achaia, maintained a connexion with Origen, who denied the errors of which he was accused, and went back again to Cæsarea. Theochristus, the bishop there, received him as his teacher, and entrusted to him the duty of explaining the Holy Scriptures.

In the year 231 his persecutor died, and Origen now enjoyed in tranquillity his well-deserved fame. Gregory Thaumaturgus and his brother Athenodorus employed him as their instructor; but the persecution of the Christians under Maximin forced him to remain for two years in concealment. When peace was restored to the church by Gordian in 237, Origen took advantage of it to travel to Athens. He then went to Arabia, to which the bishops of this province had invited him, to refute Bishop Beryllus, who affirmed that the divine nature of Christ did not exist before his human nature. Origen spoke with such eloquence that Beryllus recanted, and thanked him for his instructions. The same bishops called him to a council which they held against certain heretics who maintained that death was common to soul and body. Origen spoke on this subject likewise with such power that he gained them all over to his own opinions. In a new persecution under the emperor Decius, Origen was viewed as a pillar of the church, was thrown into prison, and subjected to the most cruel sufferings. Exhausted by this severity, he died at Tyre in the year 254. Few authors have written so much: few men have been so much esteemed and admired, and yet attacked with such virulence, and persecuted with such severity, both during his life and after his death. He was reproached with having attempted to blend the Christian doctrines with the notions of Plato; particularly in his book "De Principiis," directed against heretics, and now extant only in the fragments of a translation by Rufinus, he presents a system founded on the Platonic philosophy; but he gives his opinions only as a possibility; moreover, the heretics of his own time, as he says himself, corrupted his writings. He has been accused, without reason, of favouring materialism. He expressly opposes those who consider God as having a corporeal nature. Of his works, with the exception of the one just mentioned,

there are extant only his "Exhortation to Martyrdom," commentaries, homilies, and scholia on the Holy Scriptures, of which he may have intended to explain the whole. We still have a large number of them, but they are in general nothing more than free translations. He made a general application of the figurative or allegorical explanations of the Jews, and rejected the literal meaning, which he regarded as the mere external part of the former. Besides these exegetical works, he distinguished himself by his critical talent in his "Hexapla," of which an edition was published by Montfaucon, and afterwards by Christopher Bahrdt. His work against Celsus is considered as the most complete and convincing defence of Christianity which antiquity can boast. His works, complete in four volumes folio, were published by De la Rue. There has been much contention about the orthodoxy of Origen. In the fourth century, the Arians appealed to his authority to confirm the truth of their doctrines. The most learned and the most celebrated fathers have been found both amongst his friends and opponents.

**ORLEANS.**—Two houses of this name have occupied the throne of France. The first—on the death of Charles VIII., without issue, in 1498, Louis, duke of Orleans, great grandson of their common ancestor Charles V., and grandson of the first duke of Orleans, being the nearest heir, ascended the throne under the title of Louis XII. Henry III. was the last sovereign of this house, or the Valois-Orleans branch. The second—the reigning house, or that of Bourbon-Orleans, is descended from Philip, duke of Orleans, son of Louis XIII., and younger brother of Louis XIV. His son, Philip II., duke of Orleans, was regent of France during the minority of Louis XV. His grandson, Louis Joseph Philip, who distinguished himself during the French revolution of the eighteenth century, married Louisa, daughter of the duke of Penthièvre, son of the count of Toulouse, a natural son of Louis XIV., and was beheaded in 1793. His only surviving son is Louis Philip I., king of the French.

**ORLEANS, GASTON JEAN BAPTISTE DE, FRANCE, DUKE OF**, third son of Henry IV. and Mary of Medici, born 1608, was involved, without glory, and without success, in all the troubles that agitated the reign of Louis XIII. and the minority of Louis XIV., four times quitted the kingdom, and four times returned with arms in his hands. His early education was miserable, and was the cause of the feebleness of character which he displayed through life, although he had received from nature much more of his father's spirit than Louis XIII. The jealousy which the latter, particularly before his wife, Ann of Austria, had borne him children, entertained of his brother, was the first cause of that difference between them which the duke's vindictive temper never allowed to be permanently healed. By his first marriage with Mary of Bourbon, heiress of the house of Montpensier, he had a daughter, the author of some interesting memoirs. To divert the duke from a second marriage, which the jealous king feared, and which even Richelieu esteemed hazardous, no efforts were spared to gratify his passion for play and for the arts. He continued this life of dissipation until, in the dispute between the queen mother and Cardinal Richelieu, he took part against the court. This dispute resulted in the triumph of the cardinal. The duke of Orleans was also obliged to submit, and in his political conduct and life now displayed that

singular vacillation which led the cardinal de Retz to say of him that he engaged in every thing because he wanted firmness to refuse those who led him, and that he always came off with disgrace because he wanted courage to persevere. When the duke, who at one moment, full of defiance, took arms against the court, and united himself with the enemies of his brother, and at another, full of humility, submitted to the king and the cardinal, sued for the hand of Mary, daughter of the duke of Lorraine, new disputes broke out between him and the king. The marriage was secretly concluded, and was not made known until two years afterwards to the king, who, by a decree of the parliament of Paris, had it declared null. This decision gave rise to a war of pens between the jurists and the theologians. The duke continued to take a part in all the troubles, and the validity of his marriage was not acknowledged until after the death of Louis XIII. During the disturbances of the Fronde the vacillating enemy of Richelieu could not be a steady friend of Mazarin. He joined his coadjutor De Retz, the soul of the Fronde, who soon saw through the character of his fickle and feeble confederate. After the termination of the troubles the duke was banished to Blois, where he died in 1660.

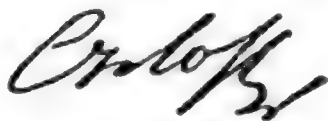

**ORLEANS, PETER JOSEPH**, a French Jesuit, who was the author of a work entitled "*Histoire des Revolutions d'Angleterre*." He was born at Bourges in 1641, and after having taught the belles lettres in his society, devoted himself to the writing of history. This object he pursued till his death, which took place in 1693. In addition to the work we have already mentioned, he wrote "*A History of the Revolutions of Spain*," "*A History of Two Conquering Tartars, Chunchi and Camhi*," "*The Life of Father Coton*," &c. His "*History of the Revolutions in England under the Family of the Stuarts, from the year 1603 to 1690*," was translated into English, to which is prefixed an "*Introduction by Laurence Echard, M. A.*" Echard says that "the great varieties and wonderful changes in these reigns are here judiciously comprised in a moderate volume with no less perspicuity than strictness, and with a beautiful mixture of short characters, nice reflections, and noble sentences, which render the whole agreeable and instructive. But while the reader is entertained with so much skill and fineness, we ought to caution him with relation to the education and religion of the author; for, though he has great marks of a generous candour, and a laudable deference to all superiors, yet he is to be considered in all places as one in favour with the French king, and not only a true papist, but a complete Jesuit."

**ORLOFF, COUNT GREGORY**, a Russian author, who was born in 1778, and was not only a writer himself, but also a great patron of literature in others. His first work was entitled "*Memoires Historiques, Politiques, et Litteraires, sur le Royaume de Naples*," which was followed by his "*Histoire des Arts en Italie*." He also translated the works of others into the Russian language. His death took place in 1826.

**ORLOFF, GREGORY**, a celebrated Russian officer, who became the favourite of Catherine II. He had a principal share in the revolution which placed that princess on the throne, and was richly rewarded by the empress. Orloff wished to become the husband of Catherine, but failed in his object, and was finally ordered to travel, accompanied, however, with a princely train. After spending some years abroad,

he returned, and died at Moscow in 1782. Some time previous to his death he became insane. His brother, Alexis Orloff, is said to have been the murderer of Peter, the husband of Catherine.

ORME, ROBERT, a learned historian, who was born in the East Indies, but brought to this country to receive the benefit of an English education. Having completed his studies, he returned to Calcutta, and obtained several appointments, when ill health compelled him again to return to Europe. Mr. Orme's death took place in 1801. His principal works are, "A History of the Military Transactions of the British Nation in Hindostan," and his "Historical Fragments of the Mogul Empire of the Mahrattas."

ORTON, JOB, an eminent nonconformist divine, who was born at Shrewsbury in 1717. Having received a good education, he turned his attention to theology, and became distinguished both as a preacher and writer. Among his publications are his "Memoirs of Dr. Doddridge," his "Discourses on Eternity," and his "Exposition of the Old Testament." Dr. Orton died in 1788.

OSBORNE, FRANCIS, an English writer, who was born about 1588. He was descended from an ancient family, who resided at Chicksand, near Shefford, in Bedfordshire. He went early in life into the service of the Pembroke family, and became a master of the horse to William earl of Pembroke. Upon the breaking out of the civil wars he took part with the parliament, and had public employments conferred upon him by them, as also by Cromwell afterwards; and having married a sister of one of Oliver's colonels, he procured his son a fellowship in All Souls college, Oxford, by the favour of the parliamentary visitors of that university in 1648. After this he resided there himself, and published there his "Advice to a Son," the first part in 1656, which went through five editions within two years; he therefore added a second in 1658. Though this was not liked so well as the first, yet both were eagerly bought and admired at Oxford. An order was afterwards obtained, forbidding all booksellers, or any other persons, to sell them: which, however, as is generally the case, made them sell the better. But the author did not long survive this order, being arrested by death on the 11th of February, 1658.

OSIANDER, FREDERIC BENJAMIN, one of the most distinguished German professors of midwifery. He was born in 1759 at Zell, in the kingdom of Würtemberg, and in 1792 was appointed professor of midwifery in the university of Gottingen, and director of the lying-in hospital, which was established in 1751, and had become the first school of midwifery in Germany. Osiander remained its director for thirty years, during which time about 3000 scholars enjoyed his instructions there. From eighty to 100 women were received there annually, and it often happened that several years passed without the occurrence of a single death. He published the history of this interesting institution, and a description of all the remarkable cases which occurred from 1794. He died in 1822. Osiander's numerous works, on almost every branch of medicine, are enumerated in Saalfeld's "History of the University of Gottingen from

1788." Among these is a "Manual of Midwifery," 1796; and "Manual of Accouchement," with a collection of drawings; "On the Diseases which take place in the Period of Development of the Female Sex."

OSTADE, ADRIAN VAN, a Dutch painter of eminence, who was born at Lubeck in 1610. The reputation which Teniers then enjoyed led Ostade to wish to imitate his style; but he was deterred from the execution of this project by the advice of Brauwer, another Flemish painter, who convinced him that he could never attain a high place in his art if he devoted himself to the servile imitation of another, however eminent. Van Ostade followed this advice, as well as the bent of his own mind; for while the subjects of which he made choice were of the same class with those of Teniers, he treated them in a manner altogether his own. Characteristic traits, some of which strike us at the first glance, distinguish Ostade and Teniers. These two masters are equally admirable for the transparency and harmony of their works; but the colouring of Teniers is clear, gay, and silvery, and his touch firm, light, and bold, while the pencil of Ostade, always rich and soft, is sometimes wanting in firmness. If we consider design and composition, Teniers places in opposition and unites with skill numerous groups; bold and able in giving all the effects of light, he develops extensive scenes in the open air, and gives them the spirit and life of nature, without any of his shadows being ever extravagant, and without even suffering the art of his combinations to be apparent. His figures are always correctly drawn; their attitudes easy, and even graceful. Ostade, on the contrary, collects his figures into places feebly lighted,—generally in the interior of houses, where a partial gleam only breaks through the masses of foliage which shade the window. He does not always observe the laws of perspective with rigorous accuracy, and the drawing of his figures is often incorrect; but he charms principally by the spirit with which he animates his groups, by a general softness of composition, and by his mysterious and striking effects of light. But a difference, still more important, distinguishes the works of these two masters. Teniers, while he imitates nature, preserves her grace. If he represents rustic festivals, we recognise in the sports of the peasants, in their joy, in their anger, the diversity of their characters. Every condition and every age has its peculiar manners. Ostade attaches himself constantly to the representation of humorous scenes. Confining the circle of models, he contents himself with choosing from the figure and the actions of peasants, whatever nature offers of grotesque and of low. He varies his subjects with skill, as well as the expression of his faces; but he never deviates from the burlesque style which he has chosen. Teniers paints the manners of the Dutch peasantry as they were marked by occasional grossness, but with a general character of hearty jollity and of mirth proceeding from content. Ostade, a satirist, deforms his personages to render them more droll and ridiculous. The director of Ostade's taste, Brauwer, painted in alehouses the companions of his debauchery; Ostade, on the contrary, as well as Teniers, was remarkable for the decency and the gravity of his manners. On the approach of the French troops in 1662, Ostade went to Amsterdam, where he resided till his death, which took place in 1685.

OSWALD, JOHN, a Scottish writer, who early in life displayed a strong predilection for literature. He served for some years in the British army in India, where he was distinguished by his eccentric conduct. On the breaking out of the French revolution he went to France, and obtained the rank of colonel in the French army. He fell in the field of battle. His works are almost all of a burlesque character; among them we may mention his "*Ranæ Comicæ Evangelizantes*; or the Comical Frogs termed Methodists."

OTFRID, or OTFRIED, the author of one of the earliest specimens of composition in the German language. He was a native of Suabia, and lived in the middle of the ninth century. After having become a monk of the abbey of Weissenburg, in Alsace, he studied under Rabanus Maurus, abbot of Fulda. He then returned to his monastery, where he opened a school of literature, and wrote a variety of works in prose and verse. The most important of these is a rhymed version, or paraphrase, of the gospels, in old High German, still extant, in which there are some passages of lyrical poetry.

OTHO, MARCUS SALVIUS, a Roman emperor, who was successor of Galba. He was descended from a consular family, and passed his youth in luxury and debauch, being the confidant of Nero. This emperor appointed him proconsul in Lusitania, that he might remove an obstacle to the gratification of his passion for Poppæa Sabina, the wife of Otho, to whose beauty her husband himself had first called his attention. Otho held his place with honour for ten years. He was the first to declare for Galba when he rebelled against Nero, and accompanied him to Rome, where he was made consul immediately after Galba ascended the throne, A. D. 67. As Galba did not adopt him for his successor, and as he was greatly distressed, having squandered away all his fortune, he determined to effect the fall of the emperor. He succeeded with the assistance of the pretorian bands and the other troops. Galba was murdered and Otho proclaimed emperor; but the legions in Germany proclaimed Vitellius. In vain did Otho offer immense sums to gain them to his side. Vitellius refused the offer to reign as joint emperor, and led his army over the Alps. Otho, for whom most of the provinces had declared, sent against these veteran troops an army of newly levied soldiers, but commanded by able generals, who defeated in three battles the divided army of Vitellius. Elated by his success, and becoming imprudent, Otho determined on a decisive battle against the now united troops of his adversary, and was beaten. Upon receiving information of his misfortune he resolved, by a voluntary death, to end the civil war, and pierced himself with his dagger, after reigning three months and three days. Notwithstanding his luxurious habits he had given proofs of a daring and resolute spirit.

OTHO I.—This early German emperor was born in 912. His haughtiness and selfish spirit excited the enmity of his brothers, and even his mother was so much disgusted at them as to employ all her influence against him in favour of her second son, Henry. Otho's firmness, however, prevailed; and he was crowned king of Germany, at Aix-la-Chapelle, in 936; Wenceslaus, on whom he had conferred the duchy of Bohemia, having been murdered by his brother, the latter, on Otho's refusal to acknowledge his claim to the succession, determined to make Bohemia independent of Germany, and was not reduced until 950,

after a fourteen years' war. Otho also brought to a successful issue the struggles with the dukes of Bavaria and Franconia, and invested his son Ludolf with the duchy of Suabia, and his brother Henry with that of Bavaria. Conrad, count of Worms, married Otho's daughter, and received Lorraine. Otho likewise gained reputation in his dealings with foreign states. The Danes, who had invaded Germany, were driven back beyond the Eider; the Danish king was obliged to embrace Christianity, and acknowledge himself a vassal of the empire. Louis called in his aid against the great vassals under the powerful Hugh the Great. Otho reduced the rebels to terms, and confirmed the authority of the king.

The Italians next required his assistance to deliver them from the oppressions of Berengarius II. Otho defeated the usurper, married the widow of the last king, and was crowned king of Lombardy at Pavia in 951. This marriage not only engaged him in ambitious attempts for the possession of Italy, but attracted many foreigners to his court, and involved him in family dissensions. His son Ludolf and his son-in-law Conrad, duke of Lorraine, revolted, but were worsted and deprived of their duchies in 954, which were placed under Bruno, archbishop of Cologne, brother of Otho. Hardly were these transactions completed when the Hungarians broke into Germany, but were defeated by Otho on the Lechfeld, near Augsburg, with such slaughter that they never ventured to renew their invasions. Otho next turned his arms against Berengarius, who had revolted. He was crowned king of Italy by the archbishop of Milan, and soon after emperor by the pope, John XII. The pope took the oath of allegiance to him, and the clergy promised that for the future the choice of pope should always be made in the presence of an imperial commissioner.

John soon repented of having given himself a master, and flew to arms while the emperor was yet in Pavia. The latter hastened to Rome, deposed that pontiff, and placed Leo VIII. in the papal chair. No sooner was Otho returned to Germany than the Romans restored John, and reversed the measures of the emperor, who again appeared in Rome and punished his enemies. The Byzantine court refused to acknowledge Otho's claim to the imperial dignity; but he defeated the Greek forces in Lower Italy, and the eastern emperor, John Zimisce, gave the Greek princess, Theophania, to his son in marriage. Otho died in 973, leaving the reputation of great courage and the strictest integrity. The clergy in Germany were indebted to him for their elevation, which he encouraged to counterbalance the power of the temporal vassals.

OTHO II., the youngest son of Otho I. and the fair Adelaide, was born in 955. His elder brothers had all died before their father, who caused him to be crowned king of Rome—the first instance of the kind in German history. He inherited from his father a hasty and unsteady temper, which, while it led him to form great projects, also pushed him forward too impatiently to their execution. Adelaide at first held the reins of government. Otho, disgusted at his state of dependence, left the court, and a civil war broke out, at the head of which was his cousin Henry, the young duke of Bavaria. Otho completely humbled him, and granted the duchy to his nephew Otho, of Suabia, who thus became the possessor of two great fiefs. He afterwards became involved in a war

with Lothaire, king of France, for Lorraine. Lothaire attacked him in Aix-la-Chapelle in 978, and Otho was obliged to retreat; but having collected his forces, drove back Lothaire, laid waste Champagne, and advanced towards Paris, the suburbs of which he burned. By the terms of the peace which was concluded in 980, Lorraine was left in its former relations to the empire. Otho next attempted to drive the Greeks from Italy, but they called in the Saracens to their aid from Sicily, and Otho suffered a total defeat at Basentello, in Calabria. He himself escaped only by leaping into the sea, where he was picked up by a Greek ship that was sailing by. From this he afterwards made his escape by artifice; but he died soon after at Rome, in 983. His son, Otho III., who succeeded him, was born in 980, and died in 1002. With him the male line of the imperial Saxon house became extinct.

OTIS, JAMES, a distinguished American patriot, who was born on the 5th of February, 1724, in the United States. The first two years of his collegiate course are said to have been given more to amusement than to study, his natural disposition being vivacious and ardent; but subsequently he was distinguished for his application and proficiency. After finishing his course at the university, he devoted eighteen months to the pursuit of various branches of literature, and then entered upon the study of the law. This he quickly mastered, and his practice became very extensive. On one occasion he went in the middle of winter to Halifax, in consequence of urgent solicitation to defend three men accused of piracy, and procured their acquittal. Although his professional engagements were so numerous, he cultivated his taste for literature, and in 1760 published a treatise entitled "The Rudiments of Latin Prosody, with a Dissertation on Letters and the Principles of Harmony, in Poetic and Prosaic Composition; collected from the Best Writers." He also composed a similar work on Greek prosody, which remained in manuscript and perished with all his papers. It was never printed, as he said, because "there were no Greek types in the country; or, if there were, no printer knew how to set them." In 1755 he married Miss Ruth Cunningham, the daughter of a respectable merchant, who brought him a dowry at that time considered very large. Amid all the embarrassments which his affairs subsequently experienced in consequence of his entire devotion to the concerns of the public, he sacredly preserved the fortune which he received with his wife, to whom it returned after his death.

The public career of Mr. Otis dates from the period when he made his famous speech against the "writs of assistance," for which an application had been made, by the officers of the customs, to the superior court of Massachusetts, in pursuance of an order in council, sent from England, to enable them to carry into effect the acts of parliament regulating the trade of the colonies. When that order arrived, Otis was advocate-general, and was, consequently, requested to lend his professional assistance in the matter; but, deeming the writs to be illegal and tyrannical, he refused, and resigned his station. He was then applied to, to argue against the writs, which he immediately undertook to do, in conjunction with Mr. Thacher, and in opposition to his former preceptor, Mr. Gridley, the attorney-general. Of the discourse which he pronounced, the president, Mr.

Adams, says, "Otis was a flame of fire: with a promptitude of classical allusions, a depth of research, a rapid summary of historical events and dates, a profusion of legal authorities, a prophetic glance of his eyes into futurity, and a rapid torrent of impetuous eloquence, he hurried away all before him. American independence was then and there born. Every man, of an immense crowded audience, appeared to me to go away as I did, ready to take arms against writs of assistance." The court adjourned for consideration, and, at the close of the term, the chief-justice, Hutchinson, delivered the opinion: "The court has considered the subject of writs of assistance, and can see no foundation for such a writ; but, as the practice in England is not known, it has been thought best to continue the question to the next term, that in the mean time opportunity may be given to know the result." When the next term came, however, nothing was said about the writs; and though it was generally understood that they were clandestinely granted by the court, and that the custom-house officers had them in their pockets, yet it is said that they were never produced or executed.

Otis had now fully committed himself against the designs of the British ministry, and thenceforward bent all his energies to maintain the freedom of his country. At the next election of members of the legislature, in May 1761, he was chosen, almost unanimously, a representative from Boston, and soon became the leader in the house of the popular party. In 1765 Mr. Otis was chosen, by the Massachusetts legislature, one of the members of a committee appointed to meet the committees of the legislatures of other colonies at New York, in consequence of the passing of the stamp-act by parliament. They met in convention in the same year, and named three committees to prepare addresses to the king, lords and commons. On the last Mr. Otis was placed. In this convention Mr. Otis made the acquaintance of many distinguished men from different colonies, and subsequently maintained, with several of them, a friendship and correspondence. In May 1767, after the repeal of the stamp-act, Mr. Otis was elected speaker of the house of representatives; but he was negatived by the governor, who entertained a peculiar animosity towards him, from his indefatigable endeavours to defeat every plan of encroachment. In the summer of 1769 the vehement temper of Mr. Otis was so much wrought upon by the calumnies which he discovered that the commissioners of the customs in Boston had transmitted to England concerning him,—by which, indeed, they sought to have him tried for treason,—that he inserted an advertisement in the "Boston Gazette," denouncing them in severe terms. The next evening he went to the British coffee-house, where one of the commissioners, a Mr. Robinson, was sitting with a number of officers of the army, navy, and revenue. As soon as he entered an altercation arose, which was quickly terminated by a blow from Robinson's cane. Otis immediately returned it with a weapon of the same kind, when the lights were extinguished, and he was obliged to defend himself, single-handed, against numbers. After some time the combatants were separated. Robinson retreated by a back passage, and Otis was led home, wounded and bleeding. He received a deep cut on his head; and to this has been partly attributed the derangement under which he afterwards laboured.

Soon after this transaction he instituted an action against Robinson, and obtained an award of 2000*l.* sterling damages, which, however, he gave up on receiving a written apology, in which the defendant acknowledged his fault and begged his pardon. In 1770 he retired into the country on account of his health. At the election in 1771 he was again chosen a representative; but this was the last year that he took a part in public concerns, except occasionally to appear at a town-meeting. He withdrew also, almost entirely, from the practice of his profession. His mind became seriously affected, and continued so, with some lucid intervals, until his death. Sometimes he was in a frenzied state, at others, he exhibited rather the eccentricity of a humourist than absolute derangement. The two last years of his life were passed at Andover. After he had been there for some time he was supposed to be completely restored, and returned to Boston. He resumed his professional engagements, and pleaded a cause in the court of common pleas, in which he displayed considerable power, but less than was his wont. The interval of reason was not however of long duration, and he was induced to go back to Andover. Six weeks after his return he was killed by a stroke of lightning, in the sixtieth year of his age. This event happened in May 1783. The chief defect of Mr. Otis's character was his irascibility. His merits are well summed up in the following extract from the work of Mr. Tudor, to which we have before alluded:—"In fine, he was a man of powerful genius and ardent temper, with wit and humour that never failed; as an orator, he was bold, argumentative, impetuous, and commanding, with an eloquence that made his own excitement irresistibly contagious; as a lawyer, his knowledge and ability placed him at the head of his profession; as a scholar, he was rich in acquisition, and governed by a classic taste; as a statesman and civilian, he was sound and just in his views; as a patriot he resisted all allurements that might weaken the cause of that country to which he devoted his life, and for which he sacrificed it." It is greatly to be regretted that, during his derangement, he destroyed all his papers; sufficient evidence, however, of his power as a writer remains in the various state papers of which he was the author whilst a member of the legislature, though they were subjected to the revising pen of Samuel Adams, whose patient temper permitted him to undergo the labour of correcting and polishing, which the ardour of the other disdained.

OTT, HENRY, a celebrated Swiss, who was born in 1617. In 1636 he was sent to study at Lausanne, and went some time after to Geneva and Groningen, in the company of Hottinger; and, having made great progress under the professors Gomar and Alting, he passed to Leyden and Amsterdam. Here he applied himself to rabbinical learning and the oriental languages for five years, at the end of which he made the tour of England and France. Soon after his arrival in Switzerland he was presented to the church of Dietlickon, of which he continued minister for twenty-five years. He was nominated professor of eloquence in 1651, of Hebrew in 1655, and of ecclesiastical history in 1668. He held a literary correspondence with several learned men till his death, which took place in 1682. He published several works, among which we may mention his "*Franco Gallia*," "*Oratio de Causa Jansenitica*," and "*The Grandeur of the Roman Church, with Remarks*."

OTWAY, THOMAS.—This talented but unfortunate dramatist was born at Trotting in Sussex, in March, 1651, and educated at Christ Church college, Oxford, where he entered a commoner in 1669. He, however, left the university without taking his degree, and came to London, where he immediately commenced writing for the theatres. He subsequently obtained a cornet's commission in a new-raised regiment destined for Flanders. He went there with the rest of the forces in 1677, but returned the following year in very indigent circumstances, so that he was obliged to have recourse to his pen again for a sustenance. He continued writing plays and poems till his death, which took place in April 1685, "in a manner," says Dr. Johnson, "which I am unwilling to mention. Having been compelled by his necessities to contract debts, and hunted, as is supposed, by the terriers of the law, he retired to a public-house on Tower Hill, where he died of want, or, as it is related by one of his biographers, by swallowing, after a long fast, a piece of bread which charity had supplied. He went out, as is reported, almost naked, in the rage of hunger, and finding a gentleman in a neighbouring coffee-house, asked him for a shilling. The gentleman gave him a guinea; and Otway going away bought a roll, and was choked with the first mouthful. All this, I hope, is not true; but that indigence and its concomitants, sorrow and despondency, brought him to the grave, has never been denied."

Dryden had some pique against him, probably on account of his friend Shadwell, and spoke frequently of him with contempt, but changed his tone at last, and declared in his favour. Langbaine, in speaking of him, says, "That his genius in comedy leaned a little too much to libertinism; but that in tragedy he made it his business for the most part to observe the decorum of the stage,—that he was a man of excellent parts, and daily improved in his writing, but yet sometimes fell into plagiarism, as well as his contemporaries, and made use of Shakspeare to the advantage of his purse at least, if not his reputation. It is universally agreed, that he excels in touching the tender passions in tragedy, of which his '*Orphan*' and '*Venice Preserved*' contain the strongest specimens." Mrs. Barry, the celebrated actress, used

to say that, in the part of Monimia in "The Orphan," she never spoke these three words, "Ah! poor Castalio!" without tears. These two tragedies are still acted, but he wrote many others. Besides these, Otway made some translations and wrote several miscellaneous poems. In 1719 appeared a drama ascribed to Otway, but certainly not written by him, called "Heroic Friendship, a Tragedy." At the time of his death, however, he had made some progress in a play, for the following advertisement, printed in *L'Estrange's "Observer,"* appeared on the 27th of November, 1686: "Whereas Mr. Thomas Otway, some time before his death, made four acts of a play; whoever can give notice in whose hands the copy lies, either to Mr. Thomas Betterton or to Mr. William Smith, at the theatre royal, shall be well rewarded for his pains."

OUGHTRED, WILLIAM, an English mathematician and divine, who was born at Eton in Buckinghamshire, in 1571, and received his education at Cambridge. He entered holy orders and obtained his degree of M. A. in 1599, after which he was presented to the rectory of Aldbury in Surrey, where he died in 1660. Among his many learned works we may enumerate his "Treatise on Trigonometry," "Key to the English Mathematics, New Forged and Filed," and his "Conic Sections," which appeared after his death, annexed to Sir James Moore's "Arithmetic."

OVERALL, JOHN, a learned English bishop, who was born in 1559, and was sent to St. John's college, Cambridge, but afterwards removed to Trinity college, where he was chosen fellow. In 1606 he was appointed regius professor of divinity, when he took the degree of D. D., and about the same time was elected master of Catherine Hall in the same university. In 1601 he was preferred to the deanery of St. Paul's, London, by the recommendation of his patron, Sir Fulk Greville, and Queen Elizabeth; and, in the beginning of James's reign, was chosen prolocutor of the lower house of convocation. In 1612 he was appointed one of the first governors of the Charter House hospital, then just founded by Thomas Sutton, Esq., and in April 1614 he was made bishop of Litchfield and Coventry, and in 1618 translated to Norwich, where he died in May 1619. This prelate had the character of being the best scholastic divine of his period; and Cosin, bishop of Durham, calls himself his scholar, and expressly declares that he derived all his knowledge from him. He is also celebrated by Smith for his distinguished wisdom, erudition, and piety. In the controversy, which in his time divided the reformed churches, respecting predestination and grace, he held a middle opinion, inclining rather to Arminianism, and seems to have paved the way for the reception of that doctrine in England, where it was generally embraced a few years afterwards, chiefly by the authority and influence of Archbishop Laud.

But Bishop Overall is principally celebrated by his "Convocation Book," respecting which the following account from Bishop Burnet will best describe it:—"This book," says that historian, "was wrote on the subject of government, the divine institution of which was very positively asserted. It was read in convocation, and passed by that body, in order to the publishing of it, in opposition to the principles laid down in the famous book of Parsons, the Jesuit, published under the name of 'Doleman.' But King James did not like a convocation entering into such a theory of po-

litics, so he discouraged the printing of it, especially since, in order to justify the owning of the United Provinces, who had lately thrown off the Spanish yoke, to be a lawful government, it was laid down that, when a change of government was brought to a thorough settlement, it was then to be owned and submitted to as a work of the providence of God. Here it slept till Archbishop Sancroft, who had got the book into his own hands, and not observing the last-mentioned passage in it, resolved to publish it in the beginning of King William's reign, as an authentic declaration the church of England had made in the point of non-resistance. Accordingly it was published in quarto, as well as licensed, by him a very few days before he was under suspension for not taking the oaths."

OVERBURY, SIR THOMAS, a miscellaneous writer, who is principally celebrated on account of his tragic death. He was born in 1581 in Warwickshire, and received his education at Queen's college, Oxford, after which he entered the Middle Temple to study the law. He, however, became acquainted with Robert Carr, the worthless favourite of James I., who procured him the honour of knighthood from the king, and a place for his father. Their intimacy continued to be beneficial to each other till Robert Carr engaged in his celebrated intimacy with the countess of Essex, and on his wishing to marry that lady, Overbury strongly opposed the measure. The countess immediately exercised her influence to obtain his removal, and an attempt was made to obtain his appointment to a distant mission, but he refused to accept it, and on the ground of disobedience to the king's wishes he was committed to the Tower, where he was murdered in September 1613. All the persons connected with the murder were tried and convicted; but, to the disgrace of James, he pardoned the earl and countess.

The following extract from his works will give the reader some idea of his powers as a writer. It is a representation of the character of a country girl, entitled "The Fair and Happy Milk Maid:"—

"She knows a fair look is but a dumb orator to commend virtue, therefore minds it not. All her excellencies stand in her so silently, as if they had stolen upon her without her knowledge. The lining of her apparel, which is herself, is far better than outsidings of tissue; for, though she be not arrayed in the spoil of the silk-worm, she is decked in innocence,—a far better wearing. She doth not, with lying long in bed, spoil both her complexion and conditions; nature hath taught her, too immoderate sleep is rust to the soul; she rises therefore with chanciere, her dame's cock, and at night makes the lamb her curfu. In milking a cow and straining her teats through her fingers, it seems that so sweet a milk-press makes the milk whiter or sweeter; for never came almond-glore or aromatic ointment on her palm to taint it. The golden ears of corn fall and kiss her feet when she reaps them, as if they wished to be bound and led prisoners by the same hand that felled them. Her breath is her own, which scents all the year long of June, like a new made hay-cock. She makes her hand hard with labour, and her heart soft with pity; and when winter evenings fall early, sitting at her merry wheel, she sings defiance to the giddy wheel of fortune. She doth all things with so sweet a grace, it seems ignorance will not suffer her to do ill, being her mind is to do well. She bestows her year's wages at next

fair, and in chusing her garments, counts no bravery in the world like decency. The garden and bee-hive are all her physic and surgery, and she lives the longer for it. She dares go alone and unfold sheep in the night, and fears no manner of ill, because she means none; yet, to say the truth, she is never alone, but is still accompanied with old songs, honest thoughts, and prayers, but short ones; yet they have their efficacy, in that they are not palled with ensuing idle cogitations. Lastly, her dreams are so chaste that she dare tell them; only on a Friday's dream is all her superstition; that she conceals for fear of anger. Thus lives she, and all her care is, she may die in the spring time, to have store of flowers stuck upon her winding sheet."

OVID, NASO PUBLIUS, an ancient Roman poet, who was born at Sulmo, near Rome. His father intended him for the profession of the Roman law, and therefore sent him early in life to the capital, where he studied eloquence under the most celebrated masters. Notwithstanding his great success, his father's expectations were soon frustrated. His son was born a poet; and though he was often reminded that even Homer lived and died in poverty, his ruling passion triumphed over all obstacles, and nothing could divert him from pursuing the bent of his inclinations. Every thing he wrote was poetical, and as Pope expresses it, "He lisp'd in numbers, for the numbers came." A lively genius and fertile fancy soon gained him friends and admirers among the most distinguished characters of his age. Virgil and Horace honoured him with their correspondence, and Augustus patronised him with the most unbounded liberality. At the death of his elder brother he came in possession of an easy independence, when he relinquished the bar for his favourite pursuit of poetry. Ovid now divided his time between Rome and his beautiful villa near the Appian Way, in the full enjoyment of social and literary pleasures, and in the bosom of domestic happiness with his wife Perilla, whose beauty and virtue he has so frequently celebrated. But this life of ease and indulgence was but of short duration, for he was banished by Augustus to Tomas on the Euxine Sea. This sudden exile was attributed to the indelicacy of some of his verses, which were considered as pernicious to the morals of the Roman youth. But it is supposed rather to have proceeded from political motives, and the accidental discovery that Ovid had made of the private vices of some of the imperial family. But whatever was the fault of Ovid, it was unpardonable in the eyes of Augustus, who continued inexorable to the most submissive importunities and flattering addresses of the poet. The pusillanimity that he betrayed in his banishment, and his gross adulation of the emperor, have subjected him to deserved ridicule and pity. Not content with lavishing the most extravagant praises on Augustus during his life, he literally made an idol of him after his death, and consecrated a chapel to his memory, on which he daily offered incense. Tiberius seemed to inherit the resentment of his predecessor, and was equally insensible to all the intreaties that were made for Ovid's return to Rome, and he died in the eighth year of his exile, in the fifty-ninth year of his age, A. D. 17.

The genius of Ovid was of a very varied nature, and adapted to all kinds of poetry. Though his writings are sometimes justly censured, they possess great sweetness and elegance, with much taste, and an accurate knowledge of the human heart. His most

celebrated works are his "Fasti," which were divided into twelve books, the same number as the constellations in the zodiac, six of which have perished. These are much valued for the descriptions they contain of the religious rites and festivals of the ancient Romans. His "Epistles," and "Art of Love," are written with great elegance and taste; but the latter unfortunately contains that pernicious doctrine which is calculated to corrupt the heart and sap the foundations of virtue and morality. But his finest performance, and on which he rested his hopes of immortality, was his "Metamorphoses," his last work before he was sent into banishment; this would have been lost to posterity if a few copies had not been taken; for, on receiving his sentence, he indignantly threw it into the fire. These productions have ranked him among the first poets among the ancients, and have been justly appreciated by the moderns. So highly were his talents esteemed by Alphonso, king of Naples, that being in the neighbourhood of Sulmo, the birth-place of Ovid, he saluted the town, and did homage to the genius of the country, which had produced so great a poet, adding, "that he would willingly resign part of his dominions to recall to life that man whose memory was dearer to him than the possession of Abruzzo."

OUDNEY, WALTER.—This gentleman formed one of the party who accompanied Captain Clapperton in his expedition through Africa. The result of this journey was most unfortunate, as nearly all the persons connected with it lost their lives. Captain Clapperton, in a letter dated the 2nd of February, 1824, thus describes the death of his fellow-traveller. He says, "The melancholy task has fallen to me to report to you the ever-to-be-lamented death of my friend Dr. Walter Oudney. We left Kuka on the 14th day of December, 1823, and by easy journeys arrived at Bedukarfea, the westernmost town in the kingdom of Bornou. During this part of the journey he was recovering strength very fast, but on leaving Bedukarfea and entering the Beder territory, on the night of the 26th and morning of the 27th, we had such an intense cold, that the water was frozen in the dishes, and the water-skins as hard as boards. Here the poor doctor got a severe cold, and continued to grow weaker every day. At this time he told me when he left Kuka, he expected his disorder would allow him to perform all his country expected from him, but that now his death was near, and he requested me to deliver his papers to Lord Bathurst, and to say he wished Mr. Barrow might have the arrangement of them, if agreeable to the wishes of his lordship.

"On the 2nd of January, 1824, we arrived at the city of Katagum, where we remained till the 10th, partly to see if the doctor, by staying a few days, would gain a little strength to pursue his journey. On leaving Katagum he rode a camel, as he was too weak to ride his horse. We proceeded on our road for ten miles that day, and then halted, and on the following day five miles further, to a town called Murmur. On the morning of the 12th he ordered the camels to be loaded at daylight, and drank a cup of coffee, and I assisted him to dress. When the camels were loaded, with the assistance of his servant and me, he came out of his tent. I saw then that the hand of death was upon him, and that he had not an hour to live. I begged him to return to his tent and lie down, which he did, and I sat

down beside him: he expired in about half an hour after. I sent immediately to the governor of the town, to acquaint him with what had happened, and to desire he would point out a spot where I might bury my friend, and also to have people to wash the body and dig the grave, which was speedily complied with. I had dead-clothes made from some turbans that were intended as presents; and as we travelled as Englishmen and servants of his majesty, I considered it my most indispensable duty to read the service of the dead over the grave, according to the rites of the church of England, which happily was not objected to; but, on the contrary, I was paid a good deal of respect for so doing. I then bought two sheep, which were killed and given to the poor; and I had a clay wall built round the grave to preserve it.

OWEN, JOHN, an epigrammatical writer, who was born in Caernarvonshire, and received his education at New college, Oxford. In 1594 he was appointed master of a school in Warwick, when he became celebrated for his Latin poems, but more especially for his epigrams. He experienced the poet's frequent lot of poverty, being supported in the latter part of his life by Bishop Williams, who, on his death, had him buried in St. Paul's cathedral.

OWEN, JOHN, D. D., an English nonconformist divine, who was born at Stadham in Oxfordshire, in 1616, of which place his father was vicar. He studied at Oxford, and remained at college until his twenty-first year. On the breaking out of the civil war he took part with the parliament, became a tutor in the family of Sir Robert Dormer, and chaplain to Lord Lovelace; but subsequently repaired to London, where he wrote his "Display of Arminianism," which was published in 1642. He had hitherto been a presbyterian in matters of church government, but now adopted the congregational or independent mode as more conformable to the New Testament, and published his reasons. During the siege of Colchester he became acquainted with General Fairfax, and having acquired great celebrity, was appointed to preach at Whitehall the day after the execution of Charles I. He was soon after introduced to Cromwell, whom he accompanied in his expeditions both to Ireland and Scotland; and in 1651 was made dean of Christ Church college, Oxford, and in 1652 was nominated by Cromwell, then chancellor of the university, his vice-chancellor. On the death of the protector he was deprived both of that and his deanery by the influence of the presbyterian party. At the meeting of his brethren at the Savoy in 1658, he took a great part in drawing up the confession of faith of the congregational churches. While the bill to revise the conventicle act was pending, he drew up reasons against it, which were laid before the lords. He died in 1683, in the sixty-third year of his age. Among his publications we may mention his "Exposition on the Epistle to the Hebrews," "A Discourse on the Holy Spirit," a complete collection of sermons, and several tracts, "An Inquiry into the Original Nature, Institution, &c., of Evangelical Churches," "An Account of the Nature of the Protestant Religion," &c.

OWEN, LEWIS, a controversial writer, who was born in Merionethshire in 1572. Early in life he went to Spain and entered the society of Jesuits, but finding that they did not meet his views in religion, he came back and employed the knowledge which

he had obtained to expose them in his work, "Speculum Jesuiticum, or the Jesuits' Looking-Glass."

OWEN, WILLIAM, an English artist of considerable talent, who was born in Shropshire in 1769. He was placed at a grammar-school in Ludlow, where his early love of painting attracted the notice of Mr. Payne Knight, who lived in the neighbourhood, and by his advice young Owen was sent to London and placed under the tuition of Charles Catton, the royal academician. Here he had the good fortune to attract the attention of Sir Joshua Reynolds, and having some time after made an exquisite copy of Sir Joshua's picture of Mrs. Robinson, in her celebrated character of Perdita, he had the advantage of the president's advice and instruction for the remainder of the life of that great master. In the year 1797 he exhibited at Somerset House a picture of the two Misses Leaf, by which he gained great credit, and in the latter part of the same year he married the elder of those ladies. In the year 1800 Mr. Owen settled with his family in Pimlico, but carried on his professional avocations at his rooms in Leicester Square, in the house next to that in which Sir Joshua Reynolds formerly lived. At this period he made great advances in his art, and was in constant intercourse with many persons of the highest rank and consequence in the country. One of the portraits of this artist was that of William Pitt, who took great notice of Mr. Owen and invited him to Walmer Castle. His whole-length portrait of the lord chancellor is also a characteristic likeness. The composition is exceedingly good, the colouring natural and harmonious, and the general effect admirable. Nor can any one, who was so fortunate as to see his portrait of the duchess of Buccleugh, easily forget the placid dignity of the figure, and the exquisite tone that pervades the whole canvass. Mr. Owen occasionally relieved the monotony of portrait-painting by employing his pencil on subjects of fancy; although even in works of that description he never failed to have recourse to nature as his model. Among the earliest specimens of his taste and skill in compositions of this kind are, the Blind Beggar of Bethnal Green, and the Village Schoolmistress, both of which have been the subjects of highly popular prints. The Road Side, painted for Mr. Lister Parker, and exhibited at the royal academy in 1807, also excited general admiration. In speaking of this beautiful picture a judicious critic observes, "Adherence to the simple elegance of untutored nature, unstudied ease and gracefulness of attitude, beauty of face and form, charm the heart of the spectator. The maternal tenderness with which the parent presents the nectarean repast to her child, the sound repose of the infant girl, the tranquil and amiable expression of the eldest boy, excite gentle and agreeable sympathy. The drapery has a graceful carelessness suitable to the humble characters it adorns. There is scarcely a painter in the academy who can vie with this excellent artist in the force with which he relieves his objects, while he preserves the mellowness and harmony of his colouring and effect. Sir Joshua appears to revive in this pupil of nature. He indeed has more firmness and precision of outline and drawing than that famous painter; and equally captivates by his faithful delineations of the lovely objects of humble life." An exquisitely finished Cupid, executed for the late Sir Thomas Heathcote, and the Fortune-Teller, painted for that patriotic encourager of the arts of his own country, Sir John Leicester, are like-

wise among the most pleasing and interesting productions of the British school.

On the 10th of February, 1806, Mr. Owen was elected a royal academician. At this period he was enjoying the fruits of long study and perseverance in the full practice of his profession. On his being appointed principal portrait-painter to his royal highness the prince regent in 1813, the honour of knighthood was offered to Mr. Owen, but he respectfully requested permission to decline it. In 1814, when the Louvre was filled with all the finest works of art in the world, Mr. Owen visited Paris in company with his friends Colonel Ansley and Mr. Callcott, the royal academician. Mr. Owen may be considered as having been at the height of his prosperity in 1817. It appears by a series of annual pocket-books (which contained the only accounts he ever kept) that at that time his practice produced him 3000*l.* a year; so that had his health continued he was in a fair way of realizing a large fortune. In 1818 he removed to Bruton Street, and it was with something like a presentiment of evil that he did so; for he expressed much regret at leaving his house at Piccadilly, and his painting-rooms in Leicester Square, where he had worked through all his difficulties, acquired his high reputation, and was rapidly accumulating wealth. Unhappily his evil boding proved to be but too well grounded, for the seeds were already sown of that disease, which soon after occupying his new residence made its appearance, and eventually confined him to a sick bed, and entirely incapacitated him for pursuing his profession.

In 1818 he visited Cheltenham, where he received so much benefit from the waters as to be enabled, with improved health, to travel into Staffordshire.

The following year Mr. Owen went to Bath, but he returned to town without having derived any benefit from his journey. Soon after he was confined to his bed, from which he never again rose, and for five years the only change he experienced was in being wheeled in the morning from his sleeping-room on the first floor to his drawing-room, and back at night. One exception indeed was made to this painfully monotonous existence, by a removal to a pleasant part of Chelsea about six months previous to his decease, in the hope that a change of air and scene might at least renovate his spirits, but the trial was unsuccessful, and at no period of his long illness did he ever suffer so seriously as during this short absence from home, to which he gladly returned in little more than a fortnight.

Though Mr. Owen was at length reduced to such a state that protracted existence was neither to be expected nor to be desired, yet the immediate cause of his death was of a sudden and melancholy nature. He had been for some time in the habit of taking an opening draught prescribed by Sir Anthony Carlisle, and he also took every evening thirty drops of a preparation of opium known by the name of Battley's Drops. In consequence, however, of the carelessness of an assistant at a chemist's shop, where Mr. Owen's medicines were usually procured, who erroneously labelled two phials, the one containing the opening draught and the other Battley's Drops, Mr. Owen, very early in the morning of Friday the 11th of February, 1825, swallowed the whole contents of a phial of the latter. He soon became exceedingly lethargic, and his appearance exciting a suspicion of the mistake that had been committed, medical as-

sistance was instantly sent for. Attempts, which were partially successful, were made to dislodge the laudanum. Mr. Owen, however, who was in a state of stupor, gradually became worse, and after lingering until nearly four o'clock in the afternoon, he expired.

OXENSTIERN, AXEL, COUNT OF, a Swedish statesman, who was born at Fano, in Upland, in 1583. His own inclinations and the wishes of his family having destined him for the church he applied himself at Rostock, Wittenberg, and Jena, principally to theology, for the study of which he always retained a predilection. After finishing his studies he visited most of the German courts, and in 1602 returned to Sweden. In 1606 Charles IX. sent him on a public mission to Mecklenburg, and in 1608 he was admitted into the senate, in which his thirteen immediate ancestors had held a seat. The infirmities of age having induced his sovereign not long after to appoint a regency, Oxenstiern was placed at the head of it, and on the accession of Gustavus Adolphus, was made chancellor. In 1614 he accompanied the new king to Germany, and soon after had the satisfaction of seeing the hostilities between Sweden and Russia terminated by the honourable peace of Stolhova. He was subsequently appointed governor-general of all the conquests of the Swedish arms in Germany; and when Gustavus penetrated into the heart of that country, Oxenstiern was invested with full powers in all affairs, both civil and military, on the Rhine, and fixed his head-quarters at Mentz, while Gustavus advanced into Bavaria and Franconia. On the fall of his master at Lutzen, he exerted himself in every way to protect Sweden and her allies, and visited Dresden and Berlin to concert measures for continuing the war. The Swedish government conferred on him full powers to adopt any measures which he considered for the public good. He therefore assembled a congress at Heilbronn, in which he was recognised as the head of the protestant league. This league was held together and supported solely by his influence and wisdom, and in 1636 he returned to Sweden, after an absence of ten years, laid down his extraordinary powers, and took his seat in the senate as chancellor of the kingdom and one of the five guardians of the queen. His great aim was to bring the German war to a successful conclusion, and with this design he sent his son John to Germany in the capacity of Swedish plenipotentiary. In 1645 he assisted in the negotiations with Denmark at Brounsebro, and on his return was created count by Queen Christiana, and at the same time was elected chancellor of the university of Upsal.

When the queen declared her intention of naming her successor, Oxenstiern opposed that measure with all his influence, and resisted with still stronger urgency her determination to abdicate the crown. Finding her, however, fixed in her resolution, he pretended sickness as an excuse for staying away, and taking no part in a step which he foresaw would be the beginning of evil. From that time he took no pleasure in public affairs, although he continued to serve his country with zeal and ability until his death in 1654. Oxenstiern must be ranked among the greatest men who have taken a distinguished part in the affairs of the European world. Great and elevated views, a wonderful political sagacity and foresight, firmness and loftiness of purpose, wisdom in contriving, and prudence and energy in executing, a

strict integrity, and a constant devotion to the welfare of his country, are among the characteristics of this great statesman. The constitution which was prepared by him, and accepted by the states of Sweden in 1634, is esteemed a political masterpiece.

**PACE, RICHARD**, a learned English divine, who was born in the year 1482. He was educated at the charge of Thomas Langton, bishop of Winchester, whom he served as an amanuensis, and afterwards entered into the service of Cardinal Bainbridge. Henry VIII. made him secretary of state, and on entering into holy orders he was admitted prebendary in the church of York, archdeacon of Dorset, and dean of St. Paul's, &c., which preferments were conferred on him during his absence on foreign embassies. On the death of Leo X. he was sent to Rome to solicit the papal chair for Cardinal Wolsey, but a new pope was elected before his arrival,—a circumstance that proved particularly unfortunate to him as the cardinal was ever after his enemy. By the king's order he was sent to the Tower, where he remained two years, till he was discharged by the king's command. When he was enlarged he resigned his deaneries, and died in retirement at Stepney in 1532, after having wrote several works. There is a just character of him by Leland, written upon his return from Venice. He was much esteemed by the learned men of his time, especially Sir Thomas More and Erasmus, and the latter entertained a high opinion of Pace. Stow gives him the character of a "right worthy man, and one that gave in council faithful advice; learned he was also," says that antiquary, "and endowed with many excellent parts and gifts of nature; courteous, pleasant, and delighting in music."

**PACK, RICHARDSON**, a miscellaneous writer, who lived in the beginning of the last century. He was educated at Oxford, after which he entered the army, and rose to the rank of major. Among his literary works we may mention his "Life of Pomponius Atticus," and his "Tale of Religion and Philosophy." He died in 1728.

**PACELLI, ASPIRILIO**, a musical composer, who was born in 1570 at Vasciano in Italy. He was first director of music in the German college in Rome, but received an invitation from King Sigismund III. of Poland to Warsaw as royal chapel-master, which office he filled with great credit to himself for upwards of twenty years, and died there in 1623. Of his printed works we may enumerate, "Cantiones Sacre," "Psalmi et Motetti," "Psalmi Motetti, et Magnificat." Some of Pacelli's pieces are also to be found amongst "Fabio Constantini, Selectæ Cantiones Excellentissim. Autor."

**PACHELBEL, WILHELM HIERON**, was born at Erfurt about the year 1685. His father taught him the harpsichord and composition, by means of which instruction he acquired sufficient skill to fill with credit the situation of organist at Wahre, near Nuremburg. In 1706 he was nominated organist of St. James's church at Nuremburg. His published works are, "Musical Amusements, consisting of a Prelude, Fugue, and Fantasia, for the Organ or Harpsichord." He died at an advanced age.

**PACHELBEL, JOHANN**, a celebrated organist and composer, who was born at Nuremburg in the year 1653. Having a strong inclination for science, he studied for some time at Altdorff, and subsequently removed to the gymnasium poeticum, Regensburg. On

his quitting Regensburg he went to Vienna, and became deputy to the organist of St. Stephen's church in that city. This situation, though attended with little profit, he found very agreeable, as it procured him the friendship and acquaintance of Kerl, at that time chapel-master at Vienna. In 1675 Pachelbel was sent for to Eisenach, and was there raised to the dignity of court-organist. Three years afterwards he removed to Erfurt, where his talents obtained him great applause. In 1690 he was invited to Stuttgart, but that city being threatened with invasion by the French, he quitted it, and settled at Gotha. Not long after this, on the death of Wecher, he succeeded to his place as organist of Nuremburg, in which he continued till his own death in 1706. Pachelbel is celebrated as one of the most excellent of the German organists, of whom Kerl is accounted the father.

**PAER, FERDINANDO**, an eminent musical composer, who was born at Parma in 1774. Having completed his preparatory education, he began to study composition under some of the best masters of the day. His first production was the opera of "Circe," which was very successful. Shortly after the duke of Parma, who was his godfather, bestowed on him a pension, giving him permission to travel to Vienna for the purpose of composing some works in that city. On the death of Naumann in 1801, Paer was invited to Dresden, with the appointment of chapel-master for life. The death of the duke of Parma gave Paer the opportunity of accepting the offer of the elector of Saxony; and he accordingly soon after arrived at Dresden, where he composed several operas, each of which met with brilliant success. After the battle of Jena, Napoleon, being at Dresden, desired that Paer with his wife, who was an excellent singer, should be engaged in his suite. They accordingly followed the emperor to Posen and Warsaw, where they gave several concerts, at which Napoleon was present, who afterwards obtained their regular discharge from the Saxon court, and engaged Paer for the court of France, upon which he proceeded to Paris. The situations which he held under Napoleon were, conductor of the chamber-music and composer to the emperor.

**PAEZ, GENERAL**, a celebrated military leader in South America, who, when the revolution of Caraccas broke out in 1810, declared himself in favour of independence; and his influence with the *llaneros* enabled him to gather round him a body of cavalry, which soon became the terror of the Spaniards. Bolivar soon gave him a command in the regular army, and employed him in duties suited to his own character and that of his half-disciplined troops, who were of great service in partisan warfare. In 1813 and 1814 General Paez rendered important services, and in the succeeding years distinguished himself on almost every occasion. Thus, in 1817, we find him beating, near San Fernando de Apure, a large royalist force under Morillo; and not long after he took possession of Calabozo. At the battle of Ortiz he made several successful charges, and was directed by Bolivar to cover the retreat, which he did with great skill. Throughout Morillo's sanguinary campaigns Paez continually hung upon his rear, or attacked his van, always present where any blow could be struck. After the refusal of the former to give quarter the latter never spared the life of a prisoner; and if, as in the plains of Cojados, his cavalry were cut up, he retired to the plains of Apure, and soon re-appeared

at the head of a new body of South American Cosacks.

In the battle of Carabobo, which took place in 1821, and which established his military reputation, Paéz had charge of the leading division, which it was necessary should penetrate a narrow defile, the heights commanding which were covered with the royalist artillery. He dashed forward with such impetuosity at the head of his troops, that he drove the Spaniards from their position and decided the battle. His services in this victory, which may be considered as securing the independence of Colombia, were considered of such importance that Bolívar offered to appoint him general-in-chief of the army on the field of battle. On the organization of the government which ensued, Paéz was elected a member of the senate for the department of Venezuela, and appointed commandant-general of that department. Although without early education, yet after the tranquil period which followed the expulsion of the Spaniards from Venezuela, he made a rapid progress in those elements of knowledge in which he was most deficient. Disaffection to the confederacy had for several years prevailed in Venezuela, which was carried to its height by an order of the executive, requiring a general enlistment in the militia of all citizens between sixteen and fifty years of age. Complaints being made to the house of representatives of some measures taken by General Paéz in 1826 to enforce the execution of the decree, that body rather hastily determined to impeach him for official misconduct at the bar of the senate. Paéz, however, instigated the Valencians to acts of tumult in consequence of his suspension, and then accepted the command which was conferred on him by the acclamations of the multitude. To secure the support of the rest of Venezuela, his partisans now openly declared for the views of those disaffected to the constitution; and this measure, together with the dread of the soldiery, who were wholly in the interest of Paéz, effected the desired purpose. Venezuela was thus in a state of revolt; other parts of the republic were in the same situation, and affairs remained in this unsettled state till the return of Bolívar from Peru. On his arrival every trace of insurrection disappeared, and in January 1827 he had restored tranquillity by proclaiming a general amnesty, promising to convoke a great national convention to settle all questions in dispute, and recognising General Paéz as commander in Venezuela. In September 1829 Venezuela declared itself independent, and General Paéz was soon after chosen president of the new republic.

PAGAN, BLAISE FRANÇOIS COMTE DE, an eminent French mathematician, who was born at Avignon in Provence, on the 3rd of March, 1604, and became a soldier at the age of fourteen. In 1620 he was engaged at the siege of Caen, in the battle of Pont de Cé, and the reduction of the Navareins, where he signalized himself by his bravery. He was present in 1621 at the siege of St. John d'Angeli, as also that of Clarac and Montauban, where he lost his left eye by a musket-shot, and his patron, the constable of Luynes, was killed. Having recovered from his wound he distinguished himself at the passage of the Alps, and at the barricade of Suza he put himself at the head of the forlorn hope. He had afterwards the pleasure of standing on the left hand of the king, when his majesty related this heroic action to the duke of Savoy with deserved commendations, in

the presence of a very full court. When the king laid siege to Nancy in 1633, Pagan had the honour to attend his sovereign in drawing the lines and forts of circumvallation. In 1642 his majesty sent him to the service in Portugal, in the post of field-marshal. In that year he lost his eye-sight entirely. But though he was thus disabled from serving his country in the field, he re-assumed the study of mathematics and fortification; and in 1645 published a treatise on this latter subject. In 1651 he published his "Geometrical Theorems," which show a perfect knowledge of all the parts of mathematics. In 1655 he printed "A Paraphrase of the Account (in Spanish) of the River of the Amazons," by Father de Rennes, a Jesuit. In 1657 he published "The Theory of the Planets." Shortly after he published his "Astronomical Tables." He died at Paris on the 18th of November, 1665.

PAGANINI, NICOLO, the most renowned violin player of the age. He was born at Genoa in February 1784. His father, who had some skill on the violin, put an instrument into Nicolo's hand as soon as he could hold it, and made him sit beside him and play from morning to night, which Paganini himself considered as the foundation of the ill-health which was ever after his portion. He already began to show much promise of excellence, when his mother dreamed that an angel appeared to her, whom she besought to make her Nicoli a great violin player. Her aspirations for his musical fame accompanied him through his career. In a letter which she wrote to him when at Vienna in 1828, she says, "Take care and do your utmost that your name may be immortal." In his eighth year he had written a sonata, which, however, along with many other juvenile productions, he afterwards destroyed. His first public appearance was in the great theatre at Genoa, where he played the French air "La Carmagnole" with his own variations. He was then in his ninth year, and was rewarded with great applause. His father, intending to place him under the tuition of the well-known musician Rolla, in Parma, carried him to his house. Rolla happened to be ill and lying in bed, the party were shown into the antechamber, where the young Paganini played one of the composer's concertos at sight. Rollo started up, and could scarcely be prevailed upon to believe that he had heard a little boy. "For God's sake," said he, "go to Paer: your time would be lost with me: I can do nothing for you." They went accordingly to Paer, who placed him under Ghiretti, his own teacher, from Naples, whose instruction in counterpoint he enjoyed for six months. During this period he wrote twenty-four fugues for four hands, with pen, ink, and paper, alone, and without an instrument, which his master did not allow him. Paer also gave him compositions to work out, which he himself revised.

His father now took him to Milan, Bologna, Florence, Pisa, Leghorn, and other cities of Upper and Central Italy, where he obtained much money by exhibiting him. Paganini, having arrived at his fifteenth year, wished to get rid of his father's severe discipline and spare diet. He therefore went to Lucca, where a great musical festival was given. His performance as a solo player succeeded here so well that he resolved to travel on his own account, and the attachment which he formed for a wandering life led him to decline many handsome offers to establish himself as a concerto player, or as director of

an orchestra. Though he remained for some time at the court of Lucca, he soon resumed his itinerant habits, Genoa being usually his head-quarters. He soon amassed about 20,000 francs, half of which he proposed to give to his parents; but his father insisted upon the whole, and went so far as to threaten his son with instant death if he refused, so that Paganini gave up the greater part of the sum. He became the idol of the Italians. The pope bestowed upon him the order of the Golden Spur. Paganini, however, bore all these honours with singular modesty, and strove unremittedly for greater excellence. Lafont, the Parisian violinist, challenged him to a public contest: the offer was accepted, and he surpassed his antagonist entirely. The same passages which Lafont had performed in single stops, he executed in double; rapid successions which the one had achieved in double ordinary sounds, the other produced in the most perfect manner in double harmonic sounds; where the one had accompanied his melodies with chords, the other superadded to the chords the most rapid and distinct pizzicatos with the left hand; where Lafont had astonished the audience with his octaves and tenths, Paganini amazed them still more by stretching, with the same ease, fourteenths and sixteenths. He was thus declared the victor. In 1828 he went to Vienna, and received great applause.

His striking superiority led to the supposition that the means of its attainment must have been much out of the ordinary course, and an idle story was circulated that he had attained his skill by constant practice in a dungeon; and his strange looks and haggard appearance tended to confirm the report. The causes assigned for his supposed confinement were various. One was that he had stabbed or poisoned his wife. The story became universally believed, although totally unfounded. Paganini was never fully aware of the light in which he was regarded until the theatrical gazette at Vienna dropped some broad hints as to his rumoured misdeeds. Upon this he immediately published in the papers a statement, in German and Italian, declaring that he never had offended against the laws, and referring to the magistracies of the different states in which he had lived. His command of the back-string of the violin has always been an especial theme of wonder. He subsequently visited Berlin, Paris, London, and other great cities of Europe; and all who heard him agreed in declaring that the violin became in his hand a totally different instrument from what they had ever supposed it, and agreed in considering his performance perfection.

PAGE, WILLIAM, a learned English scholar, who was born at Fordsham, in Cheshire. At an early age he was sent to Westminster school, whence in 1796 he was elected to a studentship of Christ Church, Oxford. There he took the degree of M. A. in 1802, of B. D. in 1809, and of D. D. in 1815. In 1802 he was appointed to the under-mastership of Westminster school, vacant by the promotion of Dr. Wingfield as successor to Dr. Vincent. On the resignation of Dr. Carey in 1804 he became head master.

Dr. Page, soon after his appointment at Westminster, married, and left at his death a family of four sons and five daughters. Dr. Page died in September 1819, of a pulmonary consumption. He possessed considerable talents for composition, and to his pen have been attributed most of the prologues to the plays of Terence, performed in the Dormitory,

as well as the epigrams recited at the election of king's scholars.

PAGI, ANTONY, a celebrated critic, who was born at Rogné, in Provence, in 1624. He afterwards took the habit in the convent at Arles, and was four times provincial of his order; but his religious duties did not prevent his application to the study of chronology and ecclesiastical history, in which he excelled. His most considerable work is, "A Critique upon the Annals of Baronius." He published the first volume in 1689, dedicated to the clergy of France, who allowed him a pension: the whole was printed after his death, in four volumes folio, at Geneva. His death took place in 1699. Pagi also wrote "A Chronological Abridgment of the History of the Popes" in Latin.

PAGNINUS, SANCTES, an Italian Dominican, who was eminent for his skill in oriental languages and biblical learning. He was born at Lucca in 1466, and became afterwards an ecclesiastic of the order of St. Dominic. He was an excellent scholar, and devoted several years to the examination of translations of the scriptures. This design was approved by Leo. X., who promised to furnish him with all necessary expenses for carrying on the work; and we find at the beginning of his own translation, which was printed at Lyons in 1527, two letters of the succeeding popes, Hadrian VI. and Clement VII., which licensed the printing of it. Pagninus spent twenty-five years upon this translation, which is considered one of the best modern translations of the Bible from the Hebrew text. He also translated the New Testament from the Greek, as he had done the Old from the Hebrew, and dedicated it to Pope Clement VII. He was author of a Hebrew Lexicon, and an Hebrew Grammar; which Buxtorf, who calls him "vir linguarum Orientalium peritissimus," made great use of in compiling his. He died in 1536.

PAINE, ROBERT TREAT, a distinguished American, who was one of the signers of the declaration of independence. He was born at Boston in 1731. His father had been for some time pastor of a church in Weymouth, near Boston; but in consequence of ill health he had removed to the latter place, where he engaged in mercantile pursuits. When fourteen years old he became a student in Harvard college, and after leaving it, kept for a period a public school, the fortune of his father having been greatly reduced. He contributed in this way to the support of his parents, and likewise made a voyage to Europe with the view of acquiring ampler means for their maintenance. In 1755 he acted as chaplain to the troops of the provinces at the northward, having previously studied theology. Not long afterwards, however, he devoted his attention to the law, and during the prosecution of his studies again kept a school for his support. On being admitted to the bar he established himself at Taunton, in the county of Bristol, where he resided for many years. In 1762 he was chosen a delegate from that town to the convention called by the leading men of Boston, in consequence of the abrupt dissolution of the general court by Governor Barnard.

In 1770 he conducted the prosecution on the part of the crown, in the absence of the attorney-general, in the celebrated trial of Captain Preston and his men, for the part which they acted in the well-known Boston massacre. The way in which he discharged that duty gave him great reputation. In 1773 he was elected a representative to the general assembly from

Taunton. He was afterwards chosen a member of the continental congress which met at Philadelphia in 1774. The following year he was re-elected, and rendered important services as chairman of the committee named for the purpose of introducing the manufacture of saltpetre, which was then but imperfectly understood, while the colonies were suffering from the want of gunpowder; also as member of a committee for the encouragement of the manufacture of cannon and other implements of war. In 1776, 1777, and 1778, he was also in congress, and in the intervals of their sessions filled several important offices in Massachusetts. In 1780 he was sent to the convention which met in order to deliberate respecting a constitution for that commonwealth, and of the committee which framed the instrument he was a conspicuous member. Under the government which was organized he was appointed attorney-general. This office he held until 1790, when he was raised to the bench of the supreme court, where he continued to sit until 1804. He was then seventy-three years old. He died on the 11th of May, 1814, in the eighty-fifth year of his age. As a lawyer Mr. Paine acquired a high rank: his legal attainments were extensive, and his strict fidelity in discharging his duties as attorney-general gave him the reputation of unnecessary severity. His judicial functions he discharged ably, and with the utmost impartiality. To various literary and religious institutions he rendered important services. He was an excellent scholar, and in quickness of apprehension, liveliness of imagination, and general intelligence, he was inferior to few. His memory was exceedingly retentive. His conversation was distinguished for its sprightliness; and if he was sometimes fond of indulging in raillery, he evinced no ill-humour at being the subject of it in his turn. He was a founder of the American academy established in Massachusetts in 1780, and continued his services to it until his death.

PAINE, THOMAS, a celebrated political and deistical writer, who was born in 1737 at Thetford in Norfolk, where his father was a staymaker. He received his education at a grammar school in his native place, but attained to little beyond the rudiments of the Latin language. He seems afterwards to have paid great attention to arithmetic, and to have obtained some knowledge of the mathematics. In early life he followed the business of his father, and afterwards became a grocer and exciseman at Lewes in Sussex, but was dismissed for keeping a tobacconist's shop, which was incompatible with his duties. He afterwards published a pamphlet which excited considerable attention, and passing over to America, published his "Common Sense." For this he received from the legislature of Pennsylvania the sum of 500*l.*, and soon after this he was honoured with a degree (M. A.) from the university of Pennsylvania, and chosen a member of the American philosophical society. In the title page of his "Rights of Man," he styled himself "Secretary for Foreign Affairs to the Congress of the United States in the Late War." To this title, however, he had no pretensions, and so thorough a republican ought at least to have avoided assuming what he condemned so vehemently in others. He was merely a clerk, at a very low salary, to a committee of the congress; and his business was to copy papers, and number and file them. From this office, however, he was dismissed for a breach of trust, and early in 1780 the assembly of

Pennsylvania chose him as clerk. In 1782 he printed at Philadelphia a letter to the abbé Raynal on the affairs of North America, in which he undertook to clear up the mistakes in Raynal's account of the revolution, and in the same year he also printed a letter to the earl of Shelburne on his speech in parliament, July 10, 1782, in which that nobleman had prophesied that, "When Great Britain shall acknowledge American independence, the sun of Britain's glory is set for ever."

In 1787 Paine returned to England, and he was shortly afterwards imprisoned for debt in the metropolis. In 1790 appeared the first part of "The Rights of Man;" and two years afterwards the completion of the work. Prosecutions having been commenced against him, he made his escape to France, where he was consigned to a dungeon by Robespierre. "The Age of Reason" appeared in 1794. Tired of France, where he found but few friends, he proceeded in 1802 to America, where he appeared under the protection of the president Jefferson, but was no longer an object of curiosity, unless among the lower classes of emigrants from England, Scotland, or Ireland. With them it appears "he drank grog in the tap-room morning, noon, and night; admired and praised, strutting and staggering about, showing himself to all, and shaking hands with all; but the leaders of the party to which he had attached himself paid him no attention." He had brought with him to America a woman named Bonneville, whom he had seduced from her husband, with her two sons; and whom he seems to have treated with the utmost meanness and tyranny. The closing scene of his life, as related by his medical attendant, Dr. Manly, is too instructive and admonitory to be omitted:—"During the latter part of his life," says this physician, "though his conversation was equivocal, his conduct was singular. He would not be left alone night or day. He not only required to have some person with him, but he must see that he or she was there, and would not allow his curtain to be closed at any time; and if, as it would sometimes unavoidably happen, he was left alone, he would scream and halloo until some person came to him. When relief from pain would admit, he seemed thoughtful and contemplative, his eyes being generally closed, and his hands folded upon his breast, although he never slept without the assistance of an anodyne. There was something remarkable in his conduct about this period (which comprises about two weeks immediately preceding his death), particularly when we reflect that Thomas Paine was author of 'The Age of Reason.' He would call out during his paroxysms of distress, without intermission, 'O Lord help me, God help me, Jesus Christ help me, O Lord help me,' &c., repeating the same expression without any the least variation, in a tone of voice that would alarm the house. It was this conduct which induced me to think that he had abandoned his former opinions; and I was more inclined to that belief when I understood from his nurse (who is a very serious, and I believe pious woman), that he would occasionally inquire, when he saw her engaged with a book, what she was reading, and being answered, and at the same time asked whether she should read aloud, he assented, and would appear to give particular attention. The book she usually read was 'Hobart's Companion for the Altar.'

"I took occasion, during the night of the 5th and

6th of June, to test the strength of his opinions respecting revelation. I purposely made him a very late visit; it was a time which seemed to sort exactly with my errand; it was midnight; he was in great distress, constantly exclaiming in the words above-mentioned; when, after a considerable preface, I addressed him in the following manner, the nurse being present:—'Mr. Paine, your opinions by a large portion of the community have been treated with deference; you have never been in the habit of mixing in your conversation words of course; you have never indulged in the practice of profane swearing; you must be sensible that we are acquainted with your religious opinions as they are given to the world. What must we think of your present conduct? Why do you call upon Jesus Christ to help you? Do you believe that he can help you? Do you believe in the divinity of Jesus Christ? Come now, answer me honestly; I want an answer as from the lips of a dying man, for I verily believe that you will not live twenty-four hours.' I waited some time at the end of every question; he did not answer, but ceased to exclaim in the above manner. Again I addressed him:—'Mr. Paine, you have not answered my questions; will you answer them? Allow me to ask again, do you believe? or let me qualify the question, do you wish to believe that Jesus Christ is the Son of God?' After a pause of some minutes he answered, 'I have no wish to believe on that subject.' I then left him, and know not whether he afterwards spoke to any person on any subject, though he lived, as I before observed, till the morning of the 8th. Such conduct under usual circumstances I conceive absolutely unaccountable, though with diffidence I would remark, not so much so in the present instance; for though the first necessary and general result of conviction be a sincere wish to atone for evil committed, yet it may be a question worthy of *able* consideration whether excessive pride of opinion, consummate vanity, and inordinate self-love, might not prevent or retard that otherwise natural consequence?"

Thus died a man who originally possessed a strong mind, united to considerable literary attainments, both of which he most fearfully abused; but his latter end, as depicted above, sufficiently vindicates the justice of Providence, even in its earthly dispensations. He lived without God as well as without moral restraint, and he died abandoned by his fellow men, a victim to his own vanity and self-deceit.

PAINTER, WILLIAM, an early English writer, of whose life no materials now exist, and whose only work of any importance is entitled "The Palace of Pleasure." It originally appeared in 1567, and was reprinted in 1813.

PAISIBLE, NATHANIEL, a celebrated violinist. He was one of the best pupils of Gaviniés, who, pleased with his talents, assisted him in obtaining several situations. Early in life he travelled through a part of France, the low countries, Germany, and as far as Petersburg, obtaining every where success as an artist. At Petersburg however, when he wished his playing to become known to the empress, Lolli, who was then in the service of that court, prevented him by his intrigues from being heard by the empress. He then gave two public concerts, which, producing him a sum insufficient for his maintenance, induced him to engage in the service of a Russian count, with whom he went to Moscow. He did not long continue in this office, but again tried two con-

certs, which had worse success than those at St. Petersburg. At length in 1781, driven to distraction by his misfortunes, and harassed with debts which he had no means of satisfying but by the sale of his very valuable violin, he formed the fatal resolution to terminate his existence, and accordingly blew out his brains, leaving a letter taking farewell of his friends, and desiring them to pay his debts by the sale of his violin. He published several operas.

PAISIELLO, GIOVANNI, a musician, who was born at Tarento in the year 1741. His father was a veterinary surgeon, particularly distinguished in his art; and the reputation he had acquired procured him the honour of being employed by the king of Naples, Charles III., during the war of Velletri. His father determined, as soon as his son had attained his fifth year, that he should study till he was thirteen with the Jesuits who had a college at Tarento; and, as it was the custom of these fathers to have the service to the Virgin sung in all their festivals, they remarked, when their young pupil sang the hours of matins, that he had a fine contralto voice and an excellent ear. Upon this observation the chevalier D. Girolama Carducci, of the same city, and who superintended the music for the holy week in the church of the Capuchins, endeavoured to make young Paisiello sing some pieces from memory. The boy, who was then under thirteen years of age, acquitted himself so well that the chevalier Carducci, perceiving the promising genius of Paisiello, advised his father to send him to Naples in order that he might study music, and for this purpose instantly to place him with some good master.

He accordingly set out for Naples with his father, and in June 1754 was received into the conservatorio of St. Onofrio, where he had the happiness of finding, as a master, the celebrated Durante. It was under him that he studied, and at the end of five years became first master among the pupils of the conservatorio. During the next four years he composed there some masses, psalms, motets, oratorios, and a comic interlude, which was performed in the same institution. This interlude procured him the advantage of being employed to compose, in 1763, an opera for the theatre at Bologna.

In July 1766 Paisiello departed for Russia, and entered the service of Catherine II., with an appointment of 4000 rubles. As music master to the grand duchess, he had the further sum of 900 rubles; and his country house, which was allowed him during five or six months in the year, procured him 2000 rubles. With these and some other advantages, he had an annual income of 9000 rubles. Paisiello remained in Russia nine years. During his residence in that country he composed for his pupil, the grand duchess Maria Federowna, wife of the grand duke Paul Petrowitz, afterwards empress, several sonatas and pieces for the piano. He also arranged a collection of rules for the accompaniment of a score on the pianoforte. This small treatise was printed in Russia, and on this occasion the empress presented him with an annual pension of 900 rubles. At Warsaw he composed the oratorio of "La Passione," set to Metastasio's words, for King Poniatowski. At Vienna he wrote for the emperor Joseph II. the opera of "Il Re Teodoro," and twelve concerted symphonies. From thence he returned to Naples.

At this time Paisiello received from the king of

Prussia an invitation to Berlin, but which he could not accept, being in the service of the king of Naples, Ferdinand IV. of Bourbon. A short time after he gave at Naples "*I Zingari in Fiera*," and composed for the obsequies of General Hoche a funeral symphony, which procured him a recompence from General Bonaparte. He was now invited to take a new engagement in Russia; but the motives which had induced him to refuse the offers of the king of Prussia prevented him from accepting those of the court of Russia. The king of Naples commanded him to set to music "*Nina, o la Pazza d'Amore*," for the little country theatre of the Belvidere.

The French revolution having extended to Naples in 1789, the government assumed the republican form. The court abandoning Naples and returning into Sicily, the rulers of the state named Paisiello composer to the nation. But the Bourbon family, being re-established, made it a crime in him to have accepted this employment, and for some time his appointments were suspended. At last, after two years had elapsed, he was restored to his situation. He was afterwards demanded at Paris by the first consul of France, Napoleon Bonaparte; when Ferdinand, king of Naples, gave him a despatch with an order to go to Paris, and place himself at the disposal of the first consul. Alquier, the minister of France, resident at Naples, pressed him on this occasion to declare his intentions respecting the fees and the treatment he desired. Paisiello replied, that the honour of serving the first consul he considered as a sufficient recompence. On arriving at Paris he was provided with a furnished apartment and one of the court carriages; he was also assigned a salary of 12,000 francs, and a present of 18,000 francs for the expenses of his stay, besides those of his journey. He was offered at Paris several appointments, such as director of the imperial academy and of the conservatorio; he refused them all, and contented himself with that of director of the chapel, which he filled with excellent artists. He composed for this chapel sixteen sacred services, consisting of masses, motets, prayers, &c., and besides these he set the opera of "*Proserpine*" for the academy of music, and a grand mass for two choirs, a "*Te-Deum*," and prayers for the coronation of the emperor. Finding that the climate of Paris did not agree with his wife, he quitted that city, after residing in it two years and a half, and returned to Italy; he still, however, continued to send every year to Napoleon a sacred composition for the anniversary of his birth, the 15th of August. A year after his departure, the emperor proposed to him to return to Paris, but the state of his health prevented him from accepting the invitation. The Bourbon family being obliged to quit Naples, Joseph Napoleon confirmed to him the place of master of the chapel, of composer and director of the music of his chamber and of his chapel, with an appointment of 1800 ducats. He wrote for this chapel twenty-four services, consisting of masses, motets, and prayers.

At the same time Napoleon sent him the cross of the Legion of Honour, which Joseph himself presented to him, with an additional pension of 1000 francs. Subsequently to this period he composed the opera "*Dei Pittagorici*," which might serve as a model both to poets and musicians, and procured him the decoration of the order of the Two Sicilies from the king; he was also named a member of the

royal society of Naples, and president of the musical direction of the royal conservatorio. King Joseph having gone to Spain, Murat, who succeeded him, confirmed Paisiello in all his employments. At the period of the emperor's marriage with the archduchess of Austria, Paisiello thought it his duty to present her majesty with a sacred composition; and in token of her thanks the empress sent him a present of 4000 francs, accompanied with a letter addressed to him, from the grand marshal of the palace, containing the acknowledgments of her majesty. Besides the offices already spoken of, Paisiello was chapel-master of the cathedral of Naples, for which he composed several services alla Palestrina; he was also chapel-master to the municipality.

It was Paisiello who had the merit of being the means of effecting the removal of the prohibition on the audience from applauding composers and singers in the theatre of San Carlos; the king set the example of the change by applauding an air sung by Carlo Raina, in the opera of "*Papirus*."

Paisiello was named a member of many learned societies, such as of the Napoleon academy of Lucca; the Italian academy, then sitting at Leghorn; and the society of the children of Apollo at Paris; and on the 30th of December, 1809, he was elected an associate of the institute of France. He died in Italy, in the year 1816, aged seventy-six. That city rendered him funeral honours, in causing to be executed a mass for the dead, found among his papers. The same evening his "*Nina*" was performed at the opera, when the king of Naples and the whole court attended.

PALESTRINA, GIOVANNI PIETRO, a celebrated Italian composer, who was born at the city of Palestrina in 1529. From the ancient custom of naming the master with the scholar and his country, many of the Italian writers have thought it necessary to say that he was a scholar of Giovanni Mell, Fiamingo, a Fleming; by whom they had been generally understood to mean Claude Goudimel, a native of Franche Comté, and a Huguenot, who was one of the first that set the translation of the psalms by Clement Marot and Theodore Beza to music, and who was murdered at Lyons in 1572, on the fatal day of the massacre of Paris.

Young Palestrina having distinguished himself as a composer about 1555, he was admitted into the pope's chapel at Rome; in 1562, at the age of thirty-three, he was elected chapel-master of Santa Maria Maggiore, in the same city, as, upon the death of Giovanni Animuccia, in 1571, he was honoured with a similar appointment at St. Peter's; and lastly, having brought choral harmony to a degree of perfection that has never since been exceeded, he died in the year 1594, at the age of forty-five. The following account of his death and burial was entered in the register of the pontifical chapel:—

"February 2, 1594.—This morning died the most excellent musician, Signor Giovanni Palestrina, our dear companion, and maestro di capella of St. Peter's church, whither his funeral was attended, not only by all the musicians of Rome, but by an infinite concourse of people, when '*Libera me, Domine*' was sung by the whole college." To this account Adami adds that of Torrigio, who says: "In St. Peter's church, near the altar of St. Simon and St. Jude, was interred, in consequence of his extraordinary abilities, Pierluigi da Palestrina, the great musical composer, and maestro di capella of his church. His fu-

neral was attended by all the musicians of Rome, and 'Libera me, Domine, as composed by himself, in five parts, was sung by three choirs."

"Some judgment may be formed," says the learned author of the "Essay on Counterpoint," "of the great veneration in which he was held by the professors of his own time, from a collection of psalms, in five parts, that was published in 1592, and dedicated to Palestrina by fourteen of the greatest masters of Italy at that time."

**PALEY, WILLIAM.**—The character of this truly Christian philosopher stands out as a bright and shining light in the profession in which Providence had placed him. In Paley, precept and example mutually responded to each other, and his learning was as profound as his moral character was excellent: indeed his writings have exercised, from their first appearance, so great an influence on the moral character of our countrymen that we must not lightly dismiss him in the present work. He was born near Peterborough in 1743, and educated under his father's eye at Giggleswick. At school he soon surpassed his early class-fellows by the exercise of greater abilities, united to a more studious disposition than usually belongs to boys of that age; and by successive promotions from one class to another, at length obtained pre-eminence over all. He did not at this period distinguish himself by any sort of compositions, even as school exercises, but was considered a very fair, though by no means an accomplished classical scholar. He was even then more attentive to things than to words, and ardent in the pursuit of knowledge of every kind. He was curious in making enquiries about mechanism whenever he had an opportunity of conversing with any workmen, or others capable of affording him satisfactory information. In his mind he was uncommonly active, in his body quite the reverse; he was a bad horseman, and incapable of those exertions which required adroitness in the use of his hands or feet. He never engaged in the ordinary sports of schoolboys, but was fond of angling, an amusement in which he did not then excel, though his attachment to it seems to have continued through life.

Soon after he had completed his fifteenth year, Paley accompanied his father to Cambridge, for the purpose of becoming a sizar of Christ's college; a college otherwise highly respectable from the members who had done it honour, but sufficiently immortalized by the illustrious name of Milton alone. He performed this journey on horseback, and used often thus humourously to describe the disasters which befel him on the road:—"I was never a good horseman, and when I followed my father on a poney of my own on my first journey to Cambridge I fell off seven times! I was lighter then than I am now, and my falls were not likely to be serious, so that I soon began to care very little about them. My father, though at first a good deal alarmed at my awkwardness, afterwards became so accustomed to it that, on hearing a thump, he would only turn his head half aside and say, 'Get up and take care of thy money lad.'"

In October 1759 he became a resident member of Christ's college, and on the first evening after his departure for Cambridge, his father observed to a pupil who was then his only boarder, "My son is now gone to college,—he'll turn out a great man—very great indeed,—I'm certain of it, for he has by

far the clearest head I ever met with in my life." On the 5th of December he was appointed to one of the scholarships founded by Mr. Carr, and appropriated to students from Giggleswick school. On the following day he was elected a scholar on the foundation of his college, and appointed to the exhibition founded by Sir Walter Mildmay; and, in addition to these emoluments, he was elected, May 26th, 1761, to the scholarship founded by Mr. Buntry, one of the college tenants.

We afterwards find Mr. Paley actively engaged at Cambridge in the business of teaching, and here he was a strict economist in the distribution and management of his time. He usually attended chapel at morning prayers, read or wrote whilst at breakfast, and then dedicated the remainder of the forenoon to his public or private pupils. After this he indulged himself in a walk, for the benefit of his health, extending or shortening his distance so as to be back about the time the dinner bell was rung, that he might hastily exchange his morning dress, in which he made a very singular appearance, for the more becoming one which he wore in the hall. He was generally, therefore, the last at table, and having frequently to repel the attacks of his associates on his tardiness, amply atoned for the lateness of his appearance by his lively and pointed repartees. After dinner he seldom remained long in the combination room, employing the interval till tea time in reading for instruction or amusement, though he often limited himself to half an hour a day for books of the latter description. After evening chapel he was again engaged with his pupils till nine o'clock, and then, except when prevented by his lectures, went to a frugal supper.

In the college chapel Mr. Paley used to preach from loose scraps of paper; and except when he had to appear before the university, seldom transcribed his sermons into a regular book. He wrote a scarcely legible hand; which was at once a source of vexation to himself and his friends, and was occasionally productive of very ludicrous effects.

Being equally attentive to the moral and intellectual improvement of his pupils, Mr. Paley omitted no favourable opportunity of impressing their minds with serious and important advice. On their first appearance in college for admission, after examining them in Latin and Greek, he proceeded, amongst other directions for their general conduct, to warn them against mixing too much in company. "Learn to live alone," was on such occasions his emphatic language. Before they were admitted to the communion he used to give them a preparatory lecture; and at all times forcibly inculcated the attention due to the ordinances of religion. He used also to summon them severally to his rooms, where he not only pointed out to them the best method of prosecuting their studies, but earnestly admonished them on every other essential point. With respect to their domestic economy, as he called it, he has been known to recommend some of them not to refuse the loan of a few pounds to a fellow collegian; "because," said he, "if the young man be good for any thing he will repay you; and if not, he will no longer frequent your society; and you will get cheaply rid of a worthless companion." In the course of their undergraduateship he occasionally invited them to breakfast, or took them out as companions in his walks; and on their leaving college he invariably dismissed them

with good counsel, showing the most anxious concern for their future welfare.

But whilst Mr. Paley was thus highly distinguished for his unremitting attention to his pupils, no man could maintain the dignity of his office with greater firmness, if any of them presumed to brave his authority. He threatened one man, who obstinately refused to answer some questions put to him, with immediate expulsion for contumacy, if he dared to persevere; and reproved another who presumed to take some unwarrantable liberties, in consequence of his expected resignation, by sternly declaring, "that he was determined to support the discipline of the college as strenuously, whilst he remained, as if he had intended to spend in it the last moments of his life." His pupils consequently looked up to him with respect and awe; and dreaded, more than any other species of college punishment, a serious reprimand for misconduct, delivered in his solemn and impressive manner. He was very strict in requiring their attendance at his lectures; and the translation of a paper in "The Rambler" into Latin was the usual penalty for an omission. Amongst his various merits as a college tutor, it is difficult to say in what he most excelled; but he was certainly no where more happy than in his method of conveying instruction.

Early in 1775 Mr. Paley offered to a party of his pupils, who had just taken their first degree and were designed for the clerical profession, to give them a course of lectures in divinity, provided that they would seriously devote themselves certain hours a day to the study; an offer which, with a single exception, they all eagerly embraced. These lectures contained the substance of what he afterwards gave to the world in his "Evidences of Christianity," and the germ of the still greater argument on the same subject developed in his "Horæ Paulinæ." For Mr. Paley was already aware that the authenticity of St. Paul's Epistles might be most satisfactorily established by a minute examination of their contents, and particularly by comparing them with the Acts of the Apostles and with each other. He added a useful commentary on some of these epistles; an interesting sketch of the causes of infidelity; and a brief view of the grounds which separate the church of England from that of Rome, as well as from the presbyterians, the methodists, and the quakers. He concluded these lectures with some valuable hints and directions for the study of the gospels, for the composition of sermons, and the other duties of a parish priest, omitting nothing which seemed likely to qualify his hearers for their future destination in life.

Mr. Paley, having frequently declared that he would quit college whenever he could do so with the prospect of a clear annual income of 200*l.*, announced his early intention of retiring, when the bishop of Carlisle presented him to the rectory of Musgrave in Westmoreland, a living scarcely worth above 80*l.* a year. He was inducted to this little benefice, May 28, 1775, and afterwards passed much of his leisure during the long vacation between Rose Castle and Mr. Law's prebendal house at Carlisle. In the autumn of this year he attached himself to Miss Jane Hewitt, a handsome and pleasing young lady of that city, to whom his suit was successfully preferred. He returned, however, to Cambridge at the usual time.

Mr. Paley terminated his labours in the university

on the 30th of May, when he retired into the diocese of Carlisle, leaving behind him the well-earned sentiments of esteem and regret among his friends and pupils; the latter of whom assembled at the college gates to take a respectful leave of him as he hurried from his room into the chaise. On the 6th of June he was married to Miss Hewitt, in the church of St. Mary's, Carlisle, where his friend Mr. Law performed the ceremony; and, on the 29th of the same month, was succeeded in his fellowship by Mr. Majendie, afterwards bishop of Bangor.

Striking as the contrast must appear between his situation in the university and amongst his present parishioners, he frequently observed, that at Musgrave he had passed some of the happiest days of his life. Satisfied with the small earnest of patronage which he had received, no cares about his future prospects disturbed the serenity of his mind. The situation of this pleasant village on the banks of the river Eden allowed him to indulge himself frequently in angling, the favourite amusement of his youth. So partial indeed was he to a sport which, notwithstanding the opinion of honest Walton, can scarcely be reconciled to either reason or humanity, that he at one time kept a journal of his exploits, and had afterwards his portrait taken with his rod and line. Alluding to his success in troubling for pike, he used to say, that the fish, when not hungry, would sometimes nibble without swallowing the bait; in which case he found it necessary to stimulate its appetite by manœuvring; "for," added he, "the pike reasons thus, 'though I am not hungry now, I may be tomorrow, and therefore must not lose so good a prize.'"

At this time Mr. Paley, as he afterwards frequently declared, found himself, notwithstanding his habits of observation and inquiry, very deficient in that practical knowledge which can only be obtained from an active intercourse with the common mass of mankind. Being induced to undertake the management of a small farm, as a source at once of profit and of occupation, he calculated too little on his own want of acquaintance with husbandry and the different habits of his earlier life. "I soon found," said he, when alluding to the failure of his project, "that this would never do: I was a bad farmer and almost invariably lost." The liberality of his benefactor, however, was not confined to a single gift. Before the close of the same year, December 2, 1776, he was inducted into the vicarage of Dalston in Cumberland, in the neighbourhood of Rose Castle, worth about 90*l.* per annum. In 1777 Mr. Law was promoted to the archdeaconry of Carlisle, and, from the age and infirmities of his father, had now the chief management of all the affairs of the diocese, as well as a leading influence with the dean and chapter.

On the 15th of July, 1777, Mr. Paley preached, at the visitation of the bishop, in the cathedral church of Carlisle, a discourse, which he afterwards published with the title of "Caution Recommended in the Use and Application of Scripture Language." Mr. Paley is here an advocate for the sober and solid interpretation of scripture, and his reasoning is well calculated to counterbalance the opinions of those who would transfer indiscriminately many expressions, describing the peculiar circumstances of the first promulgation of the gospel to the present case of the Christian world. Some passages, particularly one against applying the terms "regenerate, born of the

Spirit, new creature," to the personal condition of any individuals of the present day exactly as they were applied to the first apostles and their immediate converts, have been strongly censured by Dr. Knox in the preface to his "Christian Philosophy," whilst the whole discourse has been warmly recommended by Dr. Percival, in communicating an epitome of it to his eldest son.

On the 5th of September Mr. Paley resigned the rectory of Musgrave, and on the 10th of the same month was instituted to the more valuable vicarage of Appleby, estimated at about 200*l.* a-year, on the presentation of the dean and chapter of Carlisle; between which place and Dalston he now divided his time, residing alternately six months at each.

Whilst vicar of Appleby, Mr. Paley gave to the world a small volume, selected from "The Book of Common Prayer," and the writings of several eminent divines, entitled, "The Clergyman's Companion in Visiting the Sick;" a very useful manual, and such as he had probably experienced the want of himself. This compilation was at first published anonymously, but it has since passed through at least nine editions, and is now sanctioned with his name. The professional usefulness of this book to the clergy is no small recommendation of its merits; but when considered as originating in Mr. Paley's personal attention to the spiritual wants of his own flock, it affords an additional and permanent proof of his worth as a parochial minister. On the 17th of June, 1780, he was collated to the fourth prebendal stall in the cathedral church of Carlisle, worth about 400*l.* a year, and thus became the coadjutor of his friend Mr. Law in the chapter.

In 1782 Mr. Paley was appointed dean of Carlisle. The archdeaconry is, in fact, a mere sinecure, the duties usually attached to that office being here performed by the chancellor, whose power extends throughout the whole diocese. The rectory of Great Salkeld, worth 120*l.* per annum, is always annexed to the archdeaconry, and has been so from the foundation of the see.

In 1794 Mr. Paley was promoted to the subdeanery of Lincoln, a preferment of about 700*l.* a year, by Dr. Prettyman, bishop of that diocese; Mr. Paley was installed early in the following year, and from thence proceeded to Cambridge, to take his degree of doctor in divinity. As he was now a master of arts of more than twelve years' standing, the intermediate degree of bachelor in divinity was dispensed with. But before he left Cambridge, where he met with many of his college friends and pupils, Mr. Paley was surprised by a letter from the bishop of Durham, Dr. Barrington, with whom he was not previously acquainted, offering him the valuable rectory of Bishop Wearmouth, estimated at 1200*l.* a year. When he waited upon his new patron, in the metropolis, soon after, and began to express his gratitude, his lordship thus shortly interrupted his acknowledgments: "Not one word more of this, sir, be assured that you cannot have greater pleasure in accepting the living of Bishop Wearmouth than I have in offering it to you." The unsolicited patronage of this eminent moralist was indeed, in every respect, worthy of the son of Viscount Barrington, the friend and disciple of Locke, and one of the most strenuous advocates for religious liberty in his own or any other age.

Besides these distinguished prelates, who conferred new preferments on Mr. Paley, the bishop and dean

and chapter of Carlisle must be recorded as his substantial patrons at this time. The bishop not only readily acquiesced in transferring the presentation of his vacated prebend to the bishop of Lincoln, but afterwards resigned, to the bishop of Durham, the disposal of Stanwix; to whom also the dean and chapter gave up their right to Addingham. Bishop Vernon, indeed, is said to have previously told Mr. Paley, that he might in that manner transfer any preferments which he held in the diocese of Carlisle, as he had no other means of serving him.

Dr. Paley, for he now assumed that title, immediately proceeded to Bishop Wearmouth, and took possession of his valuable cure. The rectory-house at Bishop Wearmouth is one of the best parsonages in the kingdom, and, with the out-offices and adjacent grounds, had been left by the last incumbent in a very improved state. Dr. Paley was therefore highly pleased on viewing the premises, and had indeed good reason to rejoice in his present advantageous change. Having resigned the chancellorship, the last of those preferments which required his residence in the diocese of Carlisle, he removed from a vicinity where he had so long distinguished himself by his upright, independent conduct, and gained the esteem and respect of all to whom he was personally known.

Towards the close of 1804 a very visible change took place in Dr. Paley's health; and in the month of May in the following year he experienced a most violent attack, in which the usual remedies were found ineffectual. Human skill was therefore vain; his appetite failing him he was no longer able to take the requisite support, but soon sunk under the accumulated influence of debility and disease. His sight is supposed to have failed a few days before his death, whilst his other faculties remained unimpaired. Perhaps no man ever preserved greater self-possession and composure during his concluding scene. The evening of his life was clouded with no displeasing recollections, no vain anxieties, no fond regrets; he had enjoyed the blessings of this world with satisfaction, and he relied for future happiness on the promises of that divine revelation, the truth of which he had so strenuously laboured to evince. He consequently met the approach of death with firmness, comforted his afflicted family with the consolations of religion, and late on the evening of Saturday, May 25th, 1805, he tranquilly breathed his last.

As a divine the great aim of Dr. Paley's labours was to maintain the authority of the Gospel as an authentic revelation, and to enforce the practice of virtue by the sanctions of a future life. His views of Christianity, at once cheering and enlightened, were in strict unison with the benevolent spirit of its founder, which appears to have been too much forgotten amidst the animosities of contending sects. The pure religion of the Gospel has indeed been too frequently obscured by ordinances of mere human appointment; and yet, by its influence on public opinion, or on private conduct, it has been the source of virtue and happiness to millions of the human race. The establishment of substantial Christianity, therefore, Dr. Paley deemed a matter of far greater moment than the defence of any peculiar system of religious faith. He suffered "no subordinate differences of opinion, when there was a coincidence in the main intention and object, to produce any diminution of his favour, or alienation of his esteem;" and he seemed anxious at all times, both from his writings and example, to

soften the antipathies which arise from sectarian disputes. "Every sect and modification of Christianity," he observes, "holds out the happiness and misery of another life, as depending chiefly upon the practice of virtue or vice in this; and the distinctions of virtue and vice are nearly the same in all. A person who acts under the impression of these hopes and fears, though combined with many errors and superstitions, is more likely to advance both the public happiness and his own, than one who is destitute of all expectation of a future account." "Differences of opinion," he elsewhere remarks, "when accompanied with mutual charity, which Christianity forbids to violate, are for the most part innocent, and for some purposes useful. They promote inquiry, discussion, and knowledge. They help to keep up an attention to religious subjects, and a concern about them, which might be apt to die away in the calm and silence of universal agreement."

Our space admits but a brief notice of his writings, and we must confine ourselves chiefly to those which seem to illustrate his peculiar character as an author. In 1790 Mr. Paley published his "*Horæ Paulinæ, or the Truth of the Scripture History of St. Paul Evinced, by a Comparison of the Epistles which bear his Name, with the Acts of the Apostles.*" In this, his first attempt from the press to demonstrate the authenticity of the Christian Scriptures, Mr. Paley premises that the matter contained in St. Paul's Epistles seems to exclude the possibility of forgery; since no impostor would have ventured to refer so frequently to particular circumstances, which must have exposed him to certain detection when compared with any contemporary account. Besides, the style and manner of their composition is too earnest and irregular to have originated in contrivance; and though they bear strong marks of having proceeded from the same writer, no study or care has been employed to preserve the appearance of any such consistency. From a comparison, therefore, of several indirect allusions in each of these epistles, to circumstances related in the Acts of the Apostles, or casually referred to in some other epistle, Mr. Paley derives his great argument, that, independent of all collateral testimony, their undesigned coincidence affords the strongest proof of their genuineness, and of the reality of the transactions to which they relate. The principal circumstances in the history of St. Paul being thus established, tend by a necessary inference to confirm the substantial truth of what is otherwise recorded of the founder of Christianity, and to repel some of the objections on which the adversaries of that revelation so confidently rely. This excellent treatise, though possessing perhaps more novelty of interest, and certainly more profound invention, appears to have been much less read than any other of Mr. Paley's larger works. The comparative neglect of his countrymen, however, seems not to have impeded its celebrity upon the continent, a translation in the German language having appeared in 1797 at Helmstadt, illustrated with many valuable remarks from the pen of Dr. Conrad Henke.

"The Principles of Moral and Political Philosophy," or, as it was first entitled, "The Principles of Morality and Politics," was dedicated in a very elegant address to his patron, the bishop of Carlisle. The partiality of friendship was not disappointed in the success of this excellent work, which, notwith-

standing a few objectionable passages, soon established the author's reputation. It passed through fifteen editions during his life; in which, amidst many verbal alterations, there are none which materially affect the sense. Many of Mr. Paley's positions are enforced by the most sound and convincing arguments; many of those arguments are illustrated by the most apposite examples: the intricacies of abstruse speculation are studiously accommodated to practical utility, and moral conclusions most happily applied to the incidents of common life. But he has been nowhere more fortunate in his elucidations than when contrasting the means by which so many vainly seek for happiness with those by which he invariably secured it to himself. As the government of human action is the end of all moral reasoning, it was no inconsiderable merit to render this important study interesting and intelligible to the generality of mankind. Hence Mr. Paley's labours have obtained the attention, and influenced the conduct of numbers who would have turned from former treatises on the subject with cold indifference. "Virtue," as Mr. Paley, in the words of the bishop of Carlisle, defines it, "is the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness. The 'good of mankind,' therefore, is the subject, the 'will of God,' the rule, and 'everlasting happiness,' the motive of human virtue. All obligation consists in being urged by a violent motive resulting from the command of another. As the will of God then is the rule to inquire what is his duty, or what a man is obliged to do in any instance, is, in effect, to enquire what is the will of God in that instance: which consequently becomes the whole business of morality. There are two methods of coming at the will of God on any point: by his express declarations when they are to be had, and which must be sought for in Scripture; and by what can be discovered of his designs and disposition from his works, or, as it is usually called, the light of nature. The tendency of any action to promote or diminish the general happiness is the fairest criterion for ascertaining the will of God by the light of nature; since the many proofs of benevolence apparent in the works of creation warrant the conclusion that he wills and wishes the happiness of his creatures, and that those actions are agreeable to him, or the contrary, which promote or frustrate that effect. Actions in the abstract, then, are right or wrong according to their tendency. Whatever is expedient is right. It is the utility of any moral rule alone that constitutes the obligation of it. The expediency of any action, however, must be estimated by general rules, and in reference to all its remote and collateral consequences as well as to those which are immediate and direct. Right and obligation are reciprocal; for, wherever there is a right in one person, there must be a corresponding obligation upon others. Now, because moral obligation depends upon the will of God, right, which is correlative to it, must depend upon the same. Right, therefore, signifies consistency with the will of God."

Such are the outlines of a theory which Mr. Paley has very ably and perspicuously unfolded, and applied to the solution of the various difficulties which may be expected to occur in the moral reasoning or conduct of an inhabitant of this country in the present age; for he "has examined no doubts, discussed no obscurities, encountered no errors, and

adverted to no controversies, but such as he had seen actually to exist."

Paley's "Natural Theology" is a work replete with proofs of the greatness and goodness of the Creator. It is philosophy in the highest and noblest sense; scientific, without the jargon of science; profound, but so clear that its depth is disguised. Speculations which will convince, if aught will, that "in the beginning God created the heaven and the earth," are made familiar as household words. They are brought home to the experience of every man, the most ordinary observer on the facts of nature with which he is daily conversant. A thicker clothing, for instance, is provided in winter for that tribe of animals which are covered with fur. The curious contrivance in the bones of birds, to unite strength with lightness, is noticed. The bore is larger, in proportion to the weight of the bone, than in other animals; it is nearly empty; the substance of the bone itself is of a closer texture. For these facts, some persons would quote Sir Everard Home, or Professor Cuvier, by way of giving a sort of philosophical eclat to the affair, and throwing a little learned dust in the eyes of the public. Paley, however, advises you to make your own observations when you happen to be engaged in the scientific operation of picking the leg or wing of a chicken. The very singular correspondence between the two sides of any animal, the right hand answering to the left, and so on, is touched upon, as a proof of a contriving Creator, and a very striking one it is.

The circulation of the blood, and the provision for its getting from the heart to the extremities, and back again, affords a singular demonstration of the Maker of the body being an admirable Master both of mechanics and hydrostatics, and how simple the illustration. "The aorta of a whale is larger in the bore than the main-pipe of the water-works at London Bridge; and the roaring in the passage through that pipe is inferior, in impetus and velocity, to the blood gushing from the whale's heart." Paley cares not whence he fetches the illustrations, provided they are to the purpose. The laminae of the feathers of birds are kept together by teeth that hook into one-another, "as a latch enters into the catch and fastens a door." The eyes of the mole are protected by being very small, and buried deep in a cushion of skin, so that the apertures leading to them are like pin-holes in a piece of velvet, scarcely pervious to loose particles of earth. The snail, without wings, feet, or thread, adheres to a stalk by a provision of sticking-plaster. The lobster, as he grows, is furnished with a way of uncasing himself of his buckler, and drawing his legs out of his boots when they become too small for him.

In this unambitious manner does Paley prosecute his high theme, drawing, as it were, philosophy from the clouds. But it is not merely the fund of entertaining knowledge which the "Natural Theology" contains, or the admirable address displayed in the adaptation of it, which fits it for working conviction; the "sunshine of the breast," the cheerful spirit with which its benevolent author goes on his way, this it is that carries the coldest reader captive, and constrains him to confess within himself, and even in spite of himself, "it is good for me to be here." Voltaire may send his hero about the world to spy out its morbid anatomy with a fiendish satisfaction, and those may follow him on his nauseous errand who will, but give us the feelings of the man who

could pour forth his spirit in such language as this—"It is a happy world after all; the air, the earth, the water, teem with delighted existence. In a spring noon, or a summer's evening, on whichever side I turn my eyes, myriads of happy beings crowd upon my view. 'The insect youth are on the wing.' Swarms of new-born flies are trying their pinions in the air. Their sportive motions, their wanton mazes, their gratuitous activity, their continual change of place, without use or purpose, testify their joy, and the exultation they feel in their lately discovered faculties."

This is a delightful temper of mind. When Bernard Gilpin was summoned up to London to give an account of himself and his creed before Bonner, he chanced to break his leg on the way; and on some persons retorting upon him a favourite saying of his own, "that nothing happens to us but what is intended for our good," and asking him whether it was for his good that he had broken his leg,—he answered, "that he made no question but it was." And so it turned out, for before he was able to travel again Queen Mary died, and he was set at liberty. But the extent to which this wholesome disposition is cultivated by Paley is quite characteristic of him. We mourn over the leaves of our peaches and plum trees, as they wither under a blight. What does Paley see in this? A legion of animated beings (for such is a blight) claiming their portion of the bounty of nature, and made happy by our comparatively trifling privation. We are tortured by bodily pain,—Paley himself was so, even at the moment that he was thus nobly vindicating God's wisdom and ways. What of that? Pain is not the object of contrivance—no anatomist ever dreamt of explaining any organ of the body on the principle of the thumb screw; it is itself productive of good; it is seldom both violent and long continued; and then its pauses and intermissions become positive pleasures. "It has the power of shedding a satisfaction over intervals of ease, which I believe," says this true philosopher, "few enjoyments exceed." The returns of an hospital in his neighbourhood lie before him. Does he conjure up the images of Milton's lazar-house, and sicken at the spectacle of human suffering? No—he finds the admitted, 6,420—the dead, 234—the cured, 5,476; his eye settles upon the last, and he is content. Surely the book of nature thus read is not lightly to be thrown away, wherein is written, in the plainest characters, the existence of a God, which revelation, it should be remembered, takes for granted,—of a God how full of contrivance! how fertile in expedients! how benevolent in his ends! At work everywhere, everywhere too, with equal diligence, leaving nothing incomplete, finishing "the hinge in the wing of an ear-wig" as perfectly as if it were all He had to do—unconfounded by the multiplicity of objects, undistracted by their dispersion, unwearied by their incessant demands on him, fresh as on that day when the morning-stars first sang together, and all His sons shouted for joy!

We must not omit to state that there is an interesting life of Paley by Mr. Meadley, and that a collective edition of his works were published in 1805 by the Rev. Edmund Paley. The latter contains an account of his life and writings.

PALLAS, PETER SIMON, a learned German writer, who was born at Berlin in 1741. After completing his education he settled at the Hague, and

devoted his attention to the study of natural history. While there he published several works relating to zoology. He subsequently went to Russia, where he was employed to conduct an expedition of discovery in the Asiatic provinces of that country. This and similar expeditions occupied several years, and as a reward the empress bestowed on him an estate in the Crimea. His death took place in 1811. He was the author of a number of valuable works, nearly all of which relate to natural history.

PALLADIO, ANDREA, a celebrated architect, who was born at Vicenza, in Italy, in 1518. He devoted himself at first to sculpture, but the celebrated Trissino, perceiving his inclination for mathematical studies, explained to him the architecture of Vitruvius, and took him to Rome. Here he studied, and sketched with a noble enthusiasm, the numerous monuments of ancient art; and his work on the antiquities of Rome, although imperfect in some respects, proves how thoroughly he was imbued with the chaste and classical spirit of antiquity. His work on architecture is highly esteemed. Palladio was the most distinguished of the intellectual architects who, in the sixteenth century by the study of ancient Roman and Grecian models, introduced a new and brilliant era in the art. Among the many classical edifices that were erected from the designs of Palladio and under his superintendence, the Olympic theatre at Vicenza, modelled after the ruins and descriptions of the ancient theatres in Italy, is the most striking proof of his true feeling for the antique. Unfortunately for posterity it is a mere model, composed of wood and stucco. Venice, also, was indebted to him for many of her finest structures; among which are the refectory of San Giorgio Maggiore, the church of the same name, and that called *Il Redemptore*, so deservedly celebrated for harmony of proportions and chaste simplicity of decoration. At Mestre, in the marquisate of Treviso, the splendid palace of Barbaro was his work;—Udine, Feltre, Padua, and their environs, exhibit many noble monuments of his art. Palladio, when left to his own impulses, never departed from the noble and majestic simplicity of the ancients, for which reason Algarotti called him the Raphael of architecture. He maintained the peculiar character of the different orders, and always knew how to give at least an agreeable appearance to his façades, although often obliged to apply a classical front to an old house, very ill suited for his purpose. He had a peculiar taste and talent for pyramidal forms, and applied the pilaster or angular column with masterly effect. In profiles too he was pre-eminent, and his structures in this respect are faultless. Many of his works are not without imperfections, but they may generally be charged to the inability of those who were employed to execute his designs. It was, perhaps, in too strict imitation of the antique that he always placed pedestals beneath his columns, and applied pillars of different elevations to the same design. He was also too prone to load his doors and windows with architectural ornament.

Palladio died in 1580, highly esteemed by his countrymen, and especially in the States of Venice, where he enjoyed the appointment of architect to the republic. A memoir of his life was written by Tommaso Remanza, and published at Venice, in quarto, 1762. All his works have been republished at Paris since 1829, in twenty successive folio numbers, with plates and remarks, by Chapuy and Beugnot.

PALMA, a Neapolitan composer, who was a pupil of the celebrated Sala. Immediately on the completion of his musical education, he wrote several theatrical dramas at Naples and in the rest of Italy; all of which were successful from their gay and piquant style. He was an excellent pianist and tenor singer, but from his dissipation quickly exhausted the income which he derived from the different branches of his profession.

PALMER, JOHN.—This gentleman was the first projector of mail-coaches. He was a native of the city of Bath, where he was brought up as a brewer; but subsequently solicited and obtained a patent for a theatre in his native town. To keep up his stock of actors, Mr. Palmer paid an annual visit to most of the provincial companies in the kingdom, and also about the same time obtained a patent for the Bristol theatre, from which, on account of its immediate vicinity to his native city, he derived many great advantages.

Having now brought both his theatres into vogue, and rendered them highly beneficial, he at length determined, after the death of his father, to dispose of the property of his family in them. Accordingly an agreement was entered into with Mr. Dimond, an actor reared under his own auspices, and Mr. Keasbury; and to these he disposed of the patents on terms highly advantageous to all parties.

We have now arrived at that epoch when Mr. Palmer became connected with one of the principal public offices in the state, and his plans and pursuits ultimately blended with the commercial and manufacturing interests of the nation. The post at this period was so slow, and even so uncertain in its deliveries, that expresses were often substituted by commercial men; the roads too were bad, and the danger of robbery imminent.

Mr. Palmer's long and circuitous journeys on theatrical affairs had made him have frequent recourse to relays when pressed for time; and he perceived, by long experience, that he could easily anticipate the delivery of a letter by the usual conveyance. This, doubtless, suggested the idea that what could be done for an individual might, with equal ease and still greater benefit, be effected for the public at large. It was not, however, until he had traversed the whole kingdom almost in every possible direction, and made himself acquainted with all the impediments and all the abuses in the post-office department, that he deemed his projects sufficiently concocted and complete. Accordingly, in 1782 or 1783, he applied to the lords commissioners of the treasury by means of a memorial, in which he stated all his plans with great minuteness and precision, and forgot not to add, that their execution would be attended not only with great advantage to commercial men, but produce an immediate increase of the revenue. Mr. Pitt, then minister, was busily employed at this very moment in devising means for rescuing the country from those pecuniary difficulties which had been entailed in consequence of the prosecution of the American war; by him, therefore, this proposition, fraught with increasing revenue and many public advantages, was received with due attention. On this Mr. Palmer removed with his family to town, and a successful termination, as it was then hoped, had now taken place in respect to all his negotiations with the superior powers. But the manner in which this was effected proved inefficient; and, strange to tell, in a matter of such importance no

written agreement had ever been entered into. A verbal one, indeed, took place with the premier, but even that happened to be through the intermediate agency of a third person. Mr. Palmer stated, when examined before a committee of the house of commons, that he left some papers with Dr. Prettyman, stating, that "if my plan succeeded for the reform and improvement of the posts, I demanded for my life two and a half per cent. on the future increased revenue of post-office beyond the present nett profits, and not to have one shilling if I did not succeed in my plan. This happened in the spring of 1784. The answer brought to me by Dr. Prettyman was, that the terms were thought fair, and would be fully complied with provided the plan succeeded."

Mr. Palmer accordingly commenced his operations, and actually effected a considerable saving above the original estimate of 20,000*l.* in the contract for the mails. It was deemed convenient soon after, however, to modify the first agreement, in consequence of which it was finally settled that Mr. Palmer was entitled to 1500*l.* a year, and a per centage for the nett revenue exceeding 240,000*l.* per annum. The scheme succeeded far beyond expectation, and was praised by every one but the postmasters-general and their immediate dependants. According to them it was highly injurious both to the mercantile interest and the public revenue; and it would appear that some of them were in consequence so scrupulously conscientious as actually to oppose the full and entire execution of the project.

In the spring of 1785 Mr. Palmer addressed a letter to the premier complaining of the conduct of Mr. Todd, the secretary, and also of the interior mismanagement of the office committed to his charge. "The success of the plan, Sir, I believe," adds he, "has exceeded both yours and the public's expectation. I am sure it has my own in some points, though not in others, but has not fallen short in one; a circumstance, I believe, almost as new to administration in the various plans that are submitted to them as a popular tax, which the post-tax really is, where the accommodation has been given with it. It incurred no new expense or inconvenience in the old establishment even in the trial, but what was occasioned by the opposition from the general office. It conveys the mails in half the time they used to be, and guarded under regulations that will in a great measure enforce themselves; and where it has been carried into execution has immediately occasioned an increase of revenue to the post-office. It having been proved that it is scarce possible for greater neglect or abuses to prevail than in the conduct of the old post,—that in consequence of it a great share of the correspondence was carried on by coaches to the detriment of the post revenue,—that the new tax, coupled with the old plan, would have increased such defalcation, which, by the statements given in to the treasury, comparing the great improvement in the revenue from the tax upon the new opposed to the old establishment, has been very fully proved. It was promised in the plan to give the improved expedition and security to the great roads from London, and some of the cross roads, for the payment of three-pence per mile, the allowance for guards, and the exemption from turnpike tolls. The contracts are now made for the greater part of the kingdom for the allowance of guards and the exemption for turnpike tolls only; likewise, for all the cross posts, six times a week instead of three, so as to

make those posts as regular and perfect as the general one.

"This accommodation will be given to the public, and the arrival and departure of the mails all over the country will now be regular, expeditious, and safe, on plain, certain, and simple principles, instead of the reverse. It will not only save many thousands a-year in the expense of the riding work, &c., but, in consequence of the superior mode of conveyance to any other, add greatly to the revenue by the increase of correspondence through the post-office. In the progress of the business I have had *every possible opposition from the office*; I have neither spared trouble nor expense to inform myself in every department of it, so that I may carry my plan completely into execution, and defeat their repeated attempts to ruin it. I have been perfectly open, and kept no one secret from government, or desired one shilling advantage from any contract, but acted in every respect to the best of my judgment for the benefit of the public; nor can I gain the least advantage from my agreement till I have completed the plan over the whole kingdom, as my per centage from the increased revenue by the tax, without the accommodation, will not pay the very great expenses I am obliged to incur in the establishing it."

As many conflicting interests seemed to oppose the full and complete establishment of Mr. Palmer's plan, and as it was supposed likely to affect the perquisites of a variety of persons from the lowest to the highest in that department, Mr. Pitt, actuated solely by a regard for the public good, wished to render Mr. Palmer completely independent of the post-office. With this view the draft of a commission was made out, constituting and appointing him, for and during his life, surveyor and comptroller-general of the general post-office of Great Britain, with all its postmasters, contractors, deputies, accomptants, surveyors, clerks, sorters, window-men, &c., &c., with the power of suspending all such for the neglect of duty. On being laid before the attorney-general, it was suggested that such extraordinary powers were incompatible with the act of parliament for regulating the office of postmaster-general. This objection on the part of a great officer of the crown impeded the proposed appointment for almost a year; but Mr. Palmer was at length invested with the office, on an understanding that he should be under the controul of the treasury alone, and thus derive his powers from the same source and authority as the postmasters-general themselves.

Soon after this a violent dispute took place, in consequence of which Mr. Palmer suspended his deputy, who, it appears, communicated a series of papers to the postmasters-general, who had been much blamed by Mr. Palmer for their negligence, and thus rendered the breach with them irreparable. Their lordships immediately took the case of Mr. Bonner into consideration, and ordered him to be restored; but the comptroller-general refused the key of the office to the applicant himself; and although he delivered it up, on a second application, to the solicitor of the post-office, yet he himself was in his turn suspended! Thus the success of all his schemes was put in jeopardy, the new improvements in the posts retarded, his prospect of future remuneration hazarded, and his whole fortune placed in a state of the utmost uncertainty. He had risked his all; for, by an express contract with government, he was pre-

cluded from reaping any advantage in case of failure, and had actually advanced several thousand pounds out of his own capital. Under his management the revenue had risen from 150,000*l.* in 1783 to 600,000*l.* in 1798; not a single mail robbery had occurred, and yet his remuneration was now absolutely fixed at 3000*l.* a year. On this Mr. Palmer took the opinion of eminent counsel; but, although this was entirely in his favour, yet it was found impossible to commence a suit at law against the government with any probability of success. Anterior to this he had petitioned the treasury board, to which he received for answer, "that their lordships conceived 3000*l.* per annum for his life a sufficient compensation for his services; and that they did not think themselves justified, on the part of the public, in making a farther allowance." On this, in 1797, Mr. Palmer applied by petition to the house of commons, and a committee was nominated to report on the causes of his suspension, and also on the nature of his agreement. Mr. Pierrepont, in a very able speech, pointed out the merits and success of Mr. Palmer's plan, which was attended with this peculiarity, that in case of failure he was to receive no pecuniary indemnification and no reimbursement for his expences. During the forty years preceding his intervention, notwithstanding the great increase of trade and manufactures, the nett revenue of the post-office had experienced no increase whatever, except what was necessarily derived by the enhancement of the rate of postage and restriction of franks; on the contrary, indeed, taking an average of the nine years preceding the new plan, it had actually experienced a decrease of 13,198*l.* 13*s.* per annum. After the first gleam of success, the projector was obliged to submit to a new agreement, by which he lost 750*l.* per annum, but this was to be followed by every possible facility in the furtherance of his ultimate designs. And yet the commissioners appointed by the house of commons to enquire into this very subject, reported that Mr. Palmer had experienced "opposition from the oldest and ablest officers in the service, who represented his plan not only to be impracticable, but dangerous to commerce and the revenue;" and it was nevertheless added, "that he has exceeded the expectations which he held forth in his first proposal, both with regard to despatch and expense." They further state that the country has derived great advantage by the new scheme, while the post-office revenue had increased, since 1783, to the amount of nearly half a million!

Mr. Sheridan on this occasion supported the pretensions of the claimant in a very brilliant speech, in the course of which he expressed himself as follows: "None but an enthusiast could have imagined or formed such a plan; none but an enthusiast could have made such an agreement; none but an enthusiast could have carried it into execution: and I am confident," adds he, "that no man in this country, or any other, could have performed such an undertaking, but that very individual John Palmer." Dr. Lawrence also observed in the course of a very energetic harangue, which, like the former, proved ineffectual, "That it was to be apprehended, from what he heard and what he knew, that men of talents, who might hereafter be willing to employ their genius and their industry in the service of the public, would discover that Mr. Palmer had one fault greater than any which had been pressed against him. This was

the fault of an over-hasty and improvident zeal, to do, without regard to his own interests, whatever good it was in his power to achieve for his country." Nor ought it to be here omitted that the joint post-masters-general, with whom he had many disputes and contentions, on being required to deliver their opinion as to his motives, readily exhibited the most ample testimony on behalf of his character and integrity.

At length Mr. Palmer, after an interval of some years, determined, undismayed by his former defeat, to apply once more to parliament for redress; and it must be allowed that he never displayed greater perseverance and abilities than upon this occasion. He had taken care to make his pretensions known from one end of the kingdom to another; he canvassed almost every member of parliament, either by himself or others, and as his cause was good and his friends full of enthusiasm, the best founded hopes were entertained of success. His eldest son, Major Palmer, who had succeeded him as M. P. for Bath, was entrusted with the management of this delicate and interesting business. Accordingly, on May 12, 1808, in a committee of the whole house, after a short introductory speech, it was moved by him, "That this house is of opinion that Mr. Palmer is entitled to 2*l.* 10*s.* per cent. on the nett revenue of the post-office, exceeding the sum of 240,000*l.*, to be paid up from the 5th of April, 1793, and during his life, according to the provisions of his appointment of 1789; deducting the sum of 3000*l.* a year, received subsequently to the 5th of April, 1793." This proposition was opposed by Messrs. Long and Rose, the chancellor of the exchequer and the attorney-general; but supported by Lord Henry Petty, Sir Francis Burdett, Mr. Windham, &c.; and after a long debate carried against ministers by a majority of eighty-six. In a committee of supply, leave was soon after given to bring in a bill to secure to the subject of this memoir the benefits of the late vote; and it was soon after moved and carried, "That a sum not exceeding 54,702*l.* 0*s.* 7*d.* be granted to his majesty, to be paid to John Palmer, Esq., being the balance of the percentage due to him on the nett revenue of the post-office, from the 5th of April, 1793, to the 5th of January, 1808."

The house of lords, having by its votes and proceedings, exhibited a certain degree of hostility to Mr. Palmer's claim, it was now determined by his friends not to bring in a separate act for remuneration. On the contrary, the business was completely effected by introducing a distinct clause for this purpose in the "Appropriation Bill," which precluded the possibility of a negative from the other chamber of parliament. A very large claim had been made for arrears, but it was deemed impolitic to urge this in the present state of public affairs. After this final decision, by which 54,702*l.* was secured to Mr. Palmer, his mind appears to have been entirely at rest concerning pecuniary matters. Certain it is that he had lost a very considerable sum under the head already alluded to, which many supposed that he was to the full as much entitled to as to the money which had been voted; but on the other hand, his per centage, which he still retained, became daily more productive, and as he lived about eleven years in the enjoyment of it, his reward must, on the whole, have proved very handsome. At length, amidst every prospect of the future happiness of his family, he

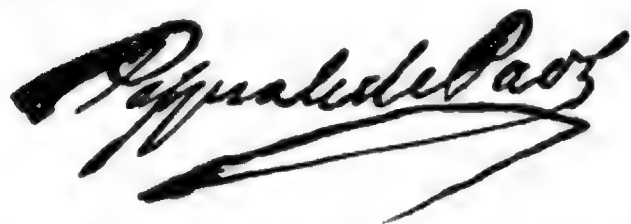

died at Brighton in 1818, in the seventy-sixth year of his age.

**PALMER, JOHN**, a dissenting minister, who was born in Southwark, and educated for the church. In 1759 he obtained a congregation in New Broad Street, and although brought up as a Calvinist he finally became a unitarian. Having married a lady of fortune he retired from his duties, and lived privately till his death, which took place in 1790. He was the author of several works, one of which entitled "Free Thoughts on the Inconsistency of conforming to any Religious Test, as a Condition of Toleration," is considered the best.

**PALSGRAVE, JOHN**, a learned English grammarian and divine, who was born in London, but received the principal part of his education in Paris, where he became celebrated for his learning and literary attainments. Having been employed by the French court to instruct the queen, who was the sister of Henry VIII., in the language of her adopted country, he actually compiled "A Grammar of the French Language," and, what is still more remarkable, he accompanied it with many important instructions with regard to correct pronunciation. He subsequently returned to England, where he died in 1554.

**PAOLI, PASCAL**, a Corsican officer of distinction, who was born in 1725. While employed in his studies at Genoa, his countrymen sent him an invitation to return and become their chief in an intended insurrection against the Genoese. All his efforts, however, in the cause of his country failed, and he was at last obliged to make a hasty flight to this country, where he was received with every mark of distinction, and a handsome pension allowed him. On the breaking out of the French revolution he went back and became commander-in-chief of the island of Corsica; and through his influence a decree was passed, which separated Corsica from France and annexed it to Great Britain. Paoli subsequently returned to England, and had his pension restored to him.

Paoli died in February 1807, and a bust was placed in Westminster Abbey, with the following inscription beneath:—"To the memory of Pasquale de Paoli, one of the most eminent and most illustrious characters of the age in which he lived. He was born at Roslino, in Corsica, April 5th, 1725; was unanimously chosen, at the age of thirty, supreme head of that island, and died in this metropolis, February 5th, 1807, aged eighty-two years. The early and better part of his life he devoted to the cause of liberty, nobly maintaining it against the usurpation of Genoese and French tyranny, by his many splendid achievements, his useful and benevolent institutions, his patriotic and public zeal, manifested upon every occasion. He, amongst the few who have merited so glorious a title, most justly deserves to be hailed the father of his country. Being obliged, by the superior force of his enemies, to retire from Corsica, he sought

refuge in this land of liberty, and was here most graciously received, amidst the general applause of a magnanimous nation, into the protection of his majesty, King George III., by whose fostering hand and munificence, he not only obtained a safe and honourable asylum, but was enabled, during the remainder of his days, to enjoy the society of his friends and faithful followers, in affluent and dignified retirement. He expressed, to the last moment of his life, the most grateful sense of his majesty's paternal goodness towards him, praying for the preservation of his most sacred person and the prosperity of his dominions."

**PAPIN, DENYS**, a French philosopher, who was born at Blois, in France, and having completed his studies came to this country, where he was made a fellow of the royal society. He distinguished himself by his investigations respecting the power of steam; but is best known for an invention of his own called, "Papin's Digester," of which a description was published under the title of "The New Digester, or Engine for the Softening of Bones." He was also the author of "Fasciculus Dissertationum de quibusdam Machinis Physicis." M. Papin died in 1694.

**PARK, JOHN JAMES**, an English lawyer, who was professor of law and jurisprudence at King's college, London. He early in life distinguished himself by his literary attainments, and before he was of age published "The Topography and Natural History of Hampstead." His next publication was a tract on tithes, which was considered to evince some original and just notions on that subject. This was followed in 1819 by "A Treatise on the Law of Dower, with a View to the Modern Practice of Conveyancing." His "Contre Projet to the Humphrysian Code, and to the Projects of Redaction by Messrs. Hammond, Uniacke, and Twiss," bears the date of 1828. In 1830 he published three juridical letters, under the name of "Eunomos," addressed to the right honourable Robert Peel, in reference to the crisis of law reform. In order of time we may next mention the honourable but not very lucrative appointment of Mr. Park, as the professor of law and jurisprudence at King's college, London. This took place in 1813.

It was the question of the expediency of a code which first induced Mr. Park to look into the foreign systems of jurisprudence; a branch of study which he afterwards pursued with a zeal that led him to make those exertions which shortened his valuable life. His reading was very extensive; indeed there is scarcely a modern jurisconsult in this country whose writings contain such apt and copious illustrations, drawn from sciences unconnected with the law. He was all his life a reformer, legal and political; but his reforms were based upon principles so little understood, that with many he passed as an advocate for preserving unchanged the existing systems.

In March 1832 (according to the date of his preface), he published his "Dogmas of the Constitution." The following passages show the opinions of the professor on the political movements of the age, and afford a fair specimen of his peculiar habits of thinking and style of expression:—

"It will be seen from the following pages that the writer is neither Whig nor Tory—that neither 'Reformer nor Anti-reformer' would define his school of politics,—but that he is a disciple, or promoter,

whichever the reader may choose, of the nascent school of inductive politics, or observational political science; a science which,—leaving on the right hand and on the left all conventional principles which have hitherto been accredited, to be ultimately adopted or rejected, as scientific judgment and resolution alone shall decide,—seeks first, and above all things, to elevate the vague and notional element of political philosophy to the rank of certain sciences; or, as they are felicitously denominated by French authors, “*les sciences d’observation*.” His business he represents to himself to be, not to reject or idolize the wisdom of his ancestors, but to stand upon their shoulders and try how much further he can see. Wedded to no party in politics, and having nothing to seek from any; abominating from the very bottom of his heart the politics of irresponsible power, and having waged as implacable a war with those politics as ever private individual did wage during the whole course of Lord Castlereagh’s administration; he has given ample security to those who know him that despotism never shall enlist him under her banners; and if any of them should suspect that his sentiments on the present subject are influenced by his connexion with the institution in which they are delivered, he will make no other reply to such a supposition, than by the insertion below of an extract from a confidential letter written to a private friend and most zealous advocate of the Reform Bill, in November 1830, when his connexion with that institution had not commenced, even in name. In this letter he remarked:—“These are not times for the mind to rust in; and on many subjects my perceptions have advanced a whole age within a few years. But my anxiety increases with my power of sight. My heart was never more earnestly devoted to the cause of reform, but my confidence in its accredited means is gone. Names have no longer a spell for me. Reform in parliament is to me nothing more than the exchange of one system for another; removing along with the present system its own evils, over taxation and prostitution of patronage; exchanging them for the jeopardy, still more critical, of an abject government, uncondemned any longer by the power of a few gigantic and dedicated minds.” This gentleman died in 1833 at the early age of thirty-eight.

PALMER, JOHN, an eminent English actor, who was born in London in 1742, and made his first appearance under Foote’s management at the Haymarket; and after having performed with reputation in the country, he was engaged by Garrick at Drury Lane. He subsequently gave up his engagement at the Haymarket and went to Liverpool, where he became a great favourite; but his dissipated character being known, as well as the ill treatment endured by his wife, whom he had left in London, the whole town resolved to absent themselves from his benefit. Alarmed at such a loss, he posted to London, prevailed upon his wife to accompany him back to Liverpool, and they walked together in a public walk on the following Sunday; which so completely refuted the report in the public opinion that his benefit was crowded and lucrative. In the winter seasons he continued progressively advancing at Drury Lane theatre, and in the summer he performed sometimes at Liverpool, Dublin, and Birmingham, until he was finally engaged at the Haymarket. Soon after Messrs. Sheridan, Ford, and Linley, became proprietors of the winter house, an accident happened to Mr. Palmer

which had nearly proved fatal. At the close of the “Grecian Daughter,” when the heroine stabs the tyrant, a part which Mr. Palmer sustained, he received a severe blow from Mrs. Barry, owing to the failure of the spring in the dagger. This circumstance confined him to his bed five months, during which time he was frequently amused with reading accounts of his own death in the newspapers, and great panegyrics on his theatrical abilities. In 1785 Mr. Palmer formed the design of building a theatre near Wellclose Square, in which he supposed himself authorized to perform plays under sanction of the governor of the Tower, it being in that district. The theatre was finished, and opened in the summer of 1787, with “As you like it,” and “Miss in her Teens;” but the managers of the theatres royal, considering this as an invasion of their property, took every means to suppress it, and were finally successful.

This contest between the theatres royal and the Royalty theatre produced much invective and a long paper war; in which Mr. Palmer was obliged to yield, though supported by many gentlemen of fortune. When he found he could not play at the Royalty theatre, he performed at Worcester and other parts of the country, and afterwards at the Haymarket and Drury Lane.

The expenses incurred at the Royalty theatre, united to those consequent on his own love of pleasure, had involved him in considerable debts, for which he suffered a long confinement in the King’s Bench prison. In term time he gave a miscellaneous entertainment near Covent Garden, and as the Surrey theatre is in the rules of the King’s Bench, he performed there, and was the manager at 27*l.* per week, which enabled him to support his family with ease and splendour.

Notwithstanding he lived in affluence during a part of the year, yet confinement to one spot became irksome. He therefore proposed to his creditors, as the condition of his liberation, to allow a certain sum annually, to be deducted from his salary, for the liquidation of his debts. This was accepted, and we understand he punctually performed his engagement to the last hour of his life. He was afterwards restored to his former honours at Drury Lane and the Haymarket, where he performed again with undiminished reputation.

Mr. Palmer’s last engagement was at Liverpool. On the 2nd of August, 1798, he appeared in the character of “The Stranger,” and in the two first acts exerted himself with great effect: in the third he displayed evident marks of depression, and as he was about to reply to the question of Baron Steinfort, relative to his children, he appeared unusually agitated. He endeavoured to proceed, but his feelings evidently overcame him; the hand of death arrested his progress, and he instantly fell upon his back, heaved a convulsive sigh, and instantly expired without a groan. The audience supposed for the moment that his fall was nothing more than a studied addition to the part, but on seeing him carried off in deadly stiffness, the utmost astonishment and terror became depicted in every countenance. Medical assistance was immediately procured; his veins were opened, and every other means of resuscitation were had recourse to without effect. The manager came on the stage to announce the melancholy event to the audience; but so completely overcome with grief as to

be incapable of uttering a sentence, and was at length forced to retire without being able to make himself understood.

Mr. Palmer was a most affectionate father, and many of the embarrassments under which he laboured arose from the excess of parental fondness. His remains were followed to the grave on the 6th of August, 1790, by the principal performers of the Liverpool theatre. A stone was placed at the head of the grave with the following lines inscribed, which were the last words he spoke, in the character of "The Stranger"—

"Oh! God! God!"

There is *another* and a *better* world!"

PARK, MUNGO.—This enterprising traveller was born at Selkirk, in Scotland, in September 1771, and was educated for the medical profession. Having served his time to a surgeon he came to London and obtained a post as assistant-surgeon on board an East Indiaman. During his voyage, and while the vessel was waiting for a cargo, he made some botanical collections, of which he published an account in "The Transactions of the Royal Society." Returning to England he engaged in an expedition to the interior of Africa, for the purpose of discovering the source of the river Niger. He arrived on the coasts of Senegal in June 1797, and having made himself acquainted with the Mandingo language he commenced his journey, in the course of which he encountered great dangers; in spite of which, however, he prosecuted his undertaking till he had reached the banks of a large river, which appeared to be the object of his researches. The state of destitution, however, to which he was reduced rendered it impossible for him to proceed; he therefore made his way towards the coast, and arrived in England in 1797. Of his discoveries he published a very interesting account, and from his "Travels in the Interior of Africa" we subjoin the following extract; it relates to his captivity at Benown. Having been conducted to the royal tent, he says, "we found a great number of men and women assembled. Ali was sitting upon a black leathern cushion clipping a few hairs from his upper lip, a female attendant holding up a glass before him. He appeared an old man of the Arab cast, with a long white beard, and he had a sullen and indignant aspect. He surveyed me with attention, inquiring of the Moors if I could speak Arabic, and being answered in the negative, seemed much surprised, and continued silent. The surrounding attendants, and especially the ladies, were abundantly more inquisitive; they asked a thousand questions, inspected every part of my apparel, searching my pockets, and obliged me to unbutton my waistcoat and display the whiteness of my skin; they even counted my toes and fingers, as if they doubted whether I was in truth a human being. In a little time the priest announced evening prayers; but before the people departed the Moor, who had acted as interpreter, informed me that Ali was about to present me with something to eat, when, looking round, I observed some boys bringing a wild hog, which they tied to one of the tent strings, and Ali made signs to me to kill and dress it for supper. Though I was hungry I did not think it prudent to eat any part of an animal so much detested by the Moors, and therefore told him that I never ate such food. They then untied the hog in hopes that he would immediately run at me, for they believe that a great enmity subsists between hogs and Christians; but in this they

were disappointed, for the animal no sooner gained his liberty than he began to attack, indiscriminately, every person that came in his way, and at last took shelter under the king's couch. It is sufficient to observe, that the rudeness, ferocity, and fanaticism which distinguished the Moors from the rest of mankind, found here a proper subject whereon to exercise their propensities.

"I was a stranger, I was unprotected, and I was a Christian; each of these circumstances is enough to drive every spark of humanity from the heart of a Moor; but when all of them, as in my case, were combined in the same person, and a suspicion prevailed withal that I had come as a spy into the country, the reader will easily imagine I had every thing in my situation to fear. Anxious, however, to conciliate favour, and, if possible, to afford the Moors no pretence for ill-treating me, I readily complied with every demand, and patiently bore every insult; but never did any period of my life pass so heavily away; from sun-rise to sun-set I was obliged to suffer, with an unruffled countenance, the insults of the rudest savages on earth. The Moors, though very indolent themselves, are rigid task-masters, and keep every person under them in full employment. My boy, Demba, was sent to the woods to collect grass for Ali's horses; and after a variety of projects concerning myself, they at last found out an employment for me; this was no other than the respectable office of barber. I was to make my first exhibition in this capacity in the royal presence, and to be honoured with the task of shaving the head of the young prince of Ludamur. I accordingly seated myself upon the sand, and the boy, with some hesitation, sat down beside me. A small razor, about three inches long, was put into my hand; I unfortunately made a slight incision in the boy's head at the very commencement of the operation, upon which I was ordered to walk out of the tent. This, on reflection, I considered a fortunate circumstance; for I had laid it down as a rule to make myself as useless and insignificant as possible, as the only means of recovering my liberty.

"March 18th, four Moors arrived with Johnson, my interpreter, from Jarra, having seized him before he had received any information of my confinement. He brought with him a bundle of my clothes, which was taken with Johnson, there to undergo examina-

tion, into Ali's tent. It was fortunate that he did not bring my papers, and I was pleased to hear he had committed them to the charge of one of Daman's wives. When Ali had satisfied his curiosity, the different articles were tied up and put into a large cow-skin bag in one corner of the tent; the same evening he sent three of his people to inform me that there were many thieves about, and to prevent the rest of the things from being stolen it was necessary to convey them all into his tent. Ali thought to find a quantity of gold and amber, but being disappointed he sent the same people the next morning to examine me, and ascertain whether I had any thing concealed about my person. They stripped me and searched every place, robbing me of all my gold, amber, my watch, and one of my pocket compasses; the other I had buried in the sand, and this, with the clothes I had on, was all that the tyranny of Ali had left me. The pocket compass, when they got it in their possession, excited so much superstitious curiosity that Ali sent for me to be informed why this small piece of iron (the needle) always pointed to the great desert, and I found myself somewhat puzzled to answer the question. To have pleaded my ignorance would have created a suspicion that I concealed the truth; I therefore told him that my mother resided far beyond the sands of Zaharra, and that whilst she was alive the piece of iron would always point that way, and serve as a guide to conduct me to her, and that if she were dead it would point to her grave. Ali now looked at the compass with redoubled amazement, turning it round and round repeatedly; but observing it always pointed the same way, he took it up with great caution, and returned it to me as a magic thing he was afraid of keeping in his possession. The assembly being thus dissolved, I was conducted to the tent of Ali's chief slave, but was not permitted to enter, nor allowed to touch any thing belonging to it. When I requested something to eat they gave me a little boiled corn, with salt and water, in a wooden bowl; and a mat was then spread upon the sand before the tent, on which I was to pass the night, surrounded by a curious multitude. At sun-rise, Ali, with a few attendants, came on horseback to visit me, and signified that he had provided a hut for me, where I should be sheltered from the sun. I was accordingly conducted thither, and found the hut comparatively cool and pleasant. It was constructed of corn-stalks set up on end, in the form of a square, with a flat roof of the same materials, supported by forked sticks; to one of which was tied the wild hog before-mentioned. The animal had certainly been placed there by Ali's order out of derision to a Christian. I found it a very disagreeable inmate, as it drew together a number of boys, who amused themselves by beating it with sticks, until they had so irritated the hog that it ran and bit at every person within its reach.

"I was no sooner in this my new habitation than the Moors assembled in crowds to behold me; but I found it rather a troublesome levee, for I was obliged to take off one of my stockings and show them my foot, and even to take off my jacket and waistcoat to show them how my clothes were put on and off; they were peculiarly delighted with the curious contrivance of the buttons. All this was to be repeated to every succeeding visitor; for such as had already seen these wonders insisted on their friends seeing the same, and in this manner I was employed, dressing and un-

dressing, buttoning and unbuttoning, from noon to night. About eight o'clock Ali sent me for supper some kouskons and salt and water, which was very acceptable, being the only food I had tasted since the morning. I observed that in the night the Moors kept regular watch, and frequently looked into the hut to see if I was asleep, and if it was quite dark they would light a wisp of grass. About two o'clock in the morning a Moor entered the hut, probably to steal something, or perhaps to murder me, and groping about he laid his hand on my shoulder. As night visitors were at best but suspicious characters, I sprang up the moment he laid his hand on me; the Moor, in his haste to get off, stumbled over my boy, and fell with his face upon the wild hog, which returned the attack by biting the Moor's arm. The screams of the man alarmed the people in the king's tent, who, conjecturing that I had made my escape, mounted their horses in preparation for a pursuit. I observed, upon this occasion, that Ali did not sleep in his own tent, but came up galloping upon a white horse from a small tent at a considerable distance; indeed, the cruel and tyrannical behaviour of this man made him so jealous of every person around him, that even his own slaves and domestics knew not where he slept. When the Moors had explained to him the cause of the outcry they all went away, after which I slept quietly until morning.

"March 13th. With the returning day commenced the same round of insult and irritation; the boys assembled to beat the hog, and the men and women to plague the Christian. 'Tis impossible for me to describe the behaviour of a people who study mischief as a science, and who exult in the miseries and misfortunes of their fellow-creatures.—March 20th. A council was held this morning at Ali's tent respecting me; the chief men were all unfavourable to me. Some said they intended to put me to death, others that I was only to lose my right hand; but the most probable account was that which I received from Ali's own son, a boy about nine years of age, who came to me in the evening, and with much concern informed me his uncle had persuaded his father to put out my eyes, which they said resembled those of a cat, and that all the Bushreens had approved of this measure; his father, however, he said, would not put the sentence into execution until Fatima, the queen, who was at present in the north, had seen me.

"Anxious to know my destiny, I waited upon the king the next morning, when a number of Bushreens were assembled. I thought this a favourable opportunity of discovering their intentions; I therefore began by begging permission to return to Jarra, which was flatly refused; his wife, he said, had not yet seen me, and I must stay until she came to Be-nown, after which I should be at liberty to depart, and that my horse, which had been taken from me, should be again restored. Unsatisfactory as was this answer, I was forced to appear contented with it; and as at this season there was little chance of making my escape on account of the excessive heat, and the total want of water in the woods, I resolved to wait patiently until the rains set in, or until some more favourable opportunity should present itself;—but hope deferred maketh the heart sick. Disappointed, and thinking too much of the difficulties I should have to encounter in travelling through the negro countries in the rainy season, made me melancholy, and brought on a smart attack of fever. I wrapped

myself in my cloak with a view of inducing perspiration, and was asleep when a party of Moors entered the hut, and with their usual rudeness pulled up the cloak from me. I made signs to them that I was sick, and wished much to sleep; but I solicited in vain; my distress was sport to them, and they only annoyed me the more. This was bitterness to me, their intolerable insolence filled the cup of my captivity full to the brim with the ingredients that make life a burden. I frequently envied the situation of a slave, who, amidst all his calamities, could still possess the enjoyment of his own thoughts; a happiness to which I had for some time been a stranger. Wearied out with such continual insults, and perhaps a little peevish from the fever, I trembled lest my passion might overleap the bounds of prudence, and spur me to some sudden act of resentment, when death must have been the inevitable consequence. In this perplexity I left my hut and walked to some shady trees at a little distance from the camp, where I laid down. But even here persecution followed me; and solitude was thought too great an indulgence for a distressed Christian. Ali's son, with a number of horsemen, came galloping to the place and ordered me to rise and follow them. I begged them to allow of my remaining, if it were only for a few hours; they, however, heeded me not, and after a few threatening words one of them pulled out a pistol from a leather bag that was fastened to the pommel of his saddle, and presented it towards me, snapping it twice. He did this with so much indifference that I really doubted whether the pistol was loaded; he cocked it a third time, and was striking the flint with a piece of steel, when I begged him to desist, and returned with them to the camp. When we entered Ali's tent he called for the man's pistol, and amused himself for some time with opening and shutting the pan; at length, taking up his powder-horn, he fresh primed it; then looking round to me, said something in Arabic, which I did not understand. I desired the boy to inquire what offence I had committed; I was then informed that having gone out of the camp without permission, they suspected I contemplated my escape; and that in future if I was seen without the skirts of the camp, orders had been given that I should be shot by the first person that observed me.

"A month had now passed away in captivity, my only food being a share of a bowl of kouskons, brought at midnight, with some salt and water, for me and my two attendants; this was all that was allowed to support nature for the whole of the following day. It was the Mahomedan lent, and they made a Christian observe it; but I bore hunger and thirst better than I expected, and now began to find amusement in learning to write Arabic, and diverting the people from teasing by engaging their attention in teaching me.—April 14th. Ali went to fetch his wife, which was two days' journey. In order to provide for this a fine bullock was killed, and the flesh being cut into thin slices was dried in the sun; and this, with two bags of kouskons, formed his travelling provision. After the departure of Ali a sheereef arrived with salt: as there was no tent provided for him he took up his abode in my hut. He was a well informed man, and his knowledge of languages enabled him to pass in safety through a number of kingdoms. Shortly afterwards several sheereefs arrived, one of which, having resided at Gibraltar, spoke

a little English. In conversing with these I passed my time with rather less uneasiness than formerly. On the other hand, I now found myself worse supplied with food than during the fast; I was wholly dependent on Ali's slaves, and they neglected me for two successive nights. I sent my boy to a small negro town near the camp, where he begged with diligence from hut to hut, but could only get a few handfuls of ground nuts, which he readily shared with me. The whole country was thrown in confusion by the approach of an army hostile to Ali. The tents were struck, the cattle were driven away, and the baggage placed on the backs of the bullocks, over which the tent cloth was thrown, and the women, who rode, sat above the whole. The king's favourite concubines rode upon camels, with a canopy to shelter them from the sun. The hurry and confusion which attended the decampment made this day one of fasting to me; there had been no victuals dressed, therefore I could have none. The next day I begged in a negro town, and was liberally supplied. On the 3rd I was introduced to the queen; she appeared at first shocked at having a Christian so near her: she however gave me a bowl of milk. The country now presented a dreary expanse of sand; the weather was hot and there was a great scarcity of water. Day and night the wells were crowded with cattle, lowing and fighting with each other to come at the trough; excessive thirst made them furious; some endeavoured to allay their thirst by devouring the black mud from the gutters near the well; which they did with avidity, though it was commonly fatal to them. I had a skin, but if my boy attempted to draw water from a well he got a drubbing for his presumption. Every one was astonished that a Christian slave should attempt to draw water from wells dug by the followers of Mahomet.

"One afternoon as I was tending my horse in the fields, Ali's chief slave and four Moors arrived. My interpreter suspecting the nature of their visit, sent two boys to overhear their conversation; from which he learned that they were sent to convey me back to Bubaker. The same evening two of the Moors came privately to look at my horse, and one of them proposed taking it away; but the other one said I should never escape with such an animal. They then enquired where I slept, and returned to their companions. All this was a stroke of thunder to me, for I dreaded nothing so much as confinement among the Moors. I now determined to attempt an escape, and communicated my design to Johnson, who applauded my resolution, but declined following me any further for reasons which were just enough. About midnight I got my clothes in readiness, which consisted of two shirts, two pair of trowsers, two pocket-handkerchiefs, an upper and under waistcoat, a hat, and a pair of half boots: these, with a cloak, constituted my wardrobe, and I had not one single bead, or any other article of value in my possession to purchase victuals for myself or corn for my horse. About day-break Johnson, who had been listening to the Moors all night, came and whispered to me that they were asleep. The awful crisis was now arrived when I was again to taste the blessings of freedom, or languish out my days in captivity. A cold sweat moistened my forehead, and I thought on the dreadful alternative, and reflected that one way or the other my fate must be decided in the course of the ensuing day. But to deliberate was to lose the only chance

of escaping; so taking up my bundle I stepped gently over the negroes who were asleep in the open air, and having mounted my horse, I bade Johnson farewell, desiring him to take particular care of the papers I had entrusted him with, and inform my friends in Gambia that he had left me in good health on my way to Bambara. I proceeded with great caution, surveying each bush, and frequently listening and looking behind me for the Moorish horsemen, until I was about a mile from the town, when I was surprised to find myself in the neighbourhood of a korree belonging to the Moors. The shepherds followed me for about a mile, hooting and throwing stones after me. When I was out of their reach, and had begun to indulge the pleasing hopes of escaping, I was alarmed by a 'Halloo!' from behind me; looking back I saw three Moors on horseback, coming towards me at full speed, whooping and brandishing their double-barrelled guns.

"I knew it was in vain to think of escaping, and therefore turned to meet them; when two caught hold of my bridle, one on each side, while the third, presenting his musket, told me I must go back to Ali. When the mind has for some time fluctuated between hope and despair; tortured, hurried, and tossed with anxiety from one extreme to another, to know the worst gives relief. An indifference to life and all its enjoyments seized me; my faculties were benumbed, and I rode back with the Moors apparently unconcerned. In this state of feeling, as we passed some bushes, one of the Moors ordered me to untie my bundle: having examined the articles, one seized my cloak and wrapped it about himself. This cloak had been a good friend to me; it had covered me from the rains by day and the musquitos in the night; I therefore followed them, and earnestly begged they would restore it me; but they paid no attention to my request, riding off at speed with the prize. One of them, when I followed for my cloak, struck my horse on the head and presented his musket. I then perceived that they had followed me for the sole purpose of plundering me, and that they had not been sent by any authority to apprehend me.

"I had reason now to congratulate myself, not only on my escape from Ali, but with my life, though in great distress, from such a horde of barbarians. As soon as I lost sight of the Moors, I struck into the woods, and directing my course at full speed towards my former route from Queira to Deina, was fortunate enough to fall in with the path."

Mungo Park, after his return, married and commenced business at Peebles, in his native country, in 1801, and appeared to have given up all thoughts of future travels. The British government, however, gave him so strong an inducement that he subsequently went out on a second expedition of discovery. This undertaking, however, was peculiarly unsuccessful, as Mr. Park and nearly all his fellow travellers lost their lives in the undertaking. Mungo Park was stated to have been drowned; and the other Europeans died from the baleful effects of the climate. An account of Park's second journey, so far as his own narrative extended, with a Memoir of his life by Mr. Wishaw, was published in 1815.

PARKER, MATTHEW, an English prelate, who was born at Norwich in 1504, and became celebrated for his great learning and the uncompromising rectitude of his religious principles. The æra of the complete and permanent establishment of the protestant

religion in Great Britain, comprises the most interesting part of the ecclesiastical history of these kingdoms; and one of the principal instruments for accomplishing this important business was Matthew Parker. His father died when he was very young, but having ordered by his will that he should be devoted to the church, his mother sent him to Corpus Christi college, Cambridge, where his genius, improved by application to those studies which are peculiarly adapted to the sacred function, and established his reputation as a man of great learning for his age. In 1531 he entered into priest's orders, took the degree of master of arts, and was chosen fellow of his college. At this time a flattering testimony of his abilities was given by Cardinal Wolsey, who offered him one of the first fellowships in his new college at Oxford; but by the persuasion of his friends he declined the invitation, and continued at Cambridge prosecuting his studies. In 1533 he commenced preacher and became very popular, and Cranmer sent him a special license to preach in his diocese, and recommended him to the notice of Henry VIII. The king sent for him to court the same year, and his queen, Anne Boleyn, being much pleased with a sermon preached before her, in which Parker avowed the principles of the reformed churches abroad, she appointed him one of her chaplains, and upon her fatal reverse of fortune gave him private injunctions respecting her daughter, the princess Elizabeth, the care of whose education she particularly directed should be entrusted to him. Parker's first benefice in the church was the deanery of Stoke in Suffolk, which the king gave him on the queen's solicitations in 1434; and from this time to the death of his royal patroness we meet with nothing remarkable respecting him, except an accusation brought against him by the popish party for exposing the errors of the catholic church with great freedom in his sermons at St. Paul's Cross; but he defended himself so well that he was ordered by the lord chancellor Audley to persevere in so good a cause, regardless of the menaces or accusations of his adversaries. Henry made Parker one of his chaplains after the fall of Anne Boleyn; and during the remainder of that reign he continued rising in the church and in the university of Cambridge. The degree of doctor of divinity was conferred on him in 1538. In 1544 he was elected master of his college, and the following year vice-chancellor.

During the short reign of Edward, Dr. Parker chiefly distinguished himself as a frequent and zealous preacher in support of the reformation, and for the part he took in the suppression of the rebels under Kett, the tanner, of Norwich. Dr. Parker being one of their countrymen went to their camp, and persuaded them to submit to the king and return to their families and occupations, which had such an effect that many dispersed, and their army being considerably diminished, became an easier conquest to the king's forces commanded by the earl of Warwick, who totally defeated them. It is rather extraordinary that Parker was not promoted in this reign, in which we do not find that he received any addition to the ecclesiastical preferments he enjoyed at the demise of Henry. We are told indeed by Strype, that "he was nominated to a bishopric, which he either refused, or others stepped in before him." But when Queen Mary ascended the throne his enemies deprived him of all his preferments. On the accession of Queen Elizabeth, she appointed him to fill the

archiepiscopal see of Canterbury, vacant by the death of Cardinal Pole, and he was consecrated at Lambeth in 1559.

Archbishop Parker extended his influence for the protestant interest to the kingdom of Ireland, where religion had suffered the same revolutions as in England; the reformation having been set on foot during the administration of Cromwell, earl of Essex, in the reign of Henry VIII., by George Browne, archbishop of Dublin, an Englishman, and an Augustine friar of London, who was promoted to that see by Cromwell's recommendation. This prelate was the first clergyman in Ireland who embraced the reformation. He proceeded in it with such zeal that he carried the bill for establishing Henry's supremacy through the parliament of Ireland at a time when even the attempt was considered dangerous. He also removed all superstitious relics from the churches, and was the first who ordered the Lord's Prayer, the Creed, and the Ten Commandments to be placed in their stead at the altars. He continued to exert the same active zeal in the reign of Edward; but in the first year of Mary, being a married man, he was deprived, and died soon after. Popery was then restored again in Ireland; but when Archbishop Parker had settled the affairs of the church of England, he sent over instructions to Hugh Corwin, archbishop of Dublin, for completing the reformation of the church of Ireland, and he was to be supported by the earl of Sussex, newly appointed the queen's lieutenant of that kingdom. Accordingly the Litany was sung in English at the cathedral in Dublin, the earl and his court being present, which so much displeased the catholic party that they had recourse to a miracle. The particulars of this last effort to impose on the credulous are very curious, therefore we shall give them in the words of Strype, who relates the story as communicated in a letter from Archbishop Corwin to Archbishop Parker:—

"There was in the cathedral an image of Christ in marble, standing with a reed in his hand and a crown of thorns on his head; and while service was saying before the lord-lieutenant the archbishop, the rest of the privy-council and the corporation of Dublin (on the second Sunday of singing the English Litany), blood was seen to run through the crevices of the crown of thorns, trickling down the face of the image. The people did not perceive it at first; therefore some who were in the fraud cried out to one another, and bade them see how our Saviour's image sweat blood. Whereat several of the common people fell down, with their beads in their hands, and prayed to the image. Vast numbers flocked to the sight, and one present, who indeed was the contriver, and formerly belonged to the priory of the cathedral, told the people the cause, viz., that he could not choose but sweat blood whilst heresy was then come into the church. The confusion hereupon was so great that the assembly broke up. But the people still fell upon their knees, thumping their breasts; and particularly one of the aldermen, the mayor of the city, whose name was Sedgrave, and who had been at the English service, drew forth his beads, and prayed with the rest before the image. The earl of Sussex, and those of the privy council, hasted out of the choir fearing some harm. But the archbishop, being displeased, caused a form to be brought out of the choir, and bade the sexton to stand thereon, and to search and wash the image, and see if it would bleed afresh. The man

soon perceived the cheat, observing a sponge within the hollow of the image's head. This sponge, one Leigh, the person above mentioned, had soaked in a bowl of blood, and early on Sunday morning, watching his opportunity, placed the said sponge, so swollen and heavy with blood, over the head of the image within the crown, and so, by little and little, the blood soaked through upon the face. The sponge was presently brought down and shown to these worshippers; who began to be ashamed, and some of them cursed Father Leigh, who was soon discovered, and three or four others who had been the contrivers of it. These were exposed and punished, and the archbishop ordered the image to be removed."

Among the prejudices retained by Queen Elizabeth was a strong aversion to the marriages of priests, upon which subject she would certainly have come to a rupture with the archbishop, if Cecil had not compromised matters by getting Parker, who was as tenacious of his opinions as her majesty, to agree to a royal injunction, that no head or member of any college or cathedral should bring a wife, or any other female into the precincts of it, to abide in the same, on pain of forfeiture of all ecclesiastical preferments. The archbishop had written a letter to her majesty exhorting her to select a husband, to which he had procured the signature of some other prelates; and now, upon his application to her to revoke this injunction, she treated the suggestion with marked contempt, telling the archbishop she repented having made any married men bishops; on which he wrote a sharp letter to the secretary of state, informed him that the bishops were all dissatisfied with the queen, and that for his part he repented his having accepted the station he now held. This misunderstanding, however, was no sooner adjusted than a religious quarrel of another nature broke out among the clergy of the established church.

The queen, in consequence of a clause in the act of uniformity which empowered her to add any rites and ceremonies she thought proper to the established church, had enjoined particular ecclesiastical habits to be worn by the different orders of the clergy; to these regulations some implicitly conformed, others rejected part of their dress, and not a few the whole, as the relics of catholic superstition. Surplices and copes in particular were strongly objected to. As the majority of the laity were against these habits, the clergy who wore them were frequently subjected to insult, and our archbishop, whose advice the queen chiefly followed, was severely censured as the author of those disturbances. But neither Parker, nor the rest of the prelates of his party, made any concession to quiet the minds of the dissatisfied: on the contrary, when the two archbishops were sent for to court, and commanded to restore the peace of the church, they immediately pursued such measures as were calculated to enforce obedience from the clergy; and the laity were left out of the question, unless they conformed to the ordinances drawn up by the clergy for due order in preaching and administering the sacraments, and for the apparel of ecclesiastical persons.

In consequence of these regulations, the breach was widened; for all the licenses for preaching were directly cancelled, and no new ones granted but to such of the clergy as would subscribe to the queen's original injunctions respecting the ecclesiastical habits, and to the ordinances set forth by Parker, containing some articles to which many of the clergy,

and a considerable body of the laity, could not be brought to conform. Among other things, the principal minister was to wear a cope when he administered the sacrament: at prayers they were all to wear surplices; in the parish churches, and in cathedrals, hoods, in which they were to preach: the communion-table was to be placed in the east, and no person permitted to receive the sacrament in any other posture but kneeling. And, finally, no person to be ordained, who had not taken degrees at Oxford or Cambridge. A violent schism ensued, and such numbers of the clergy resigned their benefices that the two universities could not supply men of abilities to fill up the vacancies. The bishops were therefore obliged to procure degrees for, and to ordain, many illiterate persons, but whom they found ready to comply with any forms or ceremonies by which they might be inducted to valuable livings. But among the clergy who refused to conform were many persons of the first reputation for piety, learning, and moral character. These had considerable interest at court, and they were countenanced by many of the moderate bishops, particularly by Jewel, bishop of Salisbury, and Pilkington, bishop of Durham, who, as they had been exiles for their profession of the protestant faith, could not be suspected of want of zeal; and therefore they wrote to the earl of Leicester, representing that in things indifferent in themselves compulsion should not be used,—and that many ministers were resolved to leave their livings rather than comply,—that it would be impossible to find proper teachers, and there were many places without any. Leicester, already inclined to favour the cause of the nonconformists, gained over several courtiers, and who prevailed on the queen to withdraw the royal sanction, and leave the ordinances to the ecclesiastical court, which had sufficient authority over the clergy, by the canon law, to enforce obedience if it was judged necessary to exert it; and thus the odium of a spiritual persecution against the Puritans was taken off from the crown, and thrown upon the archbishops and their party.

Parker, exasperated at this measure, openly declared that the queen had ordered him to draw up the injunctions and the ordinances, and he resolved to abide by them. He now published them under the title of advertisements, and cited Sampson, dean of Christ's Church, Oxford, and Humphreys, president of Magdalen college, to appear before him, and other ecclesiastical commissioners; and after trying every persuasive argument to induce them to conform, they were menaced with deprivation in case of refusal, and a short time was allowed them to give in their answer. This, however, they employed in writing a letter to the commissioners in support of religious liberty. With great coolness and judgment they expressed their concern, that such a dissension should arise for so trifling a subject, *propter lanam et linum* (meaning the square cap and the surplice); and only required the same indulgence for their opinions which they were ready to grant to those who differed from them. This law respecting the restoring the ceremonies of the church of Rome, they said, appeared to them to be joined with the hazard of slavery, necessity, and superstition: "But because this does not seem so to you, you are not to be condemned by us; because this does seem so to us, we are not to be vexed by you." These and other arguments equally fraught with the spirit of primitive

Christianity, charity, and affection, had no weight with the commissioners, who acted under the influence of the archbishop, and he was determined to make an example of the two divines, who were universally respected for their great learning, their zeal in the protestant cause, and their sufferings on that account in the reign of Queen Mary. Accordingly, on their second appearance, they were ordered to comply by the archbishop, and on their refusal they were taken into custody and confined in the archbishop's palace at Lambeth; after which they were deprived, and then released. Soon after the archbishop ordered the whole body of the London clergy to appear before him, with the ecclesiastical commissioners, at Lambeth, to subscribe to the injunctions and ordinances, and having given notice of his intention to the court, he requested Cecil and several members of the privy council to be present; but he could not obtain their consent. However, he found means to procure a royal proclamation, requiring uniformity in the habits of the clergy, under pain, upon refusal, of being silenced and deprived. When the London clergy appeared in court, they were admonished to follow the pious example of Thomas Cole; who, overcoming his scruples by the force of persuasions, had conformed, and being dressed in the habit required by the injunctions, was placed before the commissioners. The archbishop's chancellor then addressed them in these words, as recorded by Strype:—

"My masters, and ye ministers of London! the council's pleasure is, that strictly ye keep the unity of apparel, like to this man (pointing to Mr. Cole), that is, wear a square cap, and a scholar's gown, priest-like, a tippet, and in the church, a linen surplice, and inviolably observe the rubric of 'The Book of Common Prayer,' and the queen's majesty's injunctions, and the Book of Convocation (the Thirty-Nine Articles). Ye that will subscribe, write *Volo*; those that will not subscribe, write *Nolo*. Be brief, make no words." And when some of the clergy offered to speak, he interrupted them, crying, "Peace, peace,—apparitor, call over the churches; and ye masters, answer presently, *sub pœnâ contemptûs*, and set your names." Of ninety-eight present, sixty-one subscribed; and when the rest presented a paper to the archbishop, assigning their reasons for refusing, his grace told them, that it was no part of the duty of the commissioners to debate; adding, "he did not doubt, but when they had felt the smart of want and poverty, they would comply; for the wood as yet was but green."

The archbishop's zeal at length carried him beyond the limits of his duty, for he wanted to influence the house of commons to submit all matters concerning religion to the bishops. Mr. Strickland and Mr. Wentworth strenuously opposed this arbitrary proceeding, in which the queen was impolitically concerned; and, after very warm debates, the commons were obliged to agree to her majesty's pretensions, though by no means well founded, that as supreme head of the church, the ordering of all things thereunto belonging was a branch of her royal prerogative; and Mr. Wentworth for his freedom of speech in this debate was sent to the Tower. The queen then committed this prerogative into the hands of Parker, and the prelates of his party, who, not content with requiring subscription to the Thirty-Nine Articles, exceeded the penalties prescribed by law for refusal;

and the archbishop made a personal visitation in the Isle of Wight, at that time chiefly inhabited by foreign protestants of different persuasions, who had fled from Romish persecution. It had been the policy of government hitherto to let these strangers enjoy religious toleration, especially as there were amongst them many Calvinists; but Parker having information that not a few of the nonconforming clergy had found an asylum and an hospitable reception in that island, he resolved to enforce the act of uniformity there, never thought of before, and upon meeting with almost a general refusal, he deprived the clergy and ordered the churches to be shut up. This intemperate zeal, when it came to be known at court, highly displeased the queen. Parker could but ill brook any coolness from the queen or her ministry, as he always pretended that the warmth of his zeal "was for the advancement of her majesty's honour and the support of her royal prerogative, and therefore he retired from court, and wrote a very sharp letter to Cecil Lord Burleigh, then high treasurer and first minister of state, expressing his discontent at the opposition formed against his measures, and declaring both the church and the state to be in danger of dissolution from the countenance given to the puritans." The health of the archbishop from this time sunk rapidly, and he died in May 1575. This prelate's "Account of the Archbishops of Canterbury" is a work of great research.

PARKER, RICHARD, an English seaman, who became celebrated as the leader of the dangerous mutiny at the Nore. Parker was born in Exeter in 1760, and having received a good education entered the navy, and served during the American war. After the peace he retired from his professional duties, and married a person of considerable property; but dissipated the whole and became involved in debt. He was confined in Edinburgh, and on his release went as a common sailor on board the royal fleet at the Nore. He did not stand high in the opinion of his officers, but from his abilities obtained the confidence of the men; so much so indeed, that at the breaking out of the mutiny he was appointed admiral of the fleet. The crews of the ships claimed greater liberty of absence, a more just distribution of prize-money, and a more punctual discharge of arrears of pay, with several other privileges and exemptions which were considered inconsistent with the subordination of the navy and the objects of its service; but Parker held so high a rank in the list of mutineers, and was so intimately connected with the whole of their proceedings, that it will be necessary to notice the matter in detail.

On the 21st of May they sent a statement of their demands to Admiral Buckner, to be by him transmitted to the admiralty; to which they peremptorily demanded compliance, as the only terms upon which they would return to obedience. On the 22nd May, one of the commissioners of the admiralty replied, refusing the principal part of their demands, and promising forgiveness to them if they should yet return to their duty. After Admiral Buckner had delivered this answer to the delegates of the fleet, they were allowed only ten minutes to consider and return an answer; in place of doing which they took to their boats, went into the harbour, and brought out all the gun-boats there to the Great Nore; after they had passed the garrison of Sheerness, the gun-boats all

of doing any damage, but to show their defiance of the fort. The determination of the delegates in consequence of the above answer from the admiralty was, "That nothing could be settled till three of the board of admiralty came down to Sheerness."

On the 23rd the mutineers struck the flag of Vice-Admiral Buckner on board the Sandwich, and hoisted the red flag, the symbol of mutiny, in its stead. They compelled all the ships which lay near Sheerness to drop down to the Great Nore, in order to concentrate the scene of their operations. On board this flagship each man of war sent two delegates, who went on shore daily; and after holding their meetings paraded the streets and ramparts of the garrison with flags and music. On the 24th the seamen received another letter repeating the offer of pardon, to which a peremptory refusal was sent, signed by Richard Parker, their president.

Matters had now risen to such an alarming height that a deputation of the lords of the admiralty, composed of Lord Keith and Sir Charles Grey, were despatched to Sheerness. On the 29th their lordship, held a board at Commissioner Hartwell's house; the delegates were sent for, and every conciliatory measure tried to induce the seamen to return to their duty; a declaration was read on board of all the mutinous ships; but this and all the expostulations of their lordships proved ineffectual; and finding that, instead of being inclined to submission, the mutineers grew more insolent and disobedient, their lordships returned to town, first signifying to the seamen that they were to expect no concessions whatever further than what had already been made by the legislature, the benefit of which they might yet enjoy on returning to their duty.

The seamen now began to perceive their desperate situation, and proceeded to take measures which indicated a design either to secure their present situation or to seek safety by flight: some of the most violent among them suggested the idea of carrying the ships to the enemy; but the majority revolted at so treacherous a proceeding, though even adopted to save their lives, alleging that a redress of grievances was their primary and should be their ultimate object. With a view of extorting compliance with their demands, they ordered the Standard, Brilliant, Inspector, and Swan, to get under weigh and moor across the Thames, in order to prevent a free passage up and down the river to the London trade. The ships of neutral nations, colliers, and a few small craft, were suffered to pass, having first received a passport, signed by Richard Parker as president of the delegates. In order to concentrate their force all the ships which lay near Sheerness dropped down to the Great Nore. The line of battle ships were drawn up in a line at about half a mile distant from each other, and moored with their broadsides abreast. In the space between the line of battle ships the merchantmen and other vessels which had been detained were moored. As all communication was stopped with the shore, the mutineers supplied themselves with water and provisions from these vessels; a party also landed on the Isle of Grain, and carried off a number of sheep and other provisions; besides, to supply their present wants, they took from a trading vessel 300 sacks of flour, which they distributed to the different crews, giving in return bills drawn by the delegates on the admiralty.

On the 26th of May, Admiral Duncan put to sea

with his squadron excepting the Montague and Nassau, whose crews refused to get under weigh under pretence of being in the course of payment. This example was followed on the 29th and 31st by the rest of the squadron, leaving with the admiral only the Venerable and Adamant. Symptoms of mutiny at one time began to appear on board the Venerable—the plot was however fortunately discovered before it came to maturity. Upon which the admiral ordered the hands to be turned up, and addressed them as follows:—"My lads, I am not in the smallest degree apprehensive of any violent measure you may have in contemplation; and though I assure you I would much rather acquire your love than incur your fear, I will with my own hand put to death the first man who shall presume to display the slightest symptom of rebellious conduct." Turning round immediately to one of the mutineers, "Do you, Sir," said he, "want to take the command of this ship out of my hand?" "Yes, Sir," replied the sailor, with the greatest determination. The admiral immediately raised his arm with an intent to plunge his sword into the mutineer's breast; the blow being prevented by the chaplain and secretary, who seized the admiral's arm; he did not attempt to make a second, but with some agitation called the ship's company: "Let those who will stand by me and my officers pass over immediately to the starboard side of the ship, that we may see who are our friends and who are our opponents." In an instant the whole crew, excepting six who had been the promoters of this disturbance, ran over. These were immediately secured in irons; but some time afterwards expressing themselves truly penitent for what they had done, the admiral was induced to liberate them.

Upon the return of the lords of the admiralty to town, a cabinet council was immediately held, when it was determined to employ the most vigorous measures to reduce the rebels. A proclamation was issued for the suppression of the mutinous and treasonable proceedings of the crews of certain of his majesty's ships at the Nore; at the same time offering his majesty's pardon to all such as should immediately return to their duty. The most active measures were at the same time taken to compel the rebellious crews to submit; the shores on both sides were lined with batteries; the forts at Tilbury, Sheerness, and Gravesend, were furnished with furnaces for red hot shot. The buoys at the Nore and along the coast were removed. The Neptune of ninety-three guns, commanded by Sir Erasmus Gower as commodore, manned with volunteers, raised by subscription of the merchants of London; with the Lancaster of sixty-four, whose crew had returned to their duty, accompanied by the Agincourt and several gun-boats; were ordered to drop down the river and proceed to attack the rebels. The firmness of the mutineers began at length to be a little shaken, and they were determined to try once more to effect a reconciliation with government through the medium of the earl of Northesk. For this purpose the two delegates of the Monmouth were rowed on board that ship, and informed his lordship that it was the pleasure of the committee that he should immediately accompany them on board the flag ship as they had proposals to make leading to an accommodation. His lordship complied, attended by one officer: he found the convention in the state cabin, consisting of sixty delegates, with Parker sitting at their head;

who told Lord Northesk, "That the committee with one voice had come to a declaration of the terms on which alone, without the smallest alteration, they would give up the ships; and that they had sent for him as one who was known to be the seaman's friend, to be charged with them to the king, from whom he must pledge his honour to return on board with a clear and positive answer within fifty-four hours." When Parker had read the letter, his lordship said, that he certainly would bear it as desired; but he could not, from the unreasonableness of the demands, flatter them with any expectation of success. They persisted that the whole must be complied with, or they would immediately put the fleet to sea.

Lord Northesk proceeded to London with this despatch; and after stopping a short time at the admiralty, he attended Earl Spencer to the king. The demands of the seamen were rejected as exorbitant and unreasonable. Captain Knight, whom they had permitted to go on shore upon the promise to return, carried down the refusal of the lords of the admiralty. All hopes of accommodation being now at an end, measures were taken by Lord Keith and Sir Charles Grey to attack the fleet from the works at Sheerness, with the gun-boats, &c.; but fortunately on the 9th of June symptoms of disunion appeared among the mutineers, which rendered the application of force unnecessary. On that day the Repulse and Leopard made their escape, the latter up the Thames; but the Repulse unfortunately ran aground, and was pursued and fired upon by the Monmouth; happily no lives were lost.

On the 13th, the Agamemnon, the Standard, the Nassau, the Iris, and the Vestal, deserted the rebels and went up the Thames, or under the guns at Sheerness; the crews, however, of these vessels were far from being unanimous, as several men were killed or wounded in the struggles which took place on board them, between the partizans of the officers and those of the seamen. The crews of all the ships now intimated an inclination to submit, provided a general pardon should be granted. The crew of the Sandwich was particularly desirous, and Parker did not oppose this spirit—a spirit greatly accelerated by the arrival on board of Lieutenant Mott with the proclamations, acts of parliament, &c., of which the men complained that they had been kept in ignorance till that period. In the course of the evening the men resolved to submit and accept of the king's mercy, conceiving, no doubt, that it would be extended to those who had not known to what extent they had offended. In this state the crew of the Sandwich carried the ship under the guns of the fort at Sheerness the next morning: upon which Admiral Buckner sent his boat with a guard of soldiers to arrest Parker and bring him on shore. As soon as he had heard that a boat was come along-side for him, he surrendered himself to four of the ship's crew to protect him from the outrages of the rest of the seamen, whose vengeance he feared. Upon this the officers of the Sandwich delivered Parker, and a delegate by the name of Davis, who had acted as captain under him, with about thirty more of the delegates, into the hands of the soldiers; these were committed to the black hole in the garrison of Sheerness. On the first appearance of the soldiers one of the delegates, Wallace, of the Standard, shot himself dead, and was afterwards buried in the highway. On the 22nd of

June the trial of Richard Parker commenced on board the *Neptune* off Greenhithe; he was found guilty, sentenced to die, and suffered accordingly on board the *Sandwich*, on the 29th of June, 1797.

Parker met his death with the same courage and determination that he had exhibited through the whole of his struggle for the rights of his fellow seamen. His widow who was left in circumstances of great pecuniary distress, was lately discovered in the lowest state of indigence by some philanthropic individuals, who, much to their honour, have subscribed towards her future support. For this purpose they had a portrait engraved, and the proceeds applied to her use.

PARKER, SAMUEL, an English prelate, who was born in 1640, and educated in the strictest principles of puritanism. However, after the restoration his religious principles underwent a complete change, and were so favourable to the times that he obtained several valuable church preferments. On the accession of James II. he was raised to the see of Oxford, shortly after which he published his work entitled "Reasons for Abrogating the Test imposed upon all the Members of Parliament." He died in 1687, and, in addition to the work already mentioned, he was the author of a History of his own times, "The State of the Church fairly Stated," and "A Demonstration of the Divine Authority of the Law of Nature and the Christian Religion."

PARKER, THOMAS, an English lawyer, who was, in 1788, raised to the office of lord chancellor. After holding this office for some years he was accused of corrupt practices, and the same being proved he was condemned to pay a fine of 30,000*l*. His lordship died in 1732, and was succeeded by his son the second earl of Mansfield. This nobleman became distinguished for his love of science, and was for some time president of the royal society.

PARKES, SAMUEL, a scientific professor of chemistry, who was born at Stourbridge in Worcestershire in 1759, and was educated at Market Harborough. In 1806 he published his highly interesting and valuable "Chemical Catechism." A second edition was soon called for, which contained so many additional facts as to be almost a new work. Many editions have since appeared. In 1808 he published "An Essay on the Utility of Chemistry to the Arts and Manufactures." In the following year he produced his "Rudiments of Chemistry, illustrated by Experiments." In 1815 he published "Chemical Essays, principally relating to the Arts and Manufactures of the British Dominions."

The benevolence of his disposition, and the amenity of his manners, attached him to a large circle of friends; and in him the community lost a most estimable member. His works attest his ardour, diligence, and perseverance in the pursuit of science; nor was he less distinguished by his beneficent efforts and pecuniary liberality in the support of every public institution which tended to increase the happiness or promote the improvement of his fellow creatures. His industry and activity of mind were evinced during his last illness, by his being anxiously engaged in preparing and superintending improved editions of his chemical works. Mr. Parkes died on the 23rd of September, 1825.

PARKINSON, JOHN, an English botanist, who was born in 1567. He was the author of a work entitled "Paradisi in Sole Paradisus Terrestris, or a Garden of all Sorts of Pleasant Flowers which our

English air will permit to be nursed up." In addition to which he published several other valuable works.

PARKINSON, THOMAS, a learned mathematician and philosopher, who was born in Kirkham in Lancashire, and received his education at Christ Church, Cambridge, where he took his degree in 1769, and the same year entered holy orders. In 1787 he published "A System of Mechanics," and shortly after "A System of Mechanics and Hydrostatics." He subsequently obtained a valuable church preferment, and died on the 13th of November, 1830.

PARKHURST, JOHN, an English divine and poet, who was born at Guildford in Surrey, and received his education at Magdalen college, Oxford. He was presented to the rich living of Cleve in Gloucestershire by Edward VI., but on the death of that prince he was compelled to leave the kingdom. After the accession of Queen Elizabeth he returned and was made bishop of Norwich, over which he presided for fourteen years. He died in 1574. He was the author of several theological works.

PARKHURST, JOHN, an English critic, who was born at Catesby in Northamptonshire. He was educated at Clare college, Cambridge, and afterwards entered holy orders, but as he possessed an easy fortune he devoted himself entirely to literary pursuits. He published a valuable "Hebrew and English Lexicon of the New Testament," and "A Treatise on the Defence of the Divinity of the Saviour." His death took place at Epsom in 1797.

PARMEGIANO, an eminent Italian artist, who was born at Parma on the 11th of January, 1503, and baptized by the names of Girolamo Francesco Maria Marzola. Having completed his preparatory studies he went to Rome for the purpose of improving himself, and while there studied with the utmost diligence the antique and the works of the most celebrated painters; but particularly those of Raphael, Michael Angelo, and Julio Romano. Of Raphael, especially, he imitated the style and manner, and as he resembled that painter in beauty of countenance and elegance of deportment, it was currently said that the soul of Raphael had emigrated into the body of Parmegiano. He now added to his other acquisitions the study of anatomy, and proved the delicacy of his taste by avoiding the prominent defect of Michael Angelo, who was reproached with too great a display of anatomical knowledge. In fact, he now formed a style, which was peculiarly his own, and which has been said to unite the characteristics of Raphael, Michael Angelo, and Correggio.

During his short stay at Rome, Vasari says he painted several small pictures, most of which became the property of the cardinal Ippolito de Medici. Of his larger works, the biographer specifies three: a round picture of the Annunciation, which he praises as singularly beautiful, and which was painted for M. Agnolo Cesis; a picture of our Lady and Christ, with several angels, and a St. Joseph, remarkable for the pleasing air of the heads, the beauty of the colouring, and the grace and skill with which it is finished; and a portrait of Signor Lorenzo Cibo, captain of the papal guard, which was said to be equal to life itself. Finally he was engaged to paint a picture for Madonna Maria Baffalina da Citta di Castello, which was intended to be placed in the church of St. Salvatore del Lauro. It represented the Virgin in the clouds, holding a book, with the Child on

her knees; St. John kneeling on the earth, and St. Jerome asleep at a distance; and from this figure it is styled the Vision of St. Jerome. While he was engaged in this performance, the memorable sack of Rome, in 1527, occurred, and an anecdote is recorded of him, similar to that which is related of Protogenes, the Greek painter, during the siege of Rhodes by Demetrius. In consequence of his fixed attention to this work, he neither heard the roaring of the cannon, nor perceived the tumult of the assault, till some soldiers rushed into his apartment and surprised him in the midst of his labours. Fortunately, the chief of the troop, who entered his room, was a man of taste, and being much struck with his composition, checked the rapacity of his followers, and exacted from the painter only some sketches in pen and ink, with which he was highly gratified. Another party, more regardless of the arts, insisting on money, he went out to borrow a sum from a friend, when he was seized by a third troop, by whom he was imprisoned until he had found means to satisfy their demands.

A city recently sacked and filled with foreign troops being an insecure residence for an artist, he retired to Bologna, where he lodged in the house of a saddler, his countryman and friend, and proposed to remain for a time with the view of etching his best compositions, the art of engraving on copper having been recently discovered. During his residence at Rome, Parmegiano is said to have invented the chiaroscuro method of engraving on wood; and a print of his own Diogenes, in that style, is falsely attributed to him, for it was done by Hugo de Carpi, the inventor of that method, whose name appears at the bottom of the impression. Some also ascribe to him the invention of etching on copper, and others of mezzotinto; but both without foundation. He seems, however, to have been among the first who introduced etching into Italy, and to have greatly improved the art. During his residence at Bologna, he not only made many etchings of his own works, which were much admired, but employed a skilful artist, named Bernardo da Trento, to engrave others. He was at length diverted from his pursuit by the treachery of Bernardo, who decamped, after stealing his tools and designs. In consequence of this loss, he resumed the pencil and painted many pictures for different individuals and convents. Among these are enumerated a St. Roque, attacked with a plague; a Conversion of St. Paul, with numerous figures, a landscape, and a Madonna of great beauty, for his host the saddler. Indeed several of his most esteemed pieces were executed in that city; and it is singular, that during so short a stay his pencil should have been so wonderfully productive.

The latter part of his life was marked with such distress as is the consequence of irregularities, and which too often sully the brightest genius. He engaged with the confraternity of La Steccata to paint the church, for which he received several advances. Not proceeding in his undertaking, he was arrested and imprisoned at the suit of the monks, but released upon a promise to fulfil his task. He did not, however, long survive his liberation from prison, for he was seized with a violent fever, which hurried him to the grave, on the 24th of August, 1540, in his thirty-seventh year, dying, by a singular coincidence, at the same age as his favourite prototype, the inimitable Raphael. His body, at his own request, was removed from Casal Maggiore, and interred in the church of

the convent of Fontana, naked, with a cross of cypress laid on his breast.

The style of Parmegiano is evidently grounded on that of Correggio, though he successfully superadded the characteristics of Raphael and Michael Angelo. He is, however, far removed from the reproach of servile imitation, and though he has so admirably blended their respective beauties, his style is exclusively his own. His chief object was delicacy and elegance, which he has evinced in the air of his female figures, the contrasts of his attitudes, and the easy flow of his drapery.

He is indeed reproached as a mannerist, for carrying these peculiarities to excess; and, particularly in his zealous imitations of the antique, is said to have made the extremities of his female forms too slender for the proportions of natural beauty. This defect is remarked in one of his finest figures, which is thence called the Madonna del Collo Lungo, or long-necked Madonna. But although he may in some degree merit the censure of sacrificing such essentials to ideal elegance, he has fully proved his ability to attain sublimity and dignity. Of this many proofs may be drawn from his works in fresco, and particularly from his celebrated figure of Moses breaking the tables of the law, which is highly impressive, for the character of the head, the majesty of the form, and the energy and dignity of the attitude. "Of this figure," Sir Joshua Reynolds observes, "we are at a loss which to admire most, the correctness of the drawing, or the grandeur of the conception."

Among the excellencies of Parmegiano we may enumerate the appropriate and harmonious tone of his colouring; and may equally commend the judicious arrangement of his subjects; for he generally abstained from crowding his field, and was thus enabled to give his figures their due proportion and full effect. Indeed, almost the only composition mentioned by his biographers, as departing from this rule, is Christ preaching to the multitude, which was preserved in the villa of Colorno, belonging to the sovereigns of Parma. Another excellence was his skill and accuracy in design, in which he has been justly compared to Raphael. So ambitious was he of perfection in this branch of art, that he is said to have made repeated draughts of his principal figures; and of the Adam in the Steccata, in particular, no less than three different sketches have been discovered and engraved. Hence he is said to have been slow and deliberate in his conceptions, forming his plan with great care before he took up the pencil, and then finishing his work with that freedom and decision which called forth so warm and enthusiastic an eulogium from Albani.

PARNELL, THOMAS, an English poet of considerable talent, who was born in 1679, and educated at Trinity college, Dublin; after which he entered holy orders. In 1713 he was presented to the vicarage of Finglass, but did not long enjoy his preferment, as he died at Chester while on his way to Ireland in 1717. A collection of his poems were published in 1721 by Pope: they consist of his "Rise of Woman," "The Fairy Tale," "The Hymn to Contentment," "Health," "The Vigil of Venus," "The Night-piece on Death," "The Allegory on Man," and "The Hermit." These have been respectively criticised by his biographers, Goldsmith and Johnson, and have stood the test of nearly a century. "His praise," says Dr. Johnson, "must be derived from

the easy sweetness of his diction; in his verses there is more happiness than pains; he is sprightly without effort, and always delights, though he never ravishes: every thing is proper, yet every thing seems casual."

In 1758 a volume was published, it is not known by whom, entitled "The Posthumous Works of Dr. Thomas Parnell." This, although it exceeded the volume published by Pope in bulk, appeared so far inferior in merit, that the admirers of Parnell questioned the authenticity of most of the pieces; and there are but a few of them indeed which can be ascribed to him without some injury to his character. Goldsmith refused to incorporate them with the collection he published in 1770; but they were afterwards added to the edition in Johnson's Poets, and apparently without his consent. He says of them, "I know not whence they came, nor have ever inquired whither they are going."

PARNELL, WILLIAM, a catholic writer, who was principally remarkable as the author of the following works:—"The Causes of Popular Discontents in Ireland," and "The Apology for the Catholics." He died on the 2nd of June, 1820.

PARR, SAMUEL, a learned divine and critic, who was born on the 15th of January, 1745. He was early sent to the celebrated school at Harrow-on-the-Hill, of which place he was a native, and at the age of fourteen became head boy in that establishment. He was, however, shortly after removed from school and placed behind his father's counter. He, however, entertained so strong a dislike to his father's profession, that after three years' struggle against his father's wishes he was placed at Cambridge. He did not long derive the benefits of academical instruction. His father died, and Parr's poverty compelled him to quit that seat of learning in which his genius and perseverance must have earned for him the highest honours. He, however, made extraordinary classical acquisitions, and was rewarded by Dr. Sumner selecting him, at the early age of twenty-one, as his head assistant. At Christmas 1769 Dr. Parr was ordained to the curacies of Wilsdon and Kingsbury, Middlesex, which he resigned at Easter 1770. In 1771 he was created M. A. per literas regias, and in the same year, on the death of Dr. Sumner, he became a candidate for the head-mastership of Harrow, with the late master's strong recommendation. Although sanguine hopes were entertained by his friends of his success, his youth and other influence prevailed against his nomination, to the great disappointment of the scholars. The election fell upon Dr. Heath. Dr. Parr subsequently resigned the place of assistant, and established a private academy at Stanmore with forty-five boys, of whom all but one followed him from Harrow. It then became desirable, and even necessary, that he should be married; he therefore allied himself to Jane, daughter of Zachariah Marsengale, Esq., of Carleton. This lady was an only child, bred up by three maiden aunts, as she said of herself, "in rigidity and frigidity;" and she always described Dr. Parr as "born in a whirlwind, and bred a tyrant." Such discordant elements were not likely to produce harmony. The lady lost few opportunities of annoying her spouse, an object which a strong understanding and caustic powers of language afforded her more than ordinary facilities of accomplishing; and she always preferred exposing his foibles and ridiculing his peculiarities in the presence of others. By this

lady, who died at Teignmouth in April 1810, Dr. Parr had several children who died in their infancy, and two daughters who grew up.

The period of Dr. Parr's continuance at Stanmore was five years. "The boys who accompanied him," to use the words of one of his pupils, "were, in general, the flower of Harrow school, in the zenith of its glory, when a Sumner presided in its academic howers. Many were young men of considerable talents and matured intellect, and detested alike a Persian, a Grecian, or an English tyrant; knew the language, and glowed with all the fervour, of Demosthenes. The fine Alcaic fragment in praise of Harmodius and Aristogiton, the deliverers of Greece, echoed from every tongue, and had been translated by almost every hand among the elder of them. The master, however, was no advocate for insubordination, since nobody ever carried school discipline to a higher pitch; the result of which, on some occasions, brought on him unmerited obloquy. That the democratic spirit prevailed, though to no culpable extent, among the gentlemen about that period educated at Harrow, may in some degree be accounted for by their being so well read, under the tuition of their learned deceased master, in Greek history, by which they were naturally interested in the fate of liberty,—that liberty whose cause was so well supported by its orators against the armies of the Persian satrap and the insidious designs of Philip. The power of gold had also been recently, and to an alarming extent, tried in their own country by the daring minister, who is said to have affirmed that every man had his price."

The advantages of the Stanmore establishment were not, however, equal to the doctor's expectations. His expenses were excessive, his profits therefore inconsiderable, his labours most oppressive, and he found the impossibility of supporting his situation against the influence and credit of a great public school, and the well-founded reputation of his competitor, Dr. Heath; he therefore, in 1776, was induced to accept the mastership of Colchester school, and thither a considerable part of his Stanmore scholars followed him. He was ordained in 1777, and held the cures of the parishes of Trinity and the Highe, Colchester. In 1778 he obtained the mastership of Norwich school, and in 1780 received the preferment of the rectory of Asterby in Lincolnshire. In the summer of this year he commenced his career as an author by the publication of "Two Sermons on Education." In the summer of 1781 appeared "A Discourse on the late Fast, by Phileleutherus Norfolciensis." This sermon has been considered the best of Dr. Parr's productions, and had a corresponding success; for, though anonymously published, the whole impression was sold in two months. In the spring of 1783 Lady Trafford, whose son he had educated, presented him with the perpetual curacy of Hatton; and in April 1783 he removed there, where he spent the remainder of his days, retiring, while yet in the enjoyment of youth and strength, from the fatigue of public teaching, and devoting his leisure to the private tuition of a limited number of pupils. After this preferment he resigned Asterby. In the same year he obtained from Bishop Lowth the prebend of Wenlock Barns, in the cathedral of St. Paul. In 1785 he resumed his former subject in "A Discourse on Education, and on the Plans pursued in Charity Schools," and about 1000 copies were sold in a very short time. This quarto volume is an able and masterly argument for popu-

lar education and improvement, and had the merit of being one of the first publications which concentrated public attention on the all-important subject of the moral and intellectual instruction of the people. In 1787 Dr. Parr assisted the Rev. Henry Homer in a new edition of the three books of Bellendenus, a learned Scotsman, humanity professor at Paris in 1602, and master of requests to James I. These he dedicated to Burke, Lord North, and Mr. Fox. He prefixed a Latin preface, with characters of those distinguished statesmen, the style of which is, perhaps, the most successful of all modern imitations of Cicero. Bellendenus had intended a large work, "*De Tribus Luminibus Romanorum*,"—"The Three Lights of Rome," Cicero, Seneca, and the elder Pliny; whence Dr. Parr conceived the idea of delineating the characters of the then three most eminent senators of Great Britain. But however great the inappropriateness of the modern appendage to Bellendenus may have been, and however Dr. Parr might have more appositely employed his critical talents, certain it is, that the taste and character of the composition, and the singular discrimination in the portraits, created an extraordinary sensation in the literary and political world. A translation was published in octavo in 1788, but without the author's approbation. Dr. Parr had thenceforth fully committed himself on the side of the popular party. This naturally terminated all hope of church preferment from the court; and such was the low state of Dr. Parr's pecuniary resources, that a subscription was made by the leading Whigs of the day, and a well-merited annuity of 300*l.* was purchased for Dr. Parr's life.

In 1789 appeared "*Tracts by Warburton and a Warburtonian, not admitted into the Collection of their respective Works*." Although it was thought that personal feelings towards Bishop Hurd gave origin to this volume, yet it was allowed on all hands to contain some admirable critical remarks. It produced a reply, entitled, "*A Letter to Dr. Parr, occasioned by his Republication*," &c. In 1790 Dr. Parr exchanged the curacy of Hatton (though he still continued to reside there as deputy-curate) for the rectory of Waddenhoe in Northamptonshire. In the same year he became acquainted with Dr. Priestley. For this intimacy he thus apologizes:—"I am at a loss to see why a clergyman of the church of England should shun the presence of a dissenting minister merely because they do not agree on doctrinal points which have long divided the Christian world; and, indeed, I have always found that, when men of sense and virtue mingle in conversation, the harsh and confused suspicions which they entertained of each other give way to more just and more candid sentiments."

In 1793 Dr. Parr was plunged into the depths of an important controversy. He had been induced to afford advice and assistance to Mr. Homer and Dr. Charles Combe in editing a splendid and comprehensive edition of Horace. Mr. Homer was an accurate and not unsuccessful editor of the prose classics; but his exertions on a poet of the very first order are supposed to have hastened his end. On the demise of Mr. Homer the bulk of the undertaking devolved on Dr. Combe, who was found incompetent to the discharge of so arduous a task; and Dr. Parr's assistance towards the second volume was withdrawn, and he was induced to publish some severe animadversions in "*The British Critic*." In reply to this Dr. Combe published a pamphlet, entitled, "*A State-*

*ment of Facts relative to the Behaviour of the Rev. Dr. Parr to the late Mr. Homer and Dr. Combe, in order to point out the source, falsehood, and malignity of Dr. Parr's attack in 'The British Critic,' on the character of Dr. Combe.*" In this statement Dr. Parr was accused of breach of promise, violation of friendship, and even want of veracity; he was styled by his antagonist the "literary Ajax;" and to make that epithet good, he replied in a closely printed octavo pamphlet of ninety-four pages, called, "*Remarks on the Statement of Dr. Charles Combe, by an occasional Writer in 'The British Critic,' 1795.*" The following extract from this pamphlet is interesting, as it contains Dr. Parr's own account of his critical labours:—

"The reader will, I trust, excuse me, if, for reasons of delicacy, I now take an opportunity to state the whole extent of the share I have ever had in reviews. To '*The British Critic*' I have sent one article, besides those which were written for the *Horace*. For '*The Critical Review*,' I have furnished a few materials for two articles only. For '*The Monthly*' I have assisted in writing two or three, and the number of those which are entirely my own does not exceed six or seven. In almost all these critiques my intention was to commend rather than to blame, and the only one in which I ever blamed with severity related to a classical work, the editor of which deserved reproof for the following reasons:—He clothed bad criticisms in bad Latinity. He had not availed himself of that information which preceding editions would have supplied to any intelligent editor. From the stores of other critics he collected very little, and from his own he produced yet less that was valuable. But he had indulged himself in rude and petulant objections against Dr. Bentley, and for this I chiefly censured him. Here ends the catalogue of my crimes hitherto committed in reviews; and, as I now have somewhat more leisure than I formerly enjoyed, it is possible that I may now and then add to their number. But I assure Dr. Combe and the public, that whensoever I take upon myself to deal rigorously with any writer, I shall not shrink from the strictest responsibility. My contributions to works of this kind are occasional, and, therefore, I have no right to the benefit of that secrecy which it may be wise and honourable for the regular conductors of reviews to preserve. Of the share which I have already taken, and may hereafter take, in these periodical publications, I never can be ashamed. I might plead the example of many scholars both at home and abroad, far superior to myself in vigour of intellect and extent of erudition. But I wish rather to insist upon the utility of the works themselves, and upon the opportunities which they furnish to men of learning for rendering some occasional service to the general cause of literature. There is no one review in this country but what is conducted with a considerable degree of ability; and though I decline the task of deciding upon their comparative excellence, I have no hesitation in saying that all of them deserve encouragement from learned men. They much oftener assist than retard the circulation of books—they much oftener extend than check the reputation of good books—they rarely prostitute commendation upon such as are notoriously bad. For my part, I am disposed to view with a favourable eye the different opinions and propensities which may be traced in the minds of the different writers. By such collisions of sentiment truth is

brought into fuller view, and a reader finds himself impelled by the very strongest curiosity to examine the reasons upon which men of talents nearly equal have founded decisions totally opposite. By posterity, too, reviews will be considered as useful repositories of the most splendid passages in the most celebrated works. They will show the progress of a country or an age, in taste and arts, in refinement of manners, and in the cultivation of science. They mark the gradations of language itself, and the progressive or retrograde motions of the public mind upon the most interesting subjects in ethics, in politics, and in religion."

On Easter Tuesday, in the year 1800, Dr. Parr preached his justly celebrated spital sermon, at Christ Church, Newgate Street, before Harvey Christian Combe, Esq., the lord mayor. The church, though large, was crowded to excess, and the doctor gratified the more intelligent portion of his hearers by a discourse in which he combated the delusive dogmas of those philosophers who ascribe all benevolence and justice to a selfish principle. This sermon was soon afterwards printed with a number of curious notes, which induced the author of "Political Justice" to publish in the same year an octavo pamphlet, entitled "Thoughts occasioned by the Perusal of Dr. Parr's Spital Sermon, being a Reply to the Attacks of Dr. P., Mr. Mackintosh, and others." A suspension of intercourse between Dr. Parr and Mr. Godwin was the consequence; but a few months previous to his death, Dr. Parr sent Mr. Godwin a message of peace and invitation to Hatton. In 1801 Dr. Parr was offered, but declined it, the vicarage of Winterbourne Stoke, in Wiltshire. In 1802 he was presented by Sir Francis Burdett to the rectory of Graffham, in Huntingdonshire.

On the death of Mr. Fox, Dr. Parr announced his intention of publishing a life of his celebrated friend and political favourite. The expectations of the public were excited, but were certainly disappointed in a publication of two octavo volumes, entitled "Characters of the late Charles James Fox; selected, and in part written, by Philopatri Varvicencia," 1809. A collection of characters from the public journals occupies 175 pages; an original character, in the form of an epistle to Mr. Coke, 135; and the second volume is filled with notes on the amelioration of the penal code and religious liberty, plentifully inlaid with citations from the classics. Considering the grotesque arrangement of matter and subjects, it is not surprising that this work should have experienced well-merited neglect. The following characteristic sketch of Dr. Parr appeared in "Blackwood's Edinburgh Magazine," under the title of "Two Days with Dr. Parr." The author says,—

"When I read the epitaph which the late Dr. Parr selected for his tombstone—'What doth the Lord thy God require of thee, but to do justice, to love mercy, and to walk humbly with thy God?' I smiled, and thought how many a man who in company had felt the weight of his rebuke, or, as a friend of mine once expressed it, had been gored by him, would say, that however he might have walked with God, he did not walk very humbly with men; and yet what I saw of him, led me to believe that when he was not displeased by the conceit, or folly, or something which really deserved castigation in those with whom he conversed, he was singularly condescending and kind—noticing and taking interest in persons of

the humblest capacity, who had no other claim to his attention than a humble and virtuous mind. He had been so long a schoolmaster, that when he ceased to be so he carried his manners and habits from the school-room to the dinner-table, criticising, rebuking, or applauding mankind, as he had formerly done his scholars; and his great learning, his various knowledge, his conversational eloquence, and, latterly, his venerable age and appearance, gave him a claim to this power which was seldom resisted. No man of his age, excepting Dr. Johnson, has said so many things in conversation which have been thought worth remembering and repeating, and which have borne the repetition so well. Of course they lose in the relation—none can enjoy them so much as those who knew him, and who, when they are told what he said, can fancy the manner which accompanied it; but this applies to all oral discourse. What he said was so much set off by his vivacity, his fire, and a kind of pompous dignity, which would have been absurd in any body else, but which harmonized with his age, his wrinkles, and his wig, that, when it is repeated, and all these personal embellishments have evaporated, what remains gives an inadequate notion of the effect which it produced: the dead thought has only a faint resemblance to the living discourse, as Lord Erskine has well expressed it in his introduction to Mr. Fox's speeches; there is as much difference between the report of a speech and the speech itself, as there is between a bust and the living original; 'the fire of the eye is lost in the marble, and those lips are cold and silent which were the fountain of his fame.' As we cannot have the original, let us have the bust.

"When Dr. Parr was in London a few years ago, (it was the last time in his life), he dined at the house of a friend of mine, and I was invited to meet him. As I had never seen him before, I was glad of this opportunity, and went with unfashionable punctuality at the hour appointed for dinner. The party had already assembled, excepting the doctor; presently a carriage drove up to the door, and there was a bustle and talking in the hall whilst he was changing his coat and wig, the latter of which, whenever he went into company, he brought or sent in a band-box, that it might not be discomposed by his hat: at length the servant announced Dr. Parr. Those who never have, and now never are to see him (I write not merely for the present generation, but for those who will live a century hence, for Blackwood will be read then), must fancy an old man visibly above seventy, of middling height and bulk, in a handsome full-bottomed wig, freshly powdered, a clerical coat of the cut of half a century ago, apparently of velvet, a silk apron, and large silver buckles in his shoes: you would have said that he was old-looking for seventy, as far at least as wrinkles were concerned, but a restless, somewhat bustling manner, and a quick speech, showed that age had not quenched the activity and energy of his mind—he had a grey lack-lustre eye, and yet it had an expression of vivacity, of good humour, and often of fun, which showed how much more these appearances depend upon the posture of this organ than on the brilliance of its surface. He talked fluently, nay glibly, but, from a lisp in his speech, which I believe he always had, and now, from the loss of his teeth, it was often difficult, or impossible to catch what he said.

"When we descended to the dining-room, I was

fortunate enough to find myself seated next him. The party was not small. During the dinner he paid too much attention to the dishes to talk much. A plate of lobsters seemed the object of his particular affection, for he eagerly asked, 'Are those lobsters hot?' And on being told that they were so, he desired that one should be taken down to the cook and kept warm till he sent for it. When the dinner was despatched, and the clatter of knives and plates had subsided, the conversation became general and animated, and though I have met many, if not most of my countrymen, distinguished for literature or science, I have seldom heard any thing equal to, and never any thing more striking than his conversation. It was spirited, often vehement; it surpassed the rest of the company more in quality than in quantity, for while it was sufficiently distinguished by the value of the thought, or the felicity of the expression, there was never that everlasting flow which sometimes overlays and smothers conversation. When he said any thing striking it was accompanied by a dictatorial manner, an uplifted arm, and a loud voice; but you could perceive an under expression of humour, as if he was conscious, and meant it to be understood, that it was a piece of acting. In his opinions there was a simplicity, a common sense, a dislike of refinement and paradox, which I was not prepared for; they were the sentiments of a man of good sense—sometimes very simply, sometimes very strikingly expressed. We talked about men who endeavoured to acquire classical learning late in life: he said that the fault they always committed was to over-refine; they must pronounce English words of Latin or Greek origin with a classical accent, when good scholars would pronounce them in the ordinary way. Some one asked what was the rule? Parr: 'Established custom.' He offered to help one of the party to some grass, but would not put it upon his plate till he called it by its name grass. Parr: 'Right, sir, that's the English word; if you had called it asparagus, you should not have had any.' I told him that I had lately seen a gentleman whom he once knew, but whom he had not seen for several years; the Rev. Mr. —, rector of —. Parr: 'A most excellent man;' and then after a pause, and energetically, 'Sir, he is a methodist, but his methodism is founded upon good principles, a fervid imagination, and an affectionate heart; he is a most excellent, and, besides, a most scientific man.' We talked about politics—about the anti-jacobin war—about the debt in which it had involved the nation—and about Mr. Pitt. He told us a story, which he said Mr. Coke of Norfolk had told him, and which Mr. Coke had heard from the person who witnessed the scene. When Mr. Pitt was a youth, some law-lord (could it be Lord Mansfield?) one morning paid a visit to Lord Chatham at his country residence. Whilst they were conversing, his son William came through the library. Lord — asked 'Who is that youth?' Lord Chatham said, 'That's my second son—call him back and talk to him.' They did so, and Lord — was struck by a forwardness of knowledge, a readiness of expression, an unyieldingness of opinion, which even then was remarkable in the future minister. When he had left them, Lord Chatham said, 'That's the most extraordinary youth I ever knew. All my life I have been aiming at the possession of political power, and have found the greatest difficulty in getting or keeping it. It is not on the cards of fortune to pre-

vent that young man's gaining it, and if ever he does so, he will be the ruin of his country.' We dared not ask him whether he thought the prophecy had been verified, and that Old England was ruined, for fear of being gored by him. We talked about theology, and, among other particulars, about the remarkable passage in 'Josephus,' in which Jesus Christ is mentioned, and of the three reasons for believing it to be interpolated. He thought there was no force in one of these reasons,—viz., that the line immediately before the disputed passage obviously relates to the line which immediately follows this passage, so that if the disputed passage is struck out, the text is consistent sense, but as it now stands the passage has no connexion with what goes before and after it, but dissevers parts naturally connected: this he thought proved nothing, because it was easy to suppose that Josephus himself had done what authors are continually doing,—that is, that after having written his history he wrote this passage, and inserted it in the most convenient place he could find. It was certainly an interpolation, but Josephus himself might be the interpolator. He thought that the decisive reason for believing that it was a fraudulent interpolation by a later hand, was the fact that the early defenders of Christianity never referred to it. Have the Jews preserved the work of Josephus? and, if so, is this passage contained in their copies? I have several times put this question to Jews, but could never get a distinct answer from them. One who is now a Christian, and a very sensible man, said, 'There is not a Jew, nor even a Rabbi, who could answer the question: the Jews have preserved nothing, and know nothing.' In the party there was Dr. —, an Arian minister, and Mr. —, a Socinian minister. With these gentlemen he appeared on terms of intimacy and regard; and as the evening advanced, and he became excited with wine (I do not mean indecorously excited), he invited them to drink a parting glass with him, and went round to the other side of the table to touch glasses sociably, first above, then below, and then side to side, or, as he called it, hob-a-hob: it was a parting glass, for they never met again. Seeing that he was on such friendly terms with these gentlemen, I said to him, I suppose, sir, that, although they are heretics, you think it is possible they may be saved. 'Yes, sir,' said he; adding with affected vehemence, 'but they must be scorched first.' We talked of economy: he thought that a man's happiness was secured in proportion to the small number of his wants, and said, that all his life-time it had been his object to prevent the multiplication of them in himself. Some one said to him, 'Then, sir, your secret of happiness is to cut down your wants.' Parr: 'No, sir, my secret is, not to let them grow.' There had lately been a contest for the office of preacher to Lincoln's Inn. Reginald Heber, the learned and eloquent bishop of Calcutta, had been elected, and the other candidate, Dr. Maltby, had lost it by one or two votes. Parr: 'I was very sorry that Edward Maltby was not elected, for he was the very man for them;' adding sonorously, 'his learning would have ensured their respect, his eloquence would have excited their attention, and his courtesy would have won their affections.' Some one mentioned having heard a sermon which he preached at St. Paul's; he seemed much interested to know whether he was heard distinctly; and when told, tolerably so, he said, 'I preached at

St. Paul's only three times in my life; the first time my voice was below the place, the second time it was above the place, the third time I hit it exactly, and that must have been the time when you heard me.'

"The evening was a very agreeable and exciting one. I believe every body enjoyed it, but no one more than Dr. Parr himself. Although he was by far the oldest man of the party, one only excepted, he was the youngest in vivacity and energy. I am uncertain whether it was one or two years after this interview, but at one of these periods, in the autumn, passing through Warwickshire on a tour of pleasure, and having occasion to spend a day or two at Leamington, I employed one morning in driving over to —, to call on him. The servant said that he was gone to Warwick to attend a meeting of the Bible society. We (I and my friends) drove back to Warwick and inquired for him at the Town-hall. He had quitted the meeting, and had gone to the hotel to smoke. I walked alone to the hotel, and there, in a little square parlour, I found him enveloped in clouds of smoke: the skin of his face apparently bronzed by his favourite amusement, for it looked more like dirty parchment than like the complexion of a living man. His grey eye, dim before, was still dimmer now; and I thought that he had aged fast since our former interview. We—(for during the conversation my friends, some of whom had known him longer than myself, had entered the room)—we told him how we had been tracking him first to the parsonage, and then to the Bible society. He said, 'Yes; I went to the meeting to give my sanction to it.' We begged him to come and dine with us at our hotel. At first he refused, insisting that we should go and dine with him; but on being told that our party was too large, and that the smaller one ought to pay the visit to the larger, he consented. He came to the hotel half an hour before dinner-time, and changed his coat and his wig in the carriage. His change of dress had improved his appearance; his face looked less smoke-dried, his eye less dim, and altogether he appeared less altered than he had in the morning; he was very cheerful and animated, talked more and with more fervour than on the former occasion; and yet I have fewer things to relate of his conversation. He said he had long left off attending to the current literature of the day, and that he never read any new publication unless it related to a subject on which he was anxious for information; he talked about education and the different professions, and said that the most desirable one for a man of intellect was that of physic; the practice of the law he said spoiled a man's moral sense and philosophic spirit; the church was too bigotted and stiff-starched; the study and practice of physic was equally favourable to a man's moral sentiments and intellectual faculties. 'I was very near,' added he, 'being a physician; and if I had,' said he, lifting up his arm with an air of jocosely pomposity—We were left to guess what his medical achievements would have been. One of the party, in the course of conversation, quoted a passage from—I forget what writer. Parr, animatedly and sily, 'Do you remember the rest of the passage?'—The answer was, 'No.' Parr: 'Then learn it, for it is worth knowing; do not, like the heretics, quote only half a passage;' and then, after a short pause, and with a pompous but playful air—'or, like the orthodox, quote seven texts, and none of them to the purpose.' We talked about the education of school-

boys; he said it was easy to advise what to do with them when they were twelve or thirteen—that is, send them to a public school, or one equivalent to it in size and eminence, such as Butler's of Shrewsbury; but it was very difficult to advise where to send them from eight or nine up to that age. He said that a father should never interfere with the treatment of his boy at school, at least with the little hardships and severities which he would encounter. We talked of Dr. Johnson; he said he had once begun to write a life of him, and if he had continued it, it would have been the best thing he had ever written. 'I should have related not only every thing important about Dr. Johnson, but many things about the men who flourished at the same time;' adding, with an expression of sly humour, 'taking care at the same time to display my own learning.' He said Dr. Johnson was an admirable scholar, and that he would have had a high reputation for mere learning, if his reputation for intellect and eloquence had not overshadowed it; the classical scholar was forgotten in the great original contributor to the literature of his country. One of the company reminded him of his first interview with Dr. Johnson as related by Mr. Langton in Boswell's account of his life. After the interview was over Dr. Johnson said, 'I do not know when I have had an occasion of such free controversy; it is remarkable how much of a man's life may pass without meeting with any instance of this kind of open discussion.'

"To this remark Dr. Parr replied with great vehemence: 'I remember the interview well: I gave him no quarter.' The subject of our dispute was the liberty of the press. Dr. Johnson was very great; whilst he was arguing, I observed that he stamped. Upon this I stamped. Dr. Johnson said, 'Why did you stamp, Dr. Parr?' I replied, 'Sir, because you stamped; and I was resolved not to give you the advantage even of a stamp in the argument.' It is impossible to do justice to his description of this scene; the vehemence, the characteristic pomposity with which it was accompanied, may easily be imagined by those who knew him, but cannot be adequately represented to those who did not."

Dr. Parr retained his health to a very advanced period of life, but his last illness was long protracted. He died however without pain on the 6th of January, 1825. He was buried in Hatton churchyard, where a monument is erected to his memory, with the following beautiful quotation from the Scriptures:—"What doth the Lord require of thee, but to do justly, and to love mercy, and to walk humbly with thy God?"

PARR, RICHARD, a divine of the church of England, who was born at Fermoy in Ireland in 1617, and received his education at Exeter college, Oxford, after which he entered holy orders. A distinguished prelate of the day, observing the talents of Mr. Parr as a preacher, made him his chaplain; and, subsequently, took him with him to Glamorganshire. On his return he obtained the vicarage of Ryegate in Surrey. In doctrinal points he appears to have concurred with the assembly of divines, who were mostly Calvinists; but it seems doubtful whether he ever took the covenant. In 1649 he resigned his fellowship of Exeter college, and continued chaplain to Archbishop Usher, while that prelate lived. In 1653 he was instituted to the living of Camberwell in Surrey, and appears to have been some time rector of Bermondsey. At the restoration he was created

D. D., and had the deanery of Armagh and an Irish bishopric offered to him, both which he refused, but accepted a canonry of Armagh. He remained vicar of Camberwell almost thirty-eight years, and was greatly beloved and followed. Wood in his quaint way says, "He was so constant and ready a preacher at Camberwell that, his preaching being generally approved, he broke two conventicles thereby in his neighbourhood; that is to say, that by his outvying the presbyterians and independents in his extemporarian preaching, their auditors would leave them and flock to Mr. Parr." All who speak of him indeed concur in what is inscribed on his monument, that "he was in preaching constant: in life exemplary: in piety and charity most eminent: a lover of peace and hospitality: and, in fine, a true disciple of Jesus Christ." He died at Camberwell in November 1691, and was buried in the churchyard. Dr. Parr wrote "Christian Reformation: being an earnest persuasion to the speedy practice of it: proposed to all, but especially designed for the serious consideration of his dear kindred and countrymen of the county of Cork in Ireland, and the people of Ryegate and Camberwell in Surrey," and "Life of Archbishop Usher."

PARRY, CALEB HILLIER, a physician and writer, who was a native of Bath. He was the father of Captain Parry, the commander of the Polar expeditions, and wrote several valuable treatises on the rise and progress of various disorders; in addition to which he wrote the "Elements of Pathology," and a "Treatise on Wool." He died suddenly on the 9th of March, 1822.

PARRY, JAMES, a Welsh antiquary, who was born in Denbighshire in 1787. He was the author of "The Cambrian Plutarch," "The Cambro-Briton," and he also published an edition of "The Transactions of the Royal Cambrian Society." His death took place in 1825.

PARRY, WILLIAM EDWARD.—This active English naval officer, whose name may be enrolled with those of Baffin, Hudson, and Forbisher, was born in the city of Bath in 1790. The rudiments of his education he received at the grammar school of Bath, and at the age of twelve he was placed on board the *Ville de Paris*; and from 1803 to 1806 he continued on board the same ship, employed in blockading the French fleet in Brest. During this time he attended closely to geometry, navigation, French, and other useful branches of learning. His behaviour was exemplary. Admiral Cornwallis said of him, "He has been the pattern of good conduct to all our young people." From the *Ville de Paris* he removed in May to the *Tribune* frigate, which, during 1806, 1807, and 1808, was constantly blockading or cruising, and encountered some of the heaviest gales which had been experienced by the oldest seaman. In January 1807 he was sent in a boat by his commander to reconnoitre in Concarneau Bay, and he executed his commission with such courage as to approach close to a French line-of-battle ship, and such ability as to remain undiscovered by her. In April 1808 the *Tribune* was sent into the Baltic, to which sea she returned in the following year. This service was a fatiguing and perilous one, which, nevertheless, did not acquire for those who were engaged in it all the credit that they deserved. The swarms of Danish gun-boats which issued from the ports of Denmark were most formidable enemies,

being of a low construction, and having, in action, the power of attacking a ship of war in whatever direction they chose, and with an overwhelming number of guns, while she could reply with only a few, and those, in some instances, not capable of carrying a shot so far as the long guns of the enemy. At the age of nineteen Mr. Parry passed his examination, and was promoted to the rank of lieutenant through the interest of Lord Lowther. He joined the *Alexandria* frigate in 1810, and served that year in the Baltic, where he was several times engaged with Danish schooners and gun-boats. In 1811 and 1812 he was on the Leith station, employed in protecting the Greenland whale fishery. During his leisure moments he was not inactive. He prepared charts of the Baltic navigation; he spent part of the night in studying the situation of the principal fixed stars in our hemisphere; and he made a survey of the Baltic sound, and the Voe, in Shetland, an excellent harbour, which was little known. The description of his mode of observing the stars in order to obtain the latitude and longitude at sea by night, he at first distributed in manuscript among the junior officers, and afterwards printed.

In 1813, under a promise of promotion, of which, however, circumstances prevented the performance, he sailed to Halifax, and was occupied on board the *La Hogue* in cruising in pursuit of Commodore Rogers. In 1816 he obtained a first lieutenancy in the *Niger*, which was stationed off Halifax and the river St. Lawrence and Quebec. Early in 1817 he obtained leave to return to England. When the first expedition of discovery towards the north pole was fitted out, Lieutenant Parry was so strongly recommended to the admiralty, that he was appointed to the command of the *Alexander*, under the orders of Captain Ross in the *Isabella*. It is well known that the sudden resolution of Captain Ross to return to England, adopted in consequence of his supposing that he saw land at the bottom of Lancaster Sound, excited general dissatisfaction. The reasons for believing Captain Ross to have been mistaken were so strong that a second expedition was resolved upon, the command of which was entrusted solely to Mr. Parry, who was allowed to select his own ship, and was consulted as to the appointment of his officers. The ships departed in May 1819, and returned in November 1820, after having penetrated into the Polar Sea as far as the 110th degree of west longitude, and wintered on one of the newly discovered islands. The officers and crews thus became entitled to the parliamentary reward of 5000*l.* In the arduous situation in which he was placed Mr. Parry displayed not merely the skill of an officer but the qualities of a man of talent. The means which he devised to keep the men in health and spirits, by preventing their bodies from sinking into inaction and their minds into listlessness and torpor, were such as to prove him to possess a more than common intellect. On his return he was promoted to the rank of commander. For the manuscript journal of this expedition he received from the publisher 1000*l.* sterling. In 1821, in company with Captain Lyon, he undertook a third expedition to discover a north-west passage, and returned in 1824. Our knowledge of the coasts, bays, and islands of the Arctic ocean has been much extended by his "Journal of a Second Voyage for the Discovery of the North-West Passage, performed in the years 1821, 1822, and 1823, in his

Majesty's ships *Fury* and *Hecla*, together with an appendix containing the natural history," &c. In the summer of 1824 Captain Parry undertook his fourth north-western expedition; and in October 1825 he was obliged to return in the *Hecla*, having lost the *Fury* among the icebergs of the Arctic seas. He had spent the winter, with both his vessels, in Prince Regent's Bay. One of the most important results of these expeditions was the examination of the straits which separate America from Greenland, called Barrow's Straits, in honour of Barrow, the geographer, who planned the voyages. In March 1827 he set out on a fifth expedition with the *Hecla*, intending to advance from Spitzbergen to the pole on sledges; but in October of the same year he returned, without having accomplished his purpose.

PARSONS, JAMES, a distinguished physician, who was born in 1705. He was educated at Dublin, and afterwards studied at Paris. In 1736 he returned to London, where he acquired considerable practice. He died in Red Lion Square in 1770. The following eulogium from the pen of Dr. Maty furnishes a good view of his professional and literary character:—"The surprising variety of branches which Dr. Parsons embraced, and the several living as well as dead languages he had a knowledge of, qualified him abundantly for the place of assistant-secretary for foreign correspondences, which the council of the royal society bestowed upon him about 1750. He acquitted himself to the utmost of his power of the functions of this place till a few years before his death, when he resigned in favour of his friend, who now gratefully pays this last tribute to his memory. Dr. Parsons joined to his academical honours those which the royal college of physicians of London bestowed upon him, by admitting him, after due examination, licentiate, on the first day of April, 1751. The diffusive spirit of our friend was only equalled by his desire of information. To both these principles he owed the intimacies which he formed with some of the greatest men of his time. The names of Folkes, Hales, Mead, Stukeley, Needham, Baker, Collinson, and Garden, may be mentioned on this occasion, and many more might be added. Weekly meetings were formed, where the earliest intelligence was received and communicated of any discovery both here and abroad; and new trials were made to bring to the test of experience the reality, or usefulness of these discoveries. Here it was that the microscopical animals found in several infusions were first produced; the propagation of several insects by section ascertained; the constancy of nature amidst these wonderful changes established. His 'Remains of Japhet,' being historical inquiries into the affinity and origin of the European languages, is a most laborious performance, tending to prove the antiquity of the first inhabitants of these islands, as being originally descended from Gomer and Magog, above 1000 years before Christ, their primitive and still subsisting language, and its affinity with some others. It cannot be denied, that there is much ingenuity as well as true learning in this work, which helps conviction and often supplies the want of it. But we cannot help thinking that our friend's warm feelings now and then mislead his judgment, and that some at least of his conjectures, resting upon partial traditions, and poetical scraps of Irish filids and Welsh bards, are less satisfactory than his tables of affinity between the several northern languages, as deduced

from one common stock. Literature, however, is much obliged to him for having in this, as well as in many of his other works, opened a new field of observations and discoveries. In enumerating our learned friend's dissertations, we find ourselves at a loss whether we should follow the order of subjects or of time; neither is it easy to account for their surprising variety and quick succession. The truth is, that his eagerness after knowledge was such as to embrace almost with equal facility all its branches, and with equal zeal to ascertain the merit of inventions, and ascribe to their respective, and sometimes unknown authors, the glory of the discovery. Many operations which the ancients have transmitted to us have been thought fabulous merely from our ignorance of the art by which they were performed. Thus the burning of the ships of the Romans at a considerable distance, during the siege of Syracuse, by Archimedes, would, perhaps, still continue to be exploded had not the celebrated M. Buffon in France shown the possibility of it, by presenting and describing a model of a speculum, or rather assemblage of mirrors, by which he could set fire at the distance of several hundred feet. In the contriving, indeed, though not in the executing of such an apparatus, he had in some measure been forestalled by a writer now very little known or read. This Dr. Parsons proved in a very satisfactory manner: and he had the pleasure to find the French philosopher did not refuse to the Jesuit his share in the invention, and was not at all offended by the liberty he had taken. Another French discovery, I mean a new kind of painting fathered upon the ancients, was reduced to its real value, in a paper which showed our author was possessed of a good taste for the fine arts: and I am informed that his skill in music was by no means inferior, and that his favourite amusement was the flute. Richly, it appears from these performances, did our author merit the honour of being a member of the antiquarian society, which long ago had associated him to its labours."

PARSONS, PHILIP, a miscellaneous writer, born at Dedham in Essex, early in the eighteenth century. He received a good education, and after entering into holy orders, became curate of Wye. He died in 1812, after having published a number of works, of which the best are his "Essays" and "Astronomic Doubts."

PARSONS, ROBERT, an English Jesuit, born near Bridgewater in 1546. He was educated at Baliol college. He afterwards proceeded to Rome, and became a devoted adherent of that church. We soon find him intriguing against Elizabeth, and after the defeat of the Armada he endeavoured to persuade the Spanish monarch to attempt a new invasion. He died at Rome in 1610. Parsons was the avowed author of more than fifty works.

PARSONS, THEOPHILUS, a distinguished American lawyer, who was born in February 1750, in Byfield, Massachusetts. His youth was assiduously devoted to the study of the Latin and Greek languages, logic, metaphysics, and the mathematical sciences. He studied law in Falmouth, and kept for some time the grammar school in that town. He practised law there a few years; but, in consequence of the destruction of the town by the British, he retired to the house of his father in Newbury. Never was fame more early or more just than that of Parsons as a lawyer. At an age when most of the profession are

but beginning to exhibit their talents, and to take a fixed rank at the bar, he was confessedly, in point of legal knowledge, among the first of his contemporaries. His professional services were generally sought for, not merely in his native county, but in the neighbouring state of New Hampshire and in Boston. Having entered upon business early in the revolutionary war, when the courts of admiralty jurisdiction were crowded with causes, in the management of which he had a large share, he was led to study with diligence the civil law, the law of nations, and the principles of belligerent and neutral rights. In 1806 he was made chief-justice of the court of Massachusetts. The regularity of trials, and the promptness and correctness of decisions throughout the commonwealth, soon attested the beneficial effects of his labours. The first six volumes of the reports of the court in which he presided are a monument of his accurate juridical reasonings, and his deep and extensive knowledge of the common law, and the constitutions and statutes of his country.

In 1779 he became a member of the convention which formed the frame of state government for Massachusetts; and when the constitution of the United States was presented to the people for their approbation, and a convention of delegates from the several towns of Massachusetts was assembled to discuss its merits, and adopt or reject it, Parsons appeared in this assembly, the powerful and zealous advocate of the proposed plan. This finished his political engagements, except some few years in the legislature at subsequent periods, when his influence was visible; but the subjects in which it was exercised were only of ordinary import. In his private character, he was just, regular, punctual, and hospitable without ostentation. Amid the multifarious occupations of his mind, he still found room for the lighter literature, and was ready with his criticism even upon the ephemeral works of fancy and taste. His attainments in classical literature were great. The late Mr. John Luzac, professor of Greek in the university of Leyden, spoke of him as "a giant in Greek criticism," as his professional admirers styled him "the giant of the law." He loved and occasionally cultivated the mathematical sciences. Dr. Bowditch, in his "Practical Navigator," speaking on the subject of lunar observations, of a method of correcting the apparent distance of the moon from the sun, observes that it is an improvement on Witchell's method, in consequence of a suggestion from Judge Parsons. When fatigued with the labour of legal research, he would often amuse himself, as he called it, with mathematical calculations, or relax his mind by the perusal of some popular and interesting novel. He lived to the age of sixty-three years—a long life for such a man, whose mind had been so active, and whose body had seldom been in exercise. He made a public profession of his belief in the Christian revelation: his was the belief of a strong mind, unobscured by superstition, and undisturbed by the apprehensions of death. He died at Boston on the 30th of October, 1813.

PASCAL, BLAISE.—This learned mathematician was born at Clermont, in Auvergne, in 1623, and was the only son of the president of the *cour des aides*, who educated him with great care, and instructed him himself. In early youth he gave proofs of extraordinary talents, and showed a decided inclination for geometry. His hours of relaxation were em-

ployed in the study of mathematics, and his father surprised him engaged in studying Euclid, which he understood without any assistance; and in his sixteenth year the young Pascal wrote a treatise on conic sections displaying great acuteness, but which, notwithstanding the entreaties of his friends, he would not consent to publish. His studies in the languages, logic, physics, and philosophy, were pursued with such assiduity that his health was irrecoverably gone in his eighteenth year. In the course of the next year he invented the celebrated calculating machine, the mechanism of which it cost him much pains to render intelligible to the workmen, at a time when he was hardly free from suffering for a day. In his twenty-third year he made several discoveries concerning the Torricellian vacuum. Before he was twenty-four years old, the reading of some religious works had brought him to the conviction that a Christian must love God only: he therefore laid aside all profane studies, and became more and more deeply rooted in his ascetic opinions, which, however, had been familiar to his childhood. Pascal's piety produced a great effect on his whole family. His father became his pupil, and his sister a nun in the Port Royal. Pascal, although constantly sick, continued to practise his penances with additional rigour. By the direction of his physician, he went into society; but his sister soon induced him to renounce all intercourse with the world, and to give up all superfluities, even at the expense of his health. In this manner he lived from his thirtieth year till his death. After spending some time in a monastery he retired to an estate in the country, denied himself every indulgence, made his own bed, ate in the kitchen, and allowed himself to be served only when it was indispensably necessary. He spent his time in prayer and in reading the Scriptures (which he thus learned by heart), and commentaries on them. His disease, meanwhile, became aggravated, and he died in 1662, at the age of thirty-nine. Pascal had a powerful mind. He had conceived a work on the Christian religion, the object of which was to show its excellence, from a consideration of human nature as well as on historical grounds. The fragments, which were written down during the last four years of his life, and published under the title of "*Pensées sur la Religion*," show the hand of a master. His "*Provinciales, ou Lettres écrites par Louis de Montalte à un Provincial de ses Amis*," is a most bitter satire upon the lax morality of the Jesuits, whose influence was more affected by it than by the most violent attacks of their declared enemies. These letters are esteemed a model of the didactic epistolary style in French literature.

Of the character of Pascal, the abbé Bossut, who collected and edited his works, has left the following interesting notice:—"This extraordinary man inherited from nature all the powers of genius. He was a geometrician of the first rank, a profound reasoner, and a sublime and elegant writer. If we reflect that in a very short life, oppressed by continual infirmities, he invented a curious arithmetical machine, the elements of the calculation of chances, and a method of resolving various problems respecting the cycloid,—that he fixed, in an irrevocable manner, the wavering opinions of the learned respecting the weight of the air,—that he wrote one of the completest works which exists in the French language,—and that in his 'Thoughts' there are passages, the depth and

beauty of which are incomparable,—we shall be induced to believe that a greater genius never existed in any age or nation. All those who had occasion to frequent his company in the ordinary commerce of the world acknowledged his superiority; but it excited no envy against him as he was never fond of showing it. His conversation instructed without making those who heard it sensible of their own inferiority, and he was remarkably indulgent towards the faults of others. It may easily be seen, by his 'Provincial Letters,' and by some of his other works, that he was born with a great fund of humour, which his infirmities could never entirely destroy. In company he readily indulged in that harmless and delicate railery which never gives offence, and which greatly tends to enliven conversation: but its principal object was generally of a moral nature. For example, ridiculing those authors who say, 'My book, my commentary, my history;' 'they would do better,' said he, 'to say our book, our commentary, our history, since there are in them much more of other people's than their own.'" We add one more remark of this wonderful man, which we think is rather happily selected from his writings, to illustrate the chief characteristics of his style of thinking and writing, viz., ingenuity and profundity:—"It seems," says he, "rather a fortunate circumstance that some common error should fix the wanderings of the human mind. For instance, the moon is supposed to influence the disorders of the human body, and to cause a change in human affairs, &c., which notion, though it be false, is not without its advantage, as men are thereby restrained from an inquiry into things to which the human understanding is incompetent, and from a kind of curiosity which is a malady of the mind."

PASQUIER, ETIENNE DENIS, COUNT, an able French minister, who was born in April 1767, and, like his ancestors, embraced the profession of the law; previous to the revolution he was a counsellor of the parliament of Paris. He seems to have lived in retirement during the republic; but Napoleon appointed him master of requests in 1810, baron, and officer of the legion of honour, and, in the same year, prefect of police. After March 1814 the king named him minister of state and director-general of roads and bridges. He remained without employment during the hundred days, but, on the second return of the king, was appointed minister of justice, keeper of the seals, grand-cordon of the legion of honour, and privy-counsellor. He was elected member of the chamber of deputies; reported the project of the law against seditious language; voted in 1816 for the law of amnesty, and distinguished himself as the zealous defender of the ministry. He was chosen president of the deputies, and held the office till January 1817, when he was again appointed keeper of the seals, and remained in that office till December 1818. When Decazes was made president of the council, Pasquier was appointed minister for foreign affairs, and, in the session of 1819, he brought forward and defended the new electoral system and the other laws intended to narrow the liberty of the French. Notwithstanding his services on this occasion, and in many subsequent struggles between the court party and the advocates of liberty, M. Pasquier had, when the ultra-royalist administration was formed towards the latter end of 1821, ceased to become a minister, but was created count, and raised to a seat in the house of peers. From this time Count Pasquier

ranged himself on the constitutional side, and defended the rights secured by the charter with a zeal and eloquence worthy of a better success. After the last revolution he was created chancellor of France.

PATERCULUS, CAIUS VELLEIUS, an ancient Roman historian, who was born, in the year of Rome 735, of a family in Campania, which had borne various important offices in the state. He served under Tiberius in Germany, as commander of the cavalry, and in the first year of that emperor's reign was nominated pretor. Nothing further is known of him; but the praises he bestowed upon Sejanus have led to a supposition that he was a partisan of that minister, and involved in his ruin. His death is placed by Dodwell in the year of Rome 784, in his fiftieth year. Paterculus composed an abridgment of Roman history in ten books, of which the greater part has perished, and unfortunately that which remains is incurably corrupted, only one manuscript having been discovered. His style is pure and elegant, and he excelled in a brief and forcible manner of drawing characters; but his connexions with Tiberius and Sejanus rendered him an adulator of those detestable persons, and warped his representations of the actions and characters of the republican party.

PATTISON, WILLIAM, an English poet, who was born in 1706, and died before he had attained his twenty-first year. Some authors say that he was starved to death, but it is probable that this is not altogether the fact as he was labouring under small-pox at the time of his decease, but he had previously endured great privations. Mr. Pattison's poems were published in two volumes octavo.

PATRICK, RICHARD, an English philological writer, who is principally known by his "Chart of the Ten Numerals, in Two Hundred Tongues, with a Descriptive Essay." He also published a descriptive poem entitled "The Death of Prince Bagration," and several minor works. His death took place in 1815.

PATRICK, SAMUEL, a learned English critic, who published several very useful works relating to classical literature. One of the best of these works was his "Clavis Homerica seu Lexicon Vocabulorum Omnium quæ continentur in Iliade et Potissima Parte Odysseæ." He died in 1748.

PATRICK, SIMON, a distinguished theological writer, who was born at Gainsborough in 1626. He was educated at Cambridge, and elected master of Queen's college in 1661. During the plague of London he remained in the active performance of his duties at the church of St. Paul's, Covent Garden. A letter written at this period shows the pious tenour of his feelings. 'The good pastor says,—"I suppose you think I intend to stay here still; though I understand by your question you would not have me. But, my friend, what am I better than another? Somebody must be here; and is it fit I should set such a value upon myself as my going away and leaving another will signify? For it will in effect be to say, that I am too good to be lost, but it is no matter if another be. Truly, I do not think myself so considerable to the world; and though my friends set a great price upon me, yet that temptation hath not yet made me of their mind; and I know their love makes me passe for more with them than I am worth. When I mention that word, love, I confess it moves me much, and I have a great passion for them, and wish I might live to embrace them once

again; but I must not take any undue courses to satisfy this passion, which is but too strong in me. I must let reason prevail and stay with my charge, which I take hitherto to be my duty whatever come. I cannot tell what good we do their souls; though I preach to those who are well and write to those who are ill (I mean, print little papers for them which yet are too big to send you by the post); but I am sure while I stay here I shall do some good to their bodies, and perhaps save some from perishing; which I look upon as a considerable end of my continuing. My dear friend, do not take it ill that I cannot comply with your desires in this thing; you see what sways me, and I know you will yield to it, and say it ought to be stronger than the love of you. If you can convince me that I may with a good conscience go, you may think it will be acceptable; but I know not upon what grounds you will make it good. Try if you have a mind."

In 1672 he was made prebendary of Westminster, and published a series of *Controversial Tracts* in the reign of James II., whose arbitrary designs he opposed. At the revolution he was made bishop of Chichester, and afterwards translated to Ely, in which see he died May 31, 1707. Bishop Patrick's most celebrated work is his "*Paraphrases and Commentaries on the Bible*."

**PAUL.**—This apostle was born of Jewish parents, at Tarsus, in Cilicia, and inherited the rights of a Roman citizen. He received a learned education, and early went to Jerusalem to study under Gamaliel, one of the most celebrated Jewish rabbins in the time of our Saviour, who instructed him in the Jewish laws and traditions. He was also well acquainted with the Greek poets and philosophers, as his *Epistles* show, and learned a trade (probably that of a maker of tents and hangings), according to the custom of the Jewish teachers, by which he afterwards supported himself in his travels. Thus prepared for the office of teacher, he joined, a few years after the death of Jesus, the sect of the Pharisees, and became a persecutor of the Christians; to crush whom the sanhedrim employed him both in and out of Jerusalem. The *Acts of the Apostles* contains several instances of the heat of his zeal in this cruel work, upon which he entered from his attachment to the law of his fathers. He was even on his way to Damascus with full power from the chief priests to arrest the Christians, when he was led by a miracle to view Christianity in a different light, and to seek a personal knowledge of the excellence of the religion from the instructions of Christian teachers. This sudden conversion, effected by the divine interposition, was indicated by the change of his name from Saul to Paul, and he engaged in the work of an apostle with an ardour that overcame every difficulty. Arabia, Syria, Asia Minor, Greece, and the islands of the Mediterranean, were the scenes of his unwearied activity in promulgating the doctrines of Christianity. In all his journeys he laboured to establish new churches and to confirm the faith of those already existing. He made himself useful to the churches of Antioch, Ephesus, and Jerusalem, by instructing them, by arranging their ceremonies, and collecting alms for the poorer members. The churches of Philippi in Macedonia, of Corinth, Galatia, and Thessalonica, honoured him as their founder; and the *Epistles* in the New Testament, which he wrote to these churches, and to the churches in the chief cities of

Greece and Asia Minor, and to Rome, show the paternal relation in which he stood to them and the paternal care which he exercised over them. By admitting the Gentiles to a participation in the blessings of Christianity without requiring them to submit to the Jewish rites, he promoted the progress of Christianity far more than the other apostles, who at first baptized none but their own countrymen. But this conduct exposed him to the hatred of the Jews, who persecuted him as an apostate; and every thing at Jerusalem was prepared for his destruction. In the sixtieth year of the Christian era, after labouring with unwearied zeal for more than twenty years to spread the doctrines of Jesus, he boldly went to Jerusalem with the money which he had collected for the support of the oppressed Christians in Palestine. He was there arrested and brought to Cæsarea, where he was kept a prisoner for two years by the Roman governors, Festus and Felix.

The fearless spirit with which he explained his whole conduct excited the same admiration which had been produced in the Areopagus and among the wise men of Athens (where Dionysius, the Areopagite, became one of his adherents) by his enthusiastic eloquence. Having been illegally imprisoned he appealed, as a Roman citizen, to the emperor, and was sent to Rome. He was shipwrecked at Malta, and in the spring of the year 62, arrived at the capital of the world. He was treated with respect, but as a prisoner of state, and gained over many distinguished Romans to the Christian faith. It is certain that he was set free in the year 64, but the account of his further travels in Spain, Britain, Macedonia, Greece, and the borders of Asia, is founded solely on conjecture. In the year 66 Paul returned to Rome, was again arrested, and died the death of a martyr. The history of no apostle is so rich in remarkable events, hardships, and sufferings, as that of this great man. Even the enemies of the religion for which he lived and died could not deny the gifts of his mind, his deep and extensive knowledge, profound understanding of the nature of religion, richness and acuteness of thought, and a talent for teaching, which combined elegance, perspicuity, and fervour.

**PAUL I.**, emperor of Russia.—This monarch was a son of Peter III. and Catharine II., and was born in 1754. His father, on account of his dislike of Catharine, would not acknowledge his legitimacy, but on the death of Ivan in 1763 he became the sole remaining heir to the crown, and was placed under the care of Count Panin and Æpinus. His mother treated him with great rigour, and kept him constantly estranged from public affairs during her life. In 1773 he married a princess of Hesse-Darmstadt, who died soon after, and in 1776 he married a princess of Wurtemberg, who became the mother of the late emperor Alexander, the late prince Constantine, the emperor Nicholas, and the grand-prince Michael, and several daughters. In 1780 he travelled, with his wife, under the title of count of the North, in Poland, Germany, Italy, France, and Holland, and after his return retired to his usual place of residence the palace of Gatschina, and was permitted to take part neither in civil nor military affairs.

On the death of Catharine in 1796 the prince was finally released from his long restraint; and the first acts of his government, after performing the obsequies of his mother and paying the last honours to his father, were dictated by benevolent intentions.

He put an end to the war with Persia, and liberated the Poles who were in confinement in Russia. But the severe treatment to which he had been subjected for forty years had exercised a most injurious influence upon his character, and, combined with the natural violence and impetuosity of his temper, led to those acts of despotism and folly which stain his reign. He joined the coalition of crowns against France, and sent 100,000 men, partly under Suwaroff and Korsakoff to Italy and Switzerland, and partly to Holland. The Russian arms were at first successful; but, after the defeat at Zurich, his increasing distrust of the English and Austrian courts, and the artful management of General Bonaparte, who dismissed the Russian prisoners newly clothed and armed, and insinuated new suspicions into the mind of the czar, broke off his connexion with the coalition. Louis XVIII., who had been received into the Russian territory with every mark of attention, and the French emigrants, were ordered to quit the country. Paul had caused himself to be declared grand-master of the knights of Malta, after the resignation of that dignity by the baron Hompesch; but England, having conquered the island in 1800, refused to surrender it to the Russian emperor. Paul therefore laid an embargo on all English ships in the Russian ports, and prevailed upon the Swedish, Danish, and Prussian courts to enter into a convention for the protection of their commerce against the encroachments of the English by sea. His internal administration was characterized by similar traits of impetuosity, and, in many cases, of tyranny. His innovations in the army (particularly the introduction of hair-powder and queues); his prohibition against the wearing of round hats, pantaloons, &c.; his order obliging all persons who met him in the streets to leave their carriage and prostrate themselves before him, and other acts of a similar nature, excited general discontent. Other measures, of a more serious character, finally produced a conspiracy among the nobles. They excited mutual suspicions between Paul and his sons, and Alexander finally consented to assume the government until the mind and health of his father were restored. The conspirators entered the antechamber of the emperor in St. Michael's palace, at eleven o'clock at night, on the 11th of March, 1801, by a secret passage, and the door to the emperor's chamber was opened by the guard, who was deceived by an alarm of fire. An act was then read to him, by which he was to acknowledge himself incapable of conducting the government and surrender it to Alexander. Paul cried out, "I am emperor, and will remain so;" and he was then despatched by the conspirators. Some accounts say that he was strangled in his bed with his own sash. In the Russian manifesto on the subject his death was ascribed to apoplexy.

**PAUL OF VENICE, FATHER**, a celebrated ecclesiastic and historian of the sixteenth century, whose proper name was Pietro Sarpi. He was born at Venice in August 1552, and was the son of a merchant of that city. He entered young into the religious order of the Servites, in his twentieth year was appointed chaplain to the grand-duke of Mantua, and lecturer on the canon law. After two years he returned to Venice, and became provincial of his order. He was afterwards made procurator-general of the Servites. A treacherous correspondent having betrayed a letter of Father Paul in which he had observed that, so far from coveting the dignities of the

court of Rome, he held them in abomination, brought on him the imputation of being a heretic, while his liberal intercourse with eminent protestants contributed to increase the prejudices thus excited. In a dispute between the pope and the Venetian government on the subject of ecclesiastical immunities, Father Paul showed himself a strenuous advocate for the cause of liberty, and was summoned to Rome, on pain of excommunication, to answer for his conduct; but the affair was compromised.

To the vengeance of his political enemies may be attributed an attempt to assassinate him in 1607, on which occasion he received many dangerous wounds from a band of ruffians. Father Paul employed the latter part of his life in writing the history of the council of Trent, in which he has developed the intrigues connected with the transactions of that famous assembly with a degree of boldness and veracity which renders the work one of the most interesting and important productions of the class to which it belongs. The labours of Father Paul extended to various branches of knowledge; he was deeply skilled in the canon law, and distinguished for his acquaintance with anatomy. He appears to have discovered the valves of the veins which contribute to facilitate the circulation of the blood. He died on the 14th of January, 1622, and is said to have expired after uttering the words *Esto perpetua*, which have been construed as a prayer for the prosperity of Venice. The history of the council of Trent was first published in London in 1619, having been transmitted to this country through the medium of the English resident at Venice, Sir Henry Wotton, a personal friend of the author.

**PAUL THE DEACON, or PAULUS DIACONUS**, was born at Friuli in the eighth century, and educated in the court of the Lombard kings at Pavia. On the capture of Desiderius, the last king of the Lombards, by Charlemagne, he retired to the monastery of Monte Casino, where he took the habit. He wrote a history of the Lombards; and, as he was an eye-witness of many of the events he mentions, his statements are held to be generally correct.

**PAUL, ST., VINCENT DE.**—This ecclesiastic was the founder of the priests of the mission. He was born in France in 1576, and studied at Toulouse, and having been captured by the Turks remained a considerable time in slavery, during which he converted his master. On his return to France he became parish priest at Clichy, and by the aid of a rich and pious lady founded a congregation of missions, the members of which were devoted to preaching to the poor, and performing other acts of benevolence and mercy. Their chief seat was the religious house of St. Lazarus at Paris, whence they were called Lazarites. Vincent de Paul died in 1660, and was canonized in 1737.

**PAULUS, HENRY EBERHARD GOTTLOB**, a distinguished German theologian, who was born in 1761 at Leonsberg, near Stuttgart. He studied theology at Tübingen and devoted himself with much zeal to the oriental languages. In 1789 he was appointed professor of the oriental languages at Jena, after having travelled in Germany and England. Here he was occupied entirely with the study of the Old and New Testament and wrote his "*Commentar des Neuen Testaments*." He endeavoured to ascertain the original meaning of the Old Testament from a consideration of the times in which the parts were

written, as his "Clavis" on the Psalms and Isaiah prove. In 1794 he was appointed to one of the chairs of theology. In 1803 he accepted an invitation to Würzburg, where his consistorial labours prevented him from pursuing his literary researches, and after some time, when the protestant faculty in Würzburg was abolished, he was appointed a counsellor of ecclesiastical affairs and public instruction in Bamberg, Nuremberg, and Anspach successively. At length he was restored to the academic life by being appointed professor of exegesis and ecclesiastical history in the university of Heidelberg.

In 1819 he established his "Sophronizon"—an historical and political periodical for the service of church and state. It was received with great applause both by catholics and protestants. The university of Freiburg gave him the degree of doctor of laws in consequence of his critique on the famous process of Fonk. In 1825 he began a theological periodical—"Der Denkglaube," and in 1827 another periodical—"Kirchenbeleuchtungen." In the latter he strove to show the true state of the Roman catholic and protestant churches; in the former the harmony of reason with the doctrines of primitive Christianity, which was the aim of all his inquiries.

PAUSANIAS, a Greek topographical writer, who flourished during the reigns of Adrian and the Antonines. He was a native of Cæsarea in Cappadocia, and studied under the celebrated Herodes Atticus. He taught at Athens and afterwards at Rome, where he died. His account of Greece, a kind of journal of his travels, in which he describes every thing remarkable—temples, theatres, tombs, statues, pictures, monuments of every sort, &c.—is a valuable work for the antiquarian. His style is sometimes careless and sometimes affectedly formed on more ancient writers, and the work is full of fables which are connected with the objects that he describes. For this reason Scaliger called him *Græculorum omnium mendacissimus*; but the fullest confidence may be put in Pausanias where he speaks as an eye-witness.

PAUSANIAS, a Lacedæmonian general, son of Cleombrotus, and nephew of Leonidas. He was appointed guardian of his cousin Plistarchus, the son of Leonidas, during his minority; and in this capacity was at the head of the government during the absence of the other king. When Mardonius invaded Greece with a large army of Persians, Pausanias marched against him as general of the allied forces of Greece, deceived his enemy by a feigned retreat, and totally defeated him in the battle of Platæa. He then advanced to Thebes, which had deserted the cause of Greece, compelled the inhabitants to surrender the leaders of the Persian party, and caused them to be executed. His moderation, which had been admired during the campaign against Mardonius, now gave way to arrogance and overbearing impetuosity. To himself alone he ascribed the victory at Platæa, and offered a golden tripod in the temple of Apollo at Delphi, with an inscription representing himself as the sole conqueror. He became still more insupportable after having, at the head of the allied Greek fleet, delivered the Grecian cities, and after a long struggle Cyprus also, and, finally, Byzantium itself, the key of Asia Minor, from the Persian yoke. While Aristides and Cimon, who commanded under him, won the hearts of all by their affability, Pausanias abused the allies, and considered the Spartans as the ruling nation among the Greeks.

At length he entered into secret negotiations with Xerxes and conceived the design of making himself master of Greece. He restored to Xerxes without ransom many distinguished Persians, who had been taken prisoners at Byzantium, openly renounced the manners and customs of the Spartans, adopting Persian habits and the Persian costume, and carried things so far that the disgust of the allies could no longer be suppressed. The Spartans summoned him home, but hardly was he acquitted in consideration of his rank and services, when he betook himself again to Byzantium under the pretence of taking part in the campaign. Being compelled by the Athenians to leave the city, he went to Colonæ in Troas, and entered into fresh negotiations with the enemies of Greece. He was once more recalled and imprisoned, but notwithstanding the charges against him, was again liberated under promise to appear whenever he should be summoned. But he entered into new negotiations with the Persian king. To secure himself against detection he had obtained from Artabazus a promise to put to death the bearers of his letters. The suspicions of Argilius whom he sent on this errand being awakened, he opened the letter intrusted to him, found his suspicions confirmed, and gave information of the fact to the ephori. In order to procure full proof they directed Argilius to take refuge in the temple of Neptune at Tænarus, as if fearing for his life. As soon as Pausanias heard of the circumstance he hastened to meet him. They entered into a conversation which disclosed to the ephori, who were concealed in the place, the guilt of Pausanias. The ephori now returned to Sparta determined to punish him according to the rigour of the law. Pausanias, having been informed on the way of the fate which awaited him, took refuge at the feet of Minerva Chalciæcus. But his indignant mother brought the first stone to close the entrance of the temple. The people followed her example, and the unhappy prisoner, being thus walled up, died of hunger.

PAZZI, one of the richest and most distinguished families in the Florentine republic, which was celebrated for its connexion with the conspiracy of 1478, of which it became the victim. Jealousy of the power of the Medici combined with the jealousy of a disappointed lover to inflame Francis Pazzi, the author of the conspiracy, against Julian of Medici, his rival, who had privately married Camilla Cafarelli. Francis Pazzi, rash, haughty, and vindictive, resolved to avenge this offence, and the humiliations of his family, by the destruction of the Medici. Bernard Bandini, who also hated the Medici, was his first confidant. Aware that the increasing power of the Medici was viewed with dislike by the pope, Sixtus IV., they acquainted his son, Jerome Riario, the friend of Pazzi, of their design of assassinating Lorenzo and his brother Julian of Medici, and introducing a new form of government, and wished through him to gain the assistance of the pope. The latter promised his aid, and Francis Salviati, archbishop of Pisa, the enemy of the Florentines and of Lorenzo de' Medici, also joined them. James Pazzi, uncle of Francis, and a peaceful and prudent citizen, was persuaded by Montesecco, the general of the pope, to take part in the conspiracy. While Charles Manfredi, count of Faenza, was sick, the conspirators, without exciting the suspicion of the Medici, collected a number of troops for their defence. They resolved to murder both the

Medici at a festival. Their project was twice frustrated by the absence of Julian; and the 26th of April, 1478, the day in which religious service was to be celebrated in the church of Santa Reparata, was next fixed upon for the execution of their designs. The sound of the bell at the moment the priest raised the host was to be the signal; but as the time approached, Montesecco refused to pollute the sacred place. The work was now committed to Anthony of Volterra, and Stephen, a priest. Lorenzo and a large number of people were already assembled in the church, but Julian was not present. Francis Pazzi and Bandini went and persuaded him to attend the mass. On the way to the church they conversed with him in the most friendly manner, and Francis Pazzi several times embraced him, in order to ascertain that he was not clothed in armour. When they arrived at the church they placed him between themselves, and Anthony of Volterra and Stephen stationed themselves by the side of Lorenzo. At the second sound of the bell, Francis Pazzi stabbed Julian with such violence as to wound himself. Bandini murdered Nori, the friend of Julian. Anthony and Stephen attacked Lorenzo, but only gave him a slight wound in the neck. He escaped into the sacristy. Francis and Bandini, who undertook to pursue him, were prevented. Many persons lost their lives in the crowd, and it was with difficulty that the cardinal was defended by the priests from the popular fury. Bandini fled. Francis, after an unsuccessful attempt to rouse the people to insurrection, faint from the loss of blood, was forced to return home. Salvati and James Poggio, at the head of about one hundred Perugians, had proceeded to the palace to take possession of it; but Cæsar Petrucci, the gonfalonier, suspecting their designs, summoned the guards and occupied the upper story. The Perugians were accidentally shut up in a hall which could not be opened from within, and the Florentines easily seized the archbishop and many of the conspirators. Some of them were killed on the spot; others were hanged from the windows, and afterwards thrown into the streets. The enraged populace seized Francis Pazzi in his house, dragged him naked through the streets, and hanged him, with seventy others, at the windows of the palace. James Pazzi, who was riding through the streets calling the people to arms and liberty, was stoned from the palace of the signoria, and, finding no adherents, fled to the Appennines, where he was recognised by a peasant, carried back to Florence, and hanged with Renatus Pazzi. The people took his body from the family tomb, and threw it into the fields. The corpse was again buried, and again disinterred by the people and thrown into the Arno. Bandini had fled to Constantinople; but he was surrendered by the sultan, Bajazet, and executed with Anthony of Volterra and Stephen, who had fled to a monastery. Napoleon Francesi, and William Pazzi, who was innocent, and was brother-in-law of Lorenzo, both escaped the rage of the populace. But notwithstanding the entreaties of his wife, Bianca, the latter was banished to his villa for life. The former disappeared and was never more heard of. The rest of the family were imprisoned for life in the dungeons of Volterra. Montesecco was beheaded, and the cardinal was sent back by Lorenzo with many apologies to Rome.

PEACHAM, HENRY, a clever English writer, who was born in Hertfordshire about the beginning

of the seventeenth century, and educated at Trinity college, Cambridge. He passed the principal part of his life in Italy studying the fine arts, of which he was a passionate admirer. Among his numerous publications the most popular was "The Complete Gentleman." This work is now obsolete, but it was once much esteemed.

PEALE, CHARLES WILLSON, an ingenious American, who was born of English parents at Chestertown, Maryland, in 1741. He was apprenticed to a saddler, and married at an early age. He successively carried on the trades of saddler, harness-maker, silversmith, watchmaker, and carver; and afterwards, as a recreation from his sedentary practice of portrait-painting, became a sportsman, naturalist, and preserver of animals; made himself a violin and guitar; invented and executed a variety of machines; and was the first dentist in that country that made sets of enamel teeth. At the age of twenty-six he was first excited to become a painter by the desire of surpassing the wretched things which he happened to meet with. At this time Hesselius, a portrait-painter from the school of Sir Godfrey Kneller, was living near Annapolis. Mr. Peale, selecting the handsomest saddle his shop afforded as a present to the artist, introduced himself, and solicited the favour of seeing for the first time the mysterious operations of painting. Mr. Hesselius gave him essential instruction, and he afterwards received similar services from Mr. Copley, on a visit to Boston. Soon after, by the aid of his friends, he came to England, and studied during the years 1770 and 1771, in the royal academy at London under the direction of Mr. West. The following singular anecdote of Mr. Peale is related by Colonel Trumbull. He says that one day when he was in Mr. West's painting-room some hammering arrested his attention. "Oh," said Mr. West, "that is only that ingenious young man, Mr. Peale, repairing some of my bells or locks, according to custom." This custom, much to the comfort and amusement of many a host, he continued all through life, whenever he was on a visit in the country either for business or pleasure.

On his return to America he removed to Baltimore, and afterwards to Philadelphia, where he opened a picture-gallery. For about fifteen years he was the only portrait-painter in North America, and persons came to him to be painted even from Canada and the West Indies. During the revolutionary war he raised a company, was often employed in confidential services, and was engaged in the battles of Trenton and Germantown. In 1777 he was elected a representative of Philadelphia in the state legislature, where he chiefly interested himself in the law for the abolition of slavery. During the revolutionary contest he had painted the portraits of many distinguished officers, some of whom were afterwards killed. This collection constituted the chief interest of his gallery, and was from time to time extended, and afterwards made to comprise the portraits of men eminent in the different walks of life. Some large bones of the mammoth, found in Kentucky, and brought to him to be drawn, laid the foundation of his museum, when the name of museum was scarcely known even to our American travellers, and Europe possessed none of great note but the celebrated Aldobrandine collection at Florence. The increasing income from his museum at length enabled Mr. Peale to procure almost an entire skeleton of the mammoth. A large quantity of the

bones of an individual of this species was discovered in Ulster county, New York, which Mr. Peale purchased, together with the right of digging for the remainder in a swampy marl-pit, which was obtained after very great exertions. Natural history as yet formed no part of the education of youth, and Mr. Peale was the first to prepare and deliver a course of lectures on this interesting and now popular subject, which he rendered attractive to the young Americans by demonstrations with the real subjects taken out of the museum. He was foremost in the early attempts to establish an academy of the fine arts. When the Pennsylvania academy of the fine arts was founded, he zealously co-operated for many years, and lived to contribute to seventeen annual exhibitions. After a life of extraordinary exertion and temperance, he died in 1827, at the age of eighty-five.

PEARCE, NATHANIEL.—This celebrated English traveller was born at East Acton, in Middlesex, about the middle of the last century. He went to sea at an early age, and afterwards resided for many years in Abyssinia. We are inclined to consider Nathaniel Pearce as the person who, next to Bruce, has done most to throw light upon the recent state of that country. He is deficient in that scientific and literary culture which enabled the latter to give a comprehensive, systematic character to the information he conveyed, but he is far his superior in natural shrewdness and accuracy of memory. Mr. Pearce was first known by his contribution to Mr. Salt's travels. His next work was equally valuable. In the form of a journal, it conveys in a desultory, but not harassing manner, a tolerable correct notion of the state of parties, and the progress of the country, from the death of Ras Michael to the death of Ras Welled Selassé. The character of the former virtual sovereign of Abyssinia is well known from Bruce. The character of his successor, in the important and anomalous dignity of Ras, affords a most pleasing contrast to that energetic tyrant. His bravery and kindness of heart, his noble struggles to raise himself above the ignorance and superstition of his time and country, render him one of the most attractive pictures of a great and good man amid a degraded race that we have met with. His hopeless conflicts with the Abuna (head of the Ethiopian church) are interesting, both as they tend to evolve his own character, and to show to what lengths of fatuous violence a weak-minded and passionate man may be goaded on by the assumption of priestly power. The conduct of the better class of the Abyssinian leaders shows beautifully how naturally well-balanced minds, even when unable to distinguish between superstition and true religion, feel, by an innate tact, the true province of the latter, and vindicate the rights of their moral nature, without rejecting the belief in which they have been bred up.

A fair specimen of Mr. Pearce's style as a narrator will be found in the following extract from his "Journal":—"On returning to Ozoro Duster, I pretended to believe all I had seen and heard of the king-snake, as I knew it would be folly to argue with such superstitious people. What made the joke better was, that when we were talking on the same subject at the Ras's, there happened to be an old man, a servant to the head negade of the Ras's at Adowa, who had come with some money to the Ras, and on his hearing the story, he told the Ras, that when

he was a boy, and had not been long bought by his master, Buggerund Yanne, a Feringee, came to his master's house, of the name Yagoube, and his master told Yagoube about this snake being still alive, and living in the rocks near Axum, and that it used to come out of its den in the night, upon which Yagoube swore he would shoot him if Yenne would give him a guide. The lad was accordingly sent with some other boys, the former carrying Yagoube's double-barrelled gun, and plenty of powder and shot. When they came to the spot, they watched until they all went to sleep except the servant lad, when two large gibs, hyenas, came grunting and fighting together; the lad cried out, 'Sidi Yagoube! Sidi Yagoube!' The rest, being suddenly awakened, and hearing the growling of the hyenas, thought that the noise they heard was the snake devouring Yagoube; so they set off, and never stopped until they got within the churchyard of Axum, leaving him and Yagoube's only servant to search for him, but they saw no snake. After what had happened, Yagoube was ashamed to go into Axum, as the priests had heard that he was killed by the snake, and they would have been angry with him for pretending to do as he wished. The party therefore returned to Adowa, and Yagoube obtained leave to take the boy with him to Gondar, and to the Essneer Abby Subkulla, where he remained with him until he went to Sennaar. The boy and some others went with the Feringee as far as Ras-el-feel, and, as he gave them good wages, they wished to have gone with him, but he would not take them. The old man who told this story was named Sasenas, formerly a Galla slave to Buggerund Yanne, a Greek, Ras Michael's treasurer." Mr. Pearce, after he left Abyssinia, proceeded to Cairo, and collected a great number of antiquities, with the intention of transferring them to the British museum, but died at Alexandria in 1820.

PEARCE, ZACHARY, an English prelate, who was born in 1690, and received his education at Trinity college, Cambridge. Having entered holy orders, he rose rapidly in the church, and was finally raised to the see of Rochester. He was distinguished for his piety and munificence, and died much regretted in 1774. He was the author of "A Commentary on the Gospels and the Acts," and several other valuable works.

PEARSON, GEORGE, a distinguished physician and physiologist, who was born at Rotherham in 1751. He studied medicine both at Edinburgh and Leyden, and early in life became physician to St. George's hospital. Dr. Pearson died in 1828. His published contributions to science were very numerous, too much so indeed to be particularly enumerated; but the following extract from the "eulogium" by the president of the royal society will convey a general notion of their value:—"Another distinguished member of this society has recently been taken from us by one of those accidents, common, indeed, to old age, yet of a nature to excite compassion, or feeling, perhaps, of a stronger cast. Dr. George Pearson was elected in June, 1791, and has enriched our transactions with ten communications. The first, in the year of his admission, on Dr. James's antimonial powders. The composition of this celebrated febrifuge having been long withheld from the public, notwithstanding the sworn specification of its inventor, a great anxiety was naturally felt for discovering the secret. This Dr. Pearson effected, having proved by analysis,

and by the re-union of the constituent parts, that antimony and phosphate of lime made up the whole mass. Some slight difference may still exist between the concerted medicine and any other that can be produced, arising probably from peculiar and possibly accidental and unimportant manipulations; but no doubt can be entertained as to the essential ingredients. The second, in 1792, on the composition of fixed air. The third, in 1794, on a peculiar vegetable substance, imported from China. The fourth, in 1795, on the nature and properties of Wootz iron and steel made in the East Indies. The fifth, in 1796, in a paper equally interesting to the natural philosopher and to the antiquary, since it ascertains the composition of metallic weapons belonging to times the most remote, and confirms the opinion, derived from classical authority, of their being made from an alloy of copper and tin. The sixth, in 1797, on the nature of gas produced by passing electric sparks through water. This communication must be highly esteemed, since it tended, at that early period, strongly to confirm the great discovery of Mr. Cavendish—the decomposition of water; a discovery of the utmost importance, but requiring every possible confirmation, as it went in direct opposition to the decided opinions and the prejudices of many hundred years. We are become familiar with hydrogen, with oxygen, with the compound nature of liquids, and the changes of form produced on bodies by the agency of heat. The speculative philosophers of antiquity, on the contrary, mistaking varieties of form for real differences of substance, arranged all physical nature under four classes,—denominating solid bodies, or the principle of solidity, earth; liquid bodies, under a similar hypothesis, water; and the principle of elasticity, air; fire, or heat, occupied the fourth division: and to these was added a fifth, or quintessence,—the substance endowed with consciousness, with thought, and with the power of originating motion. It is obvious that ice, water, and steam, to ratify this arrangement, must possess three distinct essences; yet such is the power of habitual attachment to opinions never before questioned, that had Mr. Cavendish, the scientific ornament of our country and of his age, lived some centuries before our time, he might, perhaps, have experienced a common fate with the philosopher who maintained the revolution of the earth and the central position of the sun. The seventh, eighth, and ninth communications, in subsequent years, are strictly professional; and the tenth, in 1813, also medical, relates to a black colouring matter occasionally found in the bronchial glands. But Dr. Pearson has still further claims on our respect and our regard. For a series of years he continued to diffuse, by his lectures, a knowledge of the new chemistry; instructing hundreds in the truths of science, as they became successively developed, in a manner not calculated to load the memory, but to invigorate the reasoning powers, in proportion as new facts were communicated and arranged."

PEARSON, MARGARET.—This lady was long celebrated for her exquisite works in stained glass. Two sets of paintings from the cartoons of Raphael were exhibited in succession in London, and obtained universal admiration. A third set she finished in 1821, and in consequence of the application and confinement, produced a complaint which terminated her existence. This set is considered as surpassing

the former; she has likewise left behind many smaller pieces, sufficient to secure her immortality in the annals of the art. This lady was the daughter of Samuel Paterson, the well known bibliographer, and very early in life exhibited a predilection for the fine arts. She died February 14th, 1823.

PEARSON, JOHN, an English divine who was born at Snoring in Norfolk, and received his education at King's college, Cambridge. Having received several good church preferments, he was finally raised to the vacant see of Chester, over which diocese he continued to preside till his death, which took place in 1686. He is best known as an author by his celebrated "Exposition of the Creed."

PEARSON, JOHN EDWARD, a learned English divine, who was born on the 25th of October, 1756, and educated at Cambridge. He took his degree of B. D. in 1792, and was shortly after presented to the rectory of Rempstone in Nottinghamshire, and subsequently he obtained the appointment of master of Sidney Sussex college, Cambridge. His death took place suddenly on the 17th of August, 1811. He was the author of several theological works.

PECK, FRANCIS, a learned antiquarian writer, who was born at Stamford in 1692, and educated at Trinity college, Cambridge, where he took his degree of M. A. in 1727. Having entered holy orders, he obtained the rectory of Godeby in Leicestershire, which was the only church preferment he ever received. His death took place in 1743. He was the author of several valuable works; the principal of which are, his "Desiderata Curiosa," his "Academia Tertia Anglicana," and "A Complete Catalogue of all the Discourses written both for and against Popery in the Reign of King James II.," &c.

PECKHAM, JOHN, an early English prelate, who was born in Sussex in 1240. He took his degree at Oxford, and in 1278 the pope consecrated him archbishop of Canterbury. He died at Mortlake in 1292. His principal literary works are, "Collectanea Bibliorum Libri Quinque," and "Perspectiva Communis."

PEDRO I., ANTONIO JOSE D'ALCANTARA, DON, emperor of Brazil, son of John VI., king of Portugal, and elder brother of the usurper Miguel. He was born at Lisbon, October 12th, 1798, and, in 1808, was taken, with the rest of the royal family, to Brazil. The character of Don Pedro was thus drawn by a writer in 1820:—"In other respects, as well as in this particular (the grant of a constitution to Portugal), his measures indicate that he is no ordinary man. Tyrant as he is it would seem that in establishing his monarchy in the new world, he ceased to partake of the incapacity which marks so many of the royal families of Europe. The blood of Braganza is regenerated on American soil. Pedro is reputed to be conversant with science and the arts more than is becoming in a legitimate prince. He is dissolute in his morals, it is true, and cruel in his temper; but, on the other hand, he is brave and careless of danger, and zealously watches, in person, over the concerns of his army and navy with an energy deserving a better cause. Highly gifted in personal appearance, he adds to it an enterprise of action, vigour of intellect, and robustness of constitution, which well qualify him for the high part which he sustains in the political drama of South America." At an early age he conceived a strong predilection for music, for which he showed a decided talent. He not only learned to play on a variety of instruments, but composed much

of the music for his father's chapel, and has also written and set to music one of the most popular Brazilian songs. On the return of his father to Portugal in 1821, Don Pedro remained in Brazil as prince regent; but, in the next year, Brazil declared itself independent, and the prince assumed the title of emperor. His imperial title was acknowledged in 1825 by John VI., who, dying in 1826, also left him the crown of Portugal. The emperor, however, after granting a constitution to Portugal, resigned the crown to his daughter, Doña Maria, and appointed his sister regent of Portugal. Pedro had married, in 1817, Leopoldine, archduchess of Austria, daughter of the emperor Francis, by whom he had five children, among whom were the princess Doña Maria and Don Pedro II. She died in 1826, a reputed victim of his attachment for the marchioness of Santos, to whom, also, it is said, was owing a change of ministry which took place about that time. His second wife was Amelia, princess of Leuchtenberg.

After the close of the war for the Banda Oriental in 1828, the attention of the emperor was principally drawn to the settlement of Portugal, and to the domestic concerns of the empire, the finances of which were in a very embarrassed condition. The elements of democracy were largely mixed up with imperial principles. The gold and silver of the country had entirely vanished, and there was no currency but paper, which would not circulate beyond the capital, and large pieces of copper, which bore a discount of forty per cent.; and the people were in a high state of excitement lest the extinction of the constitution in Portugal was but a prelude to a similar event in Brazil. These and other circumstances gradually alienated the public mind, and in April 1830 the nation had become divided into the constitutionalists or republicans who were Brazilians, and absolutists who were Portuguese. An attempt, which was made to induce the troops to declare the emperor absolute, failed, and he now, in appearance, embraced the constitutional party. In March 1831, while on a tour in the mining districts, Don Pedro made use of language which offended and alarmed the liberal party, and on his return to Rio there were manifestations of popular excitement in which the troops joined. The rigour which he used on this occasion, and his subsequent vacillation of conduct served at once to thin his own ranks and to increase the disaffection, and revolutionary movements were soon perceptible. Disturbances began April 3rd, and continued for several days; many persons were killed in the attempts to suppress them, and when on the 7th a change of ministry was announced, the people assembled to demand the reinstatement of the old ministers. Don Pedro refused to yield his prerogative of choosing his own advisers; the troops joined in the insurrection, and the next morning the emperor abdicated in favour of his infant son, Don Pedro II., and embarked on board an English ship of war. The deputies appointed a regency, and the new emperor was proclaimed. He subsequently returned to Europe, and succeeded before his death, which took place very suddenly, in placing his daughter on the Portuguese throne.

PEELE, GEORGE, an English dramatist and poet, who was a native of Devonshire. He was educated at Christ Church college, where he was admitted M. A. in 1579. After leaving college he removed to London, became the city poet, and had the ordering of the pageants. He lived on the Bank Side, over

against Blackfriars, and maintained the estimation in his poetical capacity which he had acquired at the university, which seems to have been of no inconsiderable rank. He was a good pastoral poet; and Wood states that his plays were not only often acted with great applause in his life-time, "but did also endure reading, with due commendation, many years after his death." He speaks of him, however, as a more voluminous writer in that way than he appears to have been, mentioning his dramatic works by the distinction of tragedies and comedies, and has given us a list of those which he says he had seen; but in this he must have made some mistake, as he has divided the several incidents in one of them, namely, his "Edward I.," in such a manner as to make "The Life of Llewellyn" and "The Sinking of Queen Eleanor." He moreover tells us, that the last-mentioned piece, together with a ballad on the same subject, was in his time usually sold by "the common ballad-mongers." About 1593 Peele seems to have been taken under the patronage of the earl of Northumberland, to whom he dedicated, in that year, "The Honour of the Garter, a poem gratulatorie, the Firstling, consecrated to his noble name." He was almost as celebrated for his tricks and merry pranks as Scoggin, Skelton, or Tarleton; and as there are books of theirs in print, so there is one of his called "Merrie Conceited Jests of George Peele, gent. sometime student in Oxford; wherein is showed the course of his life, how he lived; a man very well known in the city of London and elsewhere." He died in poverty; the usual lot of ill regulated genius in 1598.

PEGGE, SAMUEL, a learned English antiquary, who was born in 1704. He was educated at Cambridge, and in 1763 obtained the prebendary of Brampton. His son, in writing his life, says that "His habits of life were such as became his station. In his clerical functions he was exemplarily correct, not entrusting his parochial duties at Whittington, (where he resided) to another (except to the neighbouring clergy, during his excursions into Kent, &c.), till the failure of his eyesight rendered it indispensably necessary; and even that did not happen till within a few years of his death. As a preacher, his discourses from the pulpit were of the didactic and exhortatory kind, appealing rather to the understanding than the passions of his auditory by expounding the Holy Scriptures in a plain, intelligible, and unaffected manner. He left in his closet considerably more than 230 sermons, composed by himself in his own handwriting, besides a few (not exceeding twenty-six), which he had transcribed in substance only from the printed works of eminent divines. Though Dr. Pegge's life was sedentary, from his turn to studious retirement, his love of antiquities, and of literary acquirements in general, yet these applications, which he pursued with great ardour and perseverance, did not injure his health. Vigour of mind, in proportion to his bodily strength, continued unimpaired through a very extended course of life, and nearly till he had reached *ultima linea rerum*, for he never had any chronic disease, but gradually and quietly sunk into the grave, under the weight of years, after a fortnight's illness, February 14, 1796." Dr. Pegge's son and grandson both exhibited considerable literary attainments.

PEIRCE, JAMES, a dissenting divine, who was born in London in 1673, and educated abroad. On his return he became minister of a congregation in

the metropolis, but subsequently removed to Exeter, where he remained till a schism arose in consequence of his refusal, in conjunction with his colleague Mr. Hallett, to profess their belief in the Trinity. This dispute ended in their ejection, and building a chapel for themselves. This involved them in a long controversy, but they zealously defended themselves. Mr. Peirce died in 1726. He published several works, the principal of which are his "Paraphrase on Some of the Epistles of St. Paul," and his "Vindiciæ Fratrem Dissidentium in Anglia."

PELOPIDAS, son of Hippocles, a Theban general, who was the friend and contemporary of Epaminondas, who lived till 364 B. C. To him belongs the honour of having freed his country from a tyrannical faction, and from the Lacedæmonian yoke. Having been banished from Thebes with several other patriots, he retired to Athens. Animated with an ardent love of liberty, he disguised himself and went to Thebes with a few conspirators, put to death the tyrants at a banquet where they were all assembled, and gave the signal for the expulsion of the Lacedæmonians, who had taken possession of the citadel in a time of peace. Pelopidas then served under Epaminondas with distinguished courage, and contributed much to the victory over the Lacedæmonians at Leuctra. He was afterwards commander-in-chief in three campaigns against Alexander, tyrant of Phœæ in Thessaly, who had once imprisoned him without any just cause; but, having pursued the prince too far, he was surrounded by the enemy, and fell.

PEMBERTON, HENRY, a learned English physician, who was born in 1694, and having received the rudiments of his education in England, was sent to Leyden to complete his studies. On his return he devoted nearly all his time to literature, his health being too delicate to enable him to follow his profession. After a long life devoted to the improvement of science, Dr. Pemberton died in 1771. Among his publications we may mention his "Lectures on Chemistry," his "View of Sir Isaac Newton's Philosophy," and his "Observations on Poetry."

PENN, SIR WILLIAM, an English admiral, who was born at Bristol in 1621, and educated for the maritime profession. He was employed in the war with the Dutch after the overthrow of the monarchical government in this country, and was also commander-in-chief under the duke of York in the signal victory over the Dutch in 1665, on which occasion he was knighted. On his return he was elected member of parliament for Weymouth; in 1660 commissioner of the admiralty and navy, governor of the fort and town of Kinsale, vice-admiral of Munster, and a member of that provincial council. He then quitted the naval profession, but continued his other employments till 1669, when he withdrew to Wanstead in Essex, and there died in 1670. Though he was thus engaged, both under the parliament and king, he took no part in the civil war, but adhered to the duties of his profession. Besides the reputation of being a great patriot, he acquired credit for having improved the naval service in several important departments. He was the author of several tracts on this subject, some of which are preserved in the British Museum. The monument erected to his memory by his wife in Radcliffe church, Bristol, contains a short account of his life.

PENN, WILLIAM, a celebrated philanthropist, who was the son of Sir William Penn, the English

admiral. He was born in London in 1644, and appears to have been seriously inclined from his youth, having imbibed religious impressions as early as his twelfth year, which were soon afterwards confirmed by the ministry of Thomas Loe, an eminent preacher among the religious body called quakers, then newly associated in religious fellowship. In his fifteenth year he was, notwithstanding, entered as a gentleman commoner of Christ Church, Oxford, where, meeting with other students who were devoutly inclined, they ventured to hold private meetings among themselves, in which they both preached and prayed. This gave great offence to the heads of the college, by whom they were at first only confined for nonconformity; but, persisting in their religious exercises, they were finally expelled the university. On his return home his father endeavoured in vain to direct his attention from his religious pursuits, as being likely to stand in the way of his promotion in the world; and, at length, finding him inflexible in what he now conceived to be his religious duty, beat him severely, and turned him out of doors. Relenting, however, at the intercession of his mother, and hoping to gain his point by other means, he sent his son to Paris, whence he returned so well skilled in the French language, and other polite accomplishments, that he was again joyfully received at home. After his return from France he was admitted a member of Lincoln's Inn, with the intention of studying the law, and continued there till his twenty-second year, when his father committed to him the management of a considerable estate in Ireland—a circumstance which was the origin of his becoming a quaker; for at Cork he met again with Thomas Loe, the person whose preaching had affected him so early in life. At a meeting in that city Loe began his discourse with these words: "There is a faith that overcomes the world, and there is a faith that is overcome by the world;" which so affected Penn, that from that time he constantly attended the meetings of the quakers. He was soon afterwards, with many others, taken at a meeting in Cork, and carried before the mayor, by whom they were committed to prison; but young Penn was soon released on application to the earl of Orrery, then lord president of Munster. His father being informed of his conduct recalled him home, and finding him unalterably determined to adhere by his own convictions of duty, in respect to plainness of speech and deportment, he would have compounded with him if he would only have consented to remain uncovered before the king, the duke (afterwards James II.), and himself. Being disappointed in this he a second time drove him from his home; yet, after a short time, being convinced of his integrity, he permitted him to return; and though he did not openly countenance him, he would use his interest to get him released when imprisoned for his attendance at religious meetings.

In the year 1668, in the twenty-fourth year of his age, Penn first appeared as a minister and an author; and it was on account of his second essay, entitled "The Sandy Foundation Shaken," that he was imprisoned in the Tower, where he remained seven months, during which time he wrote his most celebrated work, "No Cross no Crown," and finally obtained his release from confinement by an exculpatory vindication, under the title of "Innocency with her Open Face." In 1670 the meetings of dissenters were forbidden under severe penalties. The quakers,

however, believing it their religious duty, continued to meet as usual; and when forcibly kept out of their meeting-houses, they assembled as near to them as they could in the street. At one of these meetings William Penn preached to the people thus assembled for divine worship, for which he was committed to Newgate, and at the next session at the Old Bailey, was indicted for "being present at, and preaching to, an unlawful, seditious, and riotous assembly." He pleaded his own cause, though menaced by the recorder, and was finally acquitted by the jury; but he was, nevertheless, detained in Newgate, and the jury fined.

This trial is so singularly illustrative of the firmness of purpose, as well as the spirit of endurance, exhibited by this extraordinary man, that we cannot do better than take it from an historian of the period:—

Penn and his companion, agreeably to the custom of the friends, entered the court with their hats on; and one of the officers pulling them off, the lord mayor exclaimed, "Sirrah, who bid you put off their hats? Put on their hats again."

*Recorder to the Prisoners.*—Do you know where you are? Do you know it is the king's court?

*Penn.*—I know it to be a court, and I suppose it to be the king's court.

*Recorder.*—Do you not know that there is respect due to the court; and why do you not pull off your hats?

*Penn.*—Because I do not believe that to be any respect.

*Recorder.*—Well, the court sets forty marks a piece upon your heads, as a fine for your contempt of court.

*Penn.*—I desire it may be observed that we came into court with our hats off (that is taken off), and if they have been put on since, it was by order of the bench, and therefore not we but the bench should be fined. [After the witnesses for the prosecution had been examined and the prisoners were called upon for their defence, Penn demanded to know upon what law the indictment was grounded?]

*Recorder.*—Upon the common law.

*Penn.*—Where is that common law?

*Recorder.*—You must not think I am able to run up so many years and over so many adjudged cases, which we call common law, to answer your curiosity.

*Penn.*—This answer I am sure is very short of my question; for if it be common it should not be so hard to produce.

*Recorder.*—Sir, will you plead to your indictment? [Penn reiterated his demand to know on what law the indictment was founded.]

*Recorder.*—You are a saucy fellow; speak to the indictment.

After some further altercation—*Recorder.*—You are an impertinent fellow; will you teach the court what law is? It is *lex non scripta*, that which many have studied for thirty or forty years to know; and would you have me to tell you in a moment?

*Penn.*—Certainly; if the common law is so hard to be understood, it is far from being common; but if Lord Coke, in his Institutes, be any consideration, he tells us that common law is common right, and that common right is the greater charter of privileges. I design no affront to the court but to be heard in my just plea; and I must plainly tell you, that if you will deny me over of the law, which you say I have broken, you do at once deny me an acknowledged right; and evidence to the whole world your resolution to sacrifice the privileges of Englishmen to your sinister and arbitrary designs.

*Recorder.*—Take him away.

*Lord Mayor.*—Take him away; take him away; turn him into the bail-dock. [Penn was now dragged into the bail-dock. Mead being then called upon, a scene exactly similar to the preceding took place, and he also was thrust into the bail-dock. The recorder charged the jury to bring in a verdict of guilty.]

*Penn.*—(With a loud voice from the bail-dock). I appeal to the jury, who are my judges and this great assembly, whether the proceedings of the court are not most arbitrary and void of all law. I have not been heard; neither can you, the jury, legally depart the court before I have been fully heard.

*Recorder.*—Pull the fellow down, pull him down. [The jury were now desired to go up stairs, in order to agree upon a verdict, and the prisoners remained in the bail-dock. After an hour and a half's time eight came down agreed, but four remained above till sent for. The bench used many threats to the four that dissented; and the Recorder, addressing himself to one of them of the name of Bushel, said, "Sir, you are the cause of this disturbance, and manifestly show yourself an abettor of faction; I shall set a mark upon you, Sir."]

*Alderman Sir J. Robinson, Lieutenant of the Tower.*

—Mr. Bushel, I have known you near these fourteen years; you have thrust yourself upon this jury.

*Alderman Bloodworth.*—Mr. Bushel, we know what you are.

*Lord Mayor.*—Sirrah, you are an impudent fellow; I will put a mark upon you. [The jury being then sent back to consider their verdict, remained for some time; and on their return, the clerk having asked in the usual manner, "Is William Penn guilty of the matter wherein he stands indicted or not guilty?" The foreman replied "Guilty of speaking in Gracious (Grace church) street."]

*Court.*—Is that all?

*Foreman.*—That is all I have in commission.

*Recorder.*—You had as good say nothing. [The jury were ordered to go and consider their verdict once more. They declared that they had given in their verdict and could give no other. They withdrew, however, after demanding and obtaining pen,

ink and paper; and returning at the expiration of half an hour, the foreman addressed himself to the clerk of the peace, and presenting the following written decision, said, "Here is our verdict:—We, the jurors hereafter named, do find William Penn guilty of speaking or preaching to an assembly, met together in Gracious Street, on the 14th of August, 1670, and that William Mead is not guilty of the said indictment.

"Foreman, THOMAS VEER,

"EDWARD BUSHEL," &c.

*Recorder.*—Gentlemen, you shall not be dismissed until we have a verdict that the court will accept; and you shall be locked up without meat, drink, fire, or tobacco; you shall not think thus to abuse the court; we will have a verdict by the help of God, or you shall starve for it.

*Penn.*—My jury, who are my judges, ought not to be thus menaced; I do desire that justice may be done me, and that the arbitrary resolves of the bench may not be made the measure of my jury's verdict.

*Recorder.*—Stop that prating fellow.

*Penn.*—The agreement of twelve men is a verdict in law; and such an one being given by the jury, I require the clerk of the peace to record it, as he will answer at his peril. And if the jury brings in another verdict contradictory to this, I affirm they are perjured men in law. [Then looking towards them he emphatically added,] You are Englishmen, mind your privileges, give not away your right. [The court now swore several of its officers to keep the jury all night without meat, drink, fire, &c. and adjourned. Next morning, which happened to be Sunday, the jury were again brought up; and having persevered in their verdict much abuse was heaped upon them, particularly on the "factious fellow Bushel;" who observed that he had acted conscientiously. The expression called forth some very pleasant jeers from the court; who, being still determined not to yield the point, sent back the jury a third time. The jury were however inflexible: a third time they returned with the same verdict.]

The recorder, at this greatly incensed and perplexed, threatened Bushel with his vengeance. "While he had any thing to do with the city he would have an eye upon him." The lord mayor termed him a pitiful fellow," and added, "I will cut his nose for this."

*Penn.*—Intolerable, that my jury should be thus menaced.

*Lord Mayor.*—Stop his mouth, jailor; bring him fetters and stake him to the ground.

*Penn.*—Do your pleasure, I matter not your fetters. [The court determined to make one trial more of the firmness of the jury. The foreman remonstrated in vain, that any other verdict "would be a force upon them to save their lives," and the jury refused to go out of court until obliged by the sheriff. The court sat again next morning at seven o'clock; when the prisoners and the jury were brought up for the fourth time.]

*The Clerk.*—Is William Penn guilty or not guilty?

*Foreman.*—Not guilty.

*Clerk.*—Is William Mead guilty or not guilty?

*Foreman.*—Not guilty.

*Recorder.*—I am sorry, gentlemen, you have followed your own judgments and opinions rather than the good and wholesome advice that was given you. God keep my life out of your hands! but for this the court fines you forty marks a man, and commands

imprisonment till paid. [Both jury and prisoners were both forced into the bail-dock for non-payment of their fines, whence they were carried to Newgate. Mr. Bushel immediately sued out a writ of Habeas Corpus; and the cause having come to be heard at length before the twelve judges, they decided that the fining and imprisonment were contrary to the law. The jury were accordingly discharged; on which they respectively brought actions against the lord mayor, aldermen, and recorder, and obtained exemplary verdicts.]

Sir William died this year, fully reconciled to his son, to whom he left a large estate, taking leave of him in these memorable words:—"Son William, let nothing in this world tempt you to wrong your conscience. So will you keep peace at home, which will be a feast to you in a day of trouble." Shortly after this event, Penn travelled in the exercise of his ministry into Holland and Germany. In the year 1672 he married Gulielma Maria Springett, whose father, Sir William, was killed at the siege of Bamber, in the civil wars.

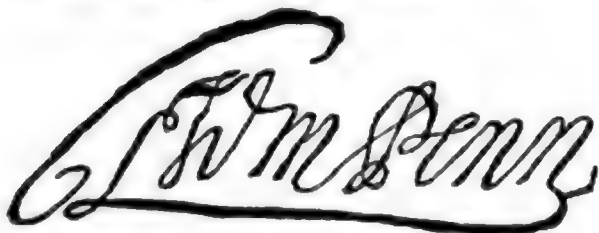

About this period we find Penn writing the following autograph letter to his friends in Ireland:—

"DEAR & OBLIDGEING FFR"

"Thy Afflicting, yet very kind letter, gave that blow to my Spirit, which for some time I have not been Able to Recover Myself, For I have Lost a great friend, and the Church a great Member, his parts tho' plain were Masculine and Strong, his Integrity Incorruptible, his friendship firm & his Zeal & Love for Truth always fresh and Tender, a good, plain, pious & useful Man. O! My Dr. friend, may I wish to find so Able & so Compassionate A friend In Eng: Ireland, or America. Without Offence? I have Lost too soon, and hope those my Sincere friends That Think with me so, Will please To still pity & help me, who have neither been bred nor us'd To help myself; but have my Dr. Brethren In some measure. This suddain great turn in my Affairs must hasten my Journey for Ireland, unless my Able Corke friends will please to make it useless & save me so severe a Journey as the present season if it continues will make Mine, & the more difficult for the weak Circumstances my poor Wife is under, tho' I bless God she rather increases her Strength, and almost Longs to see that too much Disposed as well as hard used Country. I desire thee to bestow on me a more ample Acct. of thy Brothers frame of spirit, and concerns., if thou pleasest, and what his Dr. & Sweet Wife purposes to do; also I beg of thee to lett the friends of Corke know, that the Money I drew is to pay the Interest of a mortgage 4 or 5 years old to my Son Aubrey, that if not pay'd, he may enter upon the Western Estate of above 400l. per an. which must not be; And this thy Brother knew as I writ to Tho. Wight when I drew the Bill of 1000l.: & indeed I had never drawn it, had not the Arrears (which thy Brother told me would Amount to 2000l., last November) been the Method proposed to me by him for the payment of it. But if the friends that advanced that thous<sup>d</sup>. pound will expect it out of present and growing Rents, I shall be postponed for my Bread, for I do assure thee I now borrow Money to be able to put it into my Children's mouths, & tho' I think to Write to friends of Corke on this subject, that they would now & then let me have fifty or an hundred pounds,

whilst they are a paying off for my subsistence (which I shall take for a great kindness) yet I intreat thee & my Dr. friends in & about Dublin to write to them, such as they know G. Rooke, T. Wilson &c. that they would please to Receive their Money with some tenderness to my Circumstances; if they fear a loss by my Death if I live not till they be pay'd, my Son Penn will secure them. And now give thy Dr. Sister Cuppege mine and my Wife's very Dr. Love for we are deeply concern'd in her affliction, and I fear least she looks upon me (by my concerns he so heartily espoused) as an Accessary to her unspeakable Loss, tho' I fear he made a little too much haste when he Returned, for he rode above 40 Miles a day & often Complain'd of his Loynes to my Man that waited on him to Chester, Dr. Amos let me hear from thee & that freely & largely and as soon as may be. So with Dr. Love to all Brethren & friends (& hoping thy Dr. Child is better) I close end.

Poor Edwd. Hustwell was } Thy affect. & faithful  
buried Last night. } friend,

In 1676 Penn became a manager of several proprietary concerns in New Jersey; and having divided that immense country into two separate portions, he drew up a constitution, and invited settlers. He returned to this country for a short time, and in 1679 he assisted Algernon Sidney in his contest for the borough of Guilford; and in 1680 he solicited Charles II. for a grant of certain lands in North America, by way of composition for the debt due by government to his father, who was then dead. In 1681 he became a proprietor of East New Jersey, afterwards named Pennsylvania, by the king; and commenced a settlement there. The plan of his new constitution had for its object "to support power in reverence with the people, and to secure the people from the abuse of power, that they may be free by their just obedience, and the magistrates honourable for their just administration; for liberty without obedience is confusion, and obedience without liberty is slavery."

In 1682 this good and intrepid adventurer visited Pennsylvania, and convoked the first assembly of that province. He then visited the interior of the country, had frequent interviews with the Indians, indemnified them for their lands, founded the city of Philadelphia, and beheld the woods every where levelled and the country fast peopling with inhabitants. At the end of two years he revisited England, where, on account of his favour with James II., he was considered as a "papist and Jesuit." He now interceded with that monarch in behalf of John Locke; and entered into an interesting correspondence with Tillotson. Such now was his influence that he had a great share in obtaining the "Toleration Act."

On the revolution some fears were entertained for Mr. Penn, on account of his personal attachment to the abdicated monarch, and shortly after this epoch he was very unjustly deprived of his government by King William, but afterwards restored in 1699; on which he undertook a second voyage to America.

He now opened the way for the abolition of negro slavery, and rectified the various disorders that had crept into the government during his absence. In 1701 he returned to his native country, and after encountering a variety of hardships and difficulties, during which he was obliged to mortgage his province for a small sum, he died at Rushcomb, on the 30th of July, 1718.

The accompanying sketch of the tree beneath which this truly philanthropic lawgiver made his final treaty of amity with the Indians of his province, forms the best monument to his memory.

We are told by his biographer "that he was tall in stature, and of an athletic make. He delighted, when young, in manly sports. In maturer years he was inclined to corpulency, but using a great deal of exercise he was very active with it. Silvanus Bevan, a chemist of eminence in London, who, when young, had known him well, took great pains to form a bust of him some time after his decease, in which he was assisted by others familiarly acquainted with him, and having made three copies of it, he sent one of them to Philadelphia.

"William Penn was very neat, though plain in his dress. He walked generally with a cane. He was very neat also in his person, and had a great aversion to the use of tobacco. William Penn is said to have possessed fine talents, and Sir John Rhodes says, that he was qualified for a high station in life by very bright and excellent parts, and these cultivated and improved by the advantage of a very liberal education, and also polished by travelling abroad, and by conversation with some of the greatest men the age produced. He was indefatigable as a minister of the gospel, and used, while preaching, language the most simple and easy to be understood; and he had a happy way of explaining himself by images the most familiar. He was of such humility that he used generally to sit at the lowest end of the space allotted to ministers, always taking care to place above himself poor ministers, and those who appeared to him to be peculiarly gifted."

William Penn was the author of several works, many of which relate to his own sect. Among them we may mention, in addition to those already enumerated, his "Brief Account of the Rise and Progress of the Quakers," and "Primitive Christianity Revived in the Faith and Practice of the People called Quakers."

PENNANT, THOMAS, a learned English antiquary and naturalist, who was born at Downing, in Flintshire, in 1726. He was educated at Oriel college, Oxford, which, however, he left without taking

his degree. His first production was an account of an earthquake which was felt at Downing in 1750. It appeared in the "Philosophical Transactions," and the following year he was chosen a member of the royal society of Upsal. In 1761 he began his "British Zoology." Edwards, the celebrated ornithologist, conceived at first a little jealousy on this attempt, but it very soon subsided and they became very good friends. He devoted the profits of the "British Zoology" to the Welsh charity school in Gray's Inn Lane, London, and supported the greater part of the expense; but he lost considerably by it, and the school did not gain so much as it might if the work had been printed in a quarto instead of a large folio size. In 1765 he made a short tour to the continent, where he enjoyed the company of the celebrated Buffon, who publicly acknowledged his favourable sentiments of Mr. Pennant's studies in the fifteenth volume of his "Natural History." At Ferney he visited Voltaire, who happened to be in good humour, and was very entertaining; but, "in his attempt to speak English, satisfied the visitors that he was perfect master of the oaths and curses which disgrace our language."

During this tour Mr. Pennant met with Dr. Pallas, and this meeting gave rise to his "Synopsis of Quadrupeds," and the second edition under the name of "The History of Quadrupeds." Mr. Pennant had proposed this plan to Pallas, but owing to the latter being promoted at the court of Petersburg, it ultimately devolved on himself. In 1767, after his return, he was elected a fellow of the royal society. In 1768 his "British Zoology" was published in two volumes, octavo. In 1769 he added a third volume, in octavo, on the reptiles and fishes of Great Britain. In the fifty-eighth volume of the "Philosophical Transactions," was published his account of a new species of Pinguin, brought by Captain Macbride, from the Falkland Islands. In the same year, in conjunction with Sir Joseph Banks, and a gentleman

named Loten, who had been a governor in one of the Dutch islands in the Indian Ocean, he published twelve plates of "Indian Zoology," but that work was afterwards discontinued. "In the spring of 1769, I had," says he, "the hardiness to venture on a journey to the remotest part of North Britain, a country almost as little known to its southern brethren as Kamtschatka. I brought home a favourable account of the land. Whether it will thank me or no I cannot say, but from the report I have made, and showing that it might be visited with safety, it has ever since been *inondée* with southern visitants." In 1770 he published more than a hundred additional plates to the "British Zoology," with descriptive additions; and in 1771 he printed at Chester his "Synopsis of Quadrupeds," octavo. In the same year he was honoured by the university of Oxford with the degree of doctor of laws, conferred in full convocation. About the close of the year he gave the public his "Tour in Scotland." A candid account of that country was such a novelty that the impression was instantly bought up, and in the following year another was printed, and as soon sold. In May 1772 he made his "Second Tour in Scotland, and Voyage to the Hebrides." "My success," he observes on this occasion, "was equal to my hopes; I pointed out every thing I thought would be of service to the country; it was roused to look into its advantages; societies have been formed for the improvements of the fisheries and for founding of towns in proper places; to all which I sincerely wish the most happy event; vast sums will be flung away; but incidentally numbers will be benefited, and the passions of patriots tickled. I confess that my own vanity was greatly gratified by the compliments paid to me in every corporated town. Edinburgh itself presented me with its freedom, and I returned rich in civil honours."

In 1773 he published the octavo edition of "Genera of Birds," and performed a tour through the north of England, where his companion Mr. Griffith made a number of drawings of antiquities, &c., several of which were afterwards used by Mr. Grose, in his "Antiquities of England." In this tour he became acquainted with Mr. Hutchinson, the historian of Durham; the account of his interview with that gentleman he describes in the following words:—"I was mounted on the famous stones in the churchyard of Penrith, to take a nearer view of them, and see whether the drawing I had procured, done by the Rev. Dr. Tod, had the least foundation in truth. Thus engaged, a person of good appearance, looking up at me, observed what fine work Mr. Pennant had made with those stones. I saw he had got into a horrible scrape; so, unwilling to make bad worse, I descended, laid hold of his button, and told him, 'I am the man!' After his confusion was over I made a short defence, shook him by the hand, and we became from that moment fast friends."

*Tho Pennant.*

In 1774 he published a third edition, with additional plates, of his "Tour in Scotland" and his "Voyage to the Hebrides," and in 1775 appeared his third and last volume of the "Tour in Scotland." These were followed two years after by a fourth volume of the "British Zoology," containing the *vermes*,

the crustaceous and testaceous animals of our country. After several journeys over the six counties of North Wales, in which he collected ample materials for their history, he published the account of them under the title of "A Journey to Snowdon." In the same year a new edition appeared of his "Synopsis of Quadrupeds," with considerable improvements. In 1781 he was elected an honorary member of the society of antiquaries at Edinburgh; and in the following year he published his "Journey from Chester to London." In 1784 appeared his "Letter from a Welch Freeholder to his Representative." The same year he published his "Arctic Zoology," in two volumes quarto. This work was the origin of his being elected member of the American philosophical society at Philadelphia.

In 1787 he published "A Supplement to the Arctic Zoology." In 1790 appeared his "Account of London," the antiquities of which he had studied with great attention. Of this work he says, "I had so often walked about the several parts of London with my note-book in my hand, that I could not help forming considerable collections of materials. This work went through three large impressions in about two years and a half." In 1793 he published his life, under the whimsical title of "The Literary Life of the late Thomas Pennant, Esq., by Himself." In the advertisement he states that the termination of his authorial existence took place on the 1st of March, 1791. He came to life again, however, in 1797, and published "The History of the Parishes of Whiteford and Holywell;" and in the last year of his life he gave the public his "View of Hindostan," for which he thus accounts: "A few years ago I grew fond of imaginary tours, and determined on one to climes more suited to my years, more genial than that to the frozen north. I still found, or fancied that I found, abilities to direct my pen. I determined on a voyage to India, formed exactly on the plan of the introduction to the "Arctic Zoology," which commences at such parts of the north as are accessible to mortals. From London I follow the coasts southern to part of our island, and from Calais along the oceanic shores of Europe, Africa, and Asia, till I have attained those of New Guinea. Respecting these I have collected every information possible from books, ancient and modern; from the most authentic, and from living travellers of the most respectable characters of my time. I mingle natural history, accounts of the coasts, climates, and every thing which I thought could instruct or amuse; they are written on imperial quarto, and, when bound, make a folio of no inconsiderable size; and are illustrated at a vast expense by prints taken from books, or by charts and maps, and by drawings by the skilful hand of Moses Griffith, and by presents from friends. With the bare possibility of the volume relative to India, none of these books are to be printed in my lifetime; but to rest on my shelves, the amusement of my advancing age." Of these manuscripts there were in all twenty-two volumes originally; but Mr. Pennant, as we have mentioned, printed in his lifetime that which relates to India. We may add in his own words, "Happy is the age that could thus beguile its fleeting hours, without injury to any one; and, with the addition of years, continue to rise in its pursuits." Mr. Pennant closed his useful and protracted life on the 16th of December, 1798.

PENNINGTON, ISAAC, a writer of considerable BIOGRAPHY.—VOL. II.

talent, who belonged to the society of Friends. He received a learned education, and, being anxious to acquire a vital and spiritual religion, directed his attention to various sects. Thus disposed, he attended the preaching of Charles Fox, and shortly after joined the Quakers. He experienced a very harsh treatment in consequence, and although he resided on his own estate in great retirement, yet he was several times sent to prison by the government; but he bore all with great meekness, and died in 1679. He was the author of several controversial tracts, which were very popular among his own sect.

PEPPERELL, SIR WILLIAM, a lieutenant-general in the service of the British before the American revolution. He was born in the district of Maine, and about the year 1727 was chosen one of his majesty's council, to which he was annually re-elected until his death—a period of thirty-two years. He possessed a vigorous frame and much energy and firmness of character, which rendered him of great utility to a country exposed to a ferocious enemy. He was bred a merchant, but the principal portion of his time was spent in the discharge of the duties of a soldier, and he rose to the highest military honours. When the expedition against Louisburg was contemplated, he was commissioned by the governors of New England to command the troops, and, investigating the city in the beginning of May 1745, soon forced it to capitulate. To reward his services, the king created him a baronet. He died at his seat in Kittery, Maine, on the 6th of July, 1759.

PEPUSCH, JOHN CHRISTOPHER, a musical composer, who was born at Berlin in 1667. His father, a minister of a protestant congregation in that city, discovering in his son an early propensity to music, employed at the same time two different masters to instruct him,—the one in the theory, and the other in the practice of his art. At the age of fourteen he was sent to court, and accompanied one of the ladies who sang before the queen, who was so much pleased with him that he was immediately appointed to teach the prince the harpsichord. Pepusch quitted Berlin, and arriving in England about the year 1700, was retained as a performer at Drury Lane. It is probable that he assisted in adapting the operas for the stage that were performed there. The abilities of Pepusch as a practical composer were not likely to become a source of wealth to him; his music was correct, but it wanted variety of modulation; besides which, Handel had got possession of the public ear, and the whole kingdom were forming their taste of harmony and melody by the standard of his compositions. Pepusch, who soon became sensible of this, wisely directed his talents into another course, and became a teacher of music.

In the year 1713, at the same time with Croft, Pepusch was admitted to the degree of doctor in music in the university of Oxford, and continued to prosecute his studies with great assiduity. About the year 1722 Dr. Pepusch was married to Miss l'Epine. The fortune which she had acquired was estimated at 10,000*l.*, and the possession of that sum enabled him to live in a style of elegance, which, till his marriage, he had been a stranger to. This change in his circumstances was no interruption to his studies; he loved music, and he pursued the knowledge of it with ardour. He, at the instance of Gay and Rich, undertook to compose, or rather to correct the music

to "The Beggar's Opera." Every one is aware that the music to this drama consists solely of ballad tunes and country dances; it was nevertheless necessary to settle the airs for performance, and also to compose basses to such as needed them. This Pepusch did, prefixing to the opera an overture.

About the year 1740 Pepusch's wife died, and he, having before lost his son, an only child, had scarcely any sources of delight left other than the prosecution of his studies and teaching a few favourite pupils, who attended him at his apartments. Here he drew up a learned treatise which was read before the royal society, and is published in "The Philosophical Transactions" for the months of October, November, and December, in the year 1746; and soon after the publication he was elected a fellow of the royal society. He died in the year 1752.

**PEPYS, SAMUEL**, a celebrated secretary to the admiralty in the reigns of Charles II. and James II., who was born at Brampton in Huntingdonshire, and educated at Cambridge. He early acquired the patronage of Montague, afterwards earl of Sandwich, who employed him as secretary in the expedition for bringing Charles II. from Holland. On his return he was appointed one of the principal officers of the navy. In 1673, when the king took the admiralty into his own hands, he appointed Mr. Pepys secretary to that office. He was employed under Lord Dartmouth in the expedition against Tangier, and often accompanied the duke of York in his naval visits to Scotland and coasting cruises. On the accession of William and Mary he published his "Memoirs" relating to the navy for ten years preceding, and led a retired life from this time till his death in 1703. He was president of the royal society for ten years. He left a large collection of manuscripts to Magdalen college, Oxford, consisting of naval memoirs, prints, and five large folio volumes of ancient English poetry, begun by Selden, and carried down to 1700, from which "The Reliques of Ancient English Poetry," by Dr. Percy, are principally selected. His "Diary" affords a curious picture of the dissolute court of Charles II.

**PERCEVAL, SPENCER**.—This celebrated statesman was the second son of John Perceval, earl of Egmont. He was born in 1762, and received his education at Harrow and Trinity college, Cambridge, of which he became a member about the year 1775. On quitting the university he studied law, and soon distinguished himself as a sound constitutional lawyer, and obtained a silk gown. In 1801 he became solicitor-general, and in 1802 attorney-general. On the formation of the new ministry in 1807, after the death of Mr. Fox, he was appointed chancellor of the exchequer. In this post he continued till the 11th of May, 1812, when, while in the act of approaching the door of the house of commons, a person named Bellingham, who had for some time previously presented a variety of memorials respecting some alleged ill treatment received in Russia, shot him dead with a pistol in the lobby. The assassin, who avowed that he had been waiting with the view of destroying Lord Leveson Gower, the ambassador to the court of St. Petersburg, made no attempt to escape, and was instantly arrested. Although a plea of insanity was set up by his counsel, he was found guilty, and executed on the 18th of the same month. Mr. Perceval was buried in Westminster Abbey, and the monu-

ment erected to his memory is delineated below. It is sculptured by Westmacott.

As a public speaker, Mr. Perceval obtained considerable eminence in the house of commons, where he explained and defended his public measures with great eloquence; and had his life been spared, it is probable that he would have attained great eminence as a statesman.

**PERCIVAL, THOMAS**, an English physician, who was born at Warrington in Lancashire in 1740. Having received a good education, he commenced business at Manchester, where he rose to eminence in his profession, but was not successful in his attempt to establish public lectures in the town on the fine arts, mathematics, &c. He was equally unsuccessful in his plan of establishing dissenting academies at Warrington and Manchester.

The leisure which Dr. Percival enjoyed gave him the opportunity of engaging in various philosophical and experimental inquiries. The essays which he composed as the result of his investigations, were sometimes presented to the royal society, and were afterwards inserted in the volumes of its Transactions; at other times they were communicated to the public through the medium of the most current periodical journals. These were afterwards collected and published in one volume under the title of "Essays, Medical and Experimental." A second volume appeared in 1773, and a third in 1776, and were received by the learned world as the productions of a man of profound knowledge and sound judgment. Extensive as Dr. Percival's practice was, he found leisure to continue those publications on which his fame is founded. Among these we may mention "Observations and Experiments on the Poison of Lead," "A Father's Instructions, consisting of tales, fables, and reflections, designed to promote the love of virtue, a taste for knowledge, and an early acquaintance with the works of nature," 1775. Two years after he added another volume completing the work, which is executed in a manner excellently adapted to its object, "On the Use of Flour of Zinc in Epileptic Cases," "Miscellaneous Practical Observations," "Account of the Earthquake at Manchester," "The Disadvantages of Early Inoculation," "Experiments and Observations on Water," "Moral and Literary Dissertations," "Experiments and Observations on the Waters of Buxton and Manchester," &c. Dr. Percival died in August 1804, and his works were afterwards collected and published by his son. Dr. Magee gives the following character of Mr. Percival. He says, "The character of this

gentleman was in every way calculated to secure for him that eminence in his profession, and that general respect, esteem, and attachment, which he every where obtained. A quick penetration, a discriminating judgment, a patient attention, a comprehensive knowledge, and, above all, a solemn sense of responsibility, were the endowments which so conspicuously fitted him at once to discharge the duties and to extend the boundaries of the healing art; and his external accomplishments and manners were alike happily adapted to the offices of his profession. In social discussion he possessed powers of a very uncommon stamp, combining the accuracy of science, and the strictest precision of method, with the graces of a copious and unstudied elocution; and to these was superadded the polish of a refined urbanity, the joint result of innate benevolence, and of early and habitual intercourse with the most improved classes of society. In few words, he was an author without vanity, a philosopher without pride, a scholar without pedantry, and a Christian without guile. Affable in his manners, courteous in his conversation, dignified in his deportment, cheerful in his temper, warm in his affections, steady in his friendships, mild in his resentments, and unshaken in his principles; the grand object of his life was usefulness, and the grand spring of all his actions was religion. As a literary character Dr. Percival held a distinguished rank. His earlier publications were devoted to medical, chemical, and philosophical inquiries, which he pursued extensively, combining the cautious but assiduous employment of experiment with scientific observation and much literary research. His 'Essays, Medical and Experimental' obtained for the author a considerable reputation in the philosophical world, and have gone through many editions. The subjects which occupied his pen in later years were of a nature most congenial to his feelings; and in the several volumes of 'A Father's Instructions to his Children,' and of 'Moral Dissertations,' which appeared at different periods, through a space of twenty-five years, and which were originally conceived with the design of exciting in the hearts of his children a desire of knowledge and a love of virtue, there is to be found as much of pure style, genuine feeling, refined taste, apt illustration, and pious reflection, as can easily be discovered in the same compass in any didactic composition. His last work, which he expressly dedicated as a 'parental legacy' to a much-loved son, under the title of 'Medical Ethics, or a Code of Institutes and Precepts, adapted to the professional conduct of physicians and surgeons,' published in 1803, is a monument of his professional integrity, in which, while he depicted those excellencies of the medical character which he approved in theory, he unconsciously drew the portrait of himself, and described those which he every day exemplified in practice."

PERCY, THOMAS, bishop of Dromore, in Ireland, a descendant of the family of Northumberland, who was born in Bridgenorth in 1728, and graduated at Christ Church, Oxford, in 1753. In 1769 he was appointed chaplain to the king, and in 1778 raised to the deanery of Carlisle, which he resigned four years after for the Irish bishopric of Dromore. The most popular of his works are his "Reliques of Ancient English Poetry," and a poem, "The Hermit of Warkworth." He was well skilled in the Icelandic and several of the oriental languages, especially the

Chinese, from which he made some translations. His other writings are, "A Key to the New Testament," a new version of "Solomon's Song," with translations of Mallet's "Northern Antiquities," and some pieces of Icelandic poetry. He also published a curious domestic record, long extant in the Percy family, and known as "The Northumberland Household Book," a document valuable for the light it throws on manners. His death took place at Dromore in 1811.

PERDICCAS, the name of several kings of Macedonia, and, at a later period, of the most distinguished general of Alexander, a noble Macedonian, who attended him on his campaign to Asia, and enjoyed his confidence above all others. Alexander, just before his death, gave him his signet-ring, the emblem of regal power, and, by this action, seemed to fix upon him as his successor to the throne. Perdicas was ambitious enough to desire this elevation; but the influence of his enemies and rivals prevented him from receiving a higher rank than that of guardian of the heir to the throne. He succeeded, however, in making himself second only to the king; but he aspired still higher, and was engaged in a war with his rival Ptolemy, when his soldiers mutinied, partly owing to his own arrogance. He was assassinated by his soldiers in Egypt B. C. 321, three years after he had been appointed guardian to the successor of Alexander.

PEREGRINUS, PROTEUS, a notorious character, who flourished in the first half of the second century. He was born at Parium, in Mysia. After many excesses, he was charged with parricide, and was obliged to flee. He went to Palestine, became a Christian, and, by his zeal, which brought him to a dungeon, gained the name of a martyr. He received support and sympathy from every quarter, till the prefect of Syria set him at liberty. He now recommenced his wanderings, was excluded from the church for his vices, and then gave himself up to the most disgraceful excesses. An object of universal abhorrence, he desired at least to finish his career in an extraordinary manner. He accordingly gave out that he should burn himself alive at the Olympic games. This he did, in the presence of an immense multitude, A. D. 168. Much interest has been given to the history of this singular character by the romance of Wieland.

PEREZ, DAVID, a musical composer, who was born at Naples in 1711. He owed his musical education to Antonio Gallo and Francesco Mancini. On leaving the conservatory he did not observe the usual custom of travelling throughout Italy, but repaired to Sicily, where he filled the functions of chapel-master in the cathedral of Palermo. The Sicilians are not less sensible to melody than the Italians; perhaps they are more so. It is certain that their ear, their tact, and their musical taste, are as much practised as those of the Neapolitans; for all the operas composed at Naples are performed in their theatres. Perez composed his first operas for the theatre at Palermo from 1741 to 1748. While in Sicily this composer obtained great reputation. He returned to Naples, and soon after his arrival gave his opera of "La Clemenza di Tito" at the theatre of San Carlos. This work had as much success at Naples as his preceding compositions experienced in Sicily. The fellow-citizens of Perez acknowledged in his style that of the great masters of their school. His reputation increased, and he was

invited to Rome by the manager of the great theatre, where he immediately became celebrated. His first work was the opera of "Semiramide;" that of "Farnese" soon followed. From Rome he proceeded to the other Italian cities, and successively composed "Didone Abbandonata," "Zenobi," and "Alessandro nell'Indie," which sustained a comparison with the operas of the best masters of the most celebrated schools of Italy. Whilst most of the Italian cities disputed the possession of Perez, Joseph, king of Portugal, invited him, in 1752, to Lisbon, as his chapel-master; and the suffrages of the Portuguese were added to those of the Italians when they heard "Demofonte," the opera in which the author first discovered to them his talent and his style. The compositions of Perez bear the stamp of genius, strength, and science; but perhaps they were deficient in grace. Dr. Burney, however, in speaking of him, says, "It appears, on examining his scores, that this master had not, like Jomelli, much exercised his pen in the composition of fugues or learned counterpoint for the church. There is, however, an original grace and elegance in all his productions." Perez died in the service of King Joseph, aged sixty-seven, after living twenty-seven years in Portugal, much admired, beloved, and respected. A dirge of his own composition was performed by the best musicians in Lisbon. Like Handel, he was blind during the latter years of his life; and when labouring under this calamity, and confined to his bed, frequently dictated, without an instrument, compositions in parts. He left much church music of almost unrivalled beauty.

PERGOLESI, GIOVANNI BATTISTA, was born at Casoria, about ten miles from Naples, in 1704. His friends, discovering very early that he had a talent for music, placed him in the conservatorio at Naples, called Dei Poveri in Giesou Cristo, which has been since suppressed. Gaetano Greco then presided over that celebrated school. This judicious master, soon perceiving traits of unusual genius in his young pupil, took particular pleasure in facilitating his studies, and in communicating to him all the mysteries of his art.

The progress of the young musician was proportioned to the uncommon advantages of nature and art with which he was favoured; and at a time when others had scarcely learned the gamut, he produced specimens of ability which would have done honour to the first masters of Naples. At the age of fourteen he began to perceive that taste and melody were sacrificed to the pedantry of learned counterpoint; and after vanquishing the necessary difficulty in the study of harmony and scientific texture of the parts, he entreated his friends to take him home, that he might indulge his own fancies and write some music that was more agreeable to his natural perceptions and feelings. The instant he quitted the conservatorio he totally changed his style and adopted that of Vinci; from whom he received lessons in vocal composition, and also from Hasse, who was then in high favour. With equal simplicity and clearness he surpassed them both in graceful and interesting melody. His countrymen, however, were the last to discover his superiority; and his first opera, performed at the second theatre in Naples, called "Dei Fiorentini," met with but little success. The prince of Stegliono, however, first equerry to the king of Naples, discovering great abilities in young

Pergolesi, took him under his protection; and from the year 1730 to 1734, by his influence, procured employment for him at the Teatro Nuovo. During this period his productions were chiefly of the comic kind, with the exception of the "Serva Padrona," in the Neapolitan dialect, which is unintelligible to the rest of Italy. He, however, subsequently obtained an engagement at the principal theatre at Rome, but even then his compositions were received with coldness, and he finally returned to Naples. Soon after the duke of Matelon, a Neapolitan nobleman, engaged him to compose a mass and vespers for the festival of a saint, which was about to be celebrated at Rome with the greatest magnificence. It was on this occasion that he composed the mass, "Dixit," and "Laudate." They were heard for the first time in the church of San Lorenzo, with general applause.

His health, however, daily and visibly declined. His first patron, the prince of Stegliono, who had never withdrawn his protection, advised him to take a house at Torre del Greco, near Naples, by the seaside, almost at the foot of Mount Vesuvius; and during his last sickness Pergolesi composed his celebrated cantata of "Orpheus and Euridice," retaining his faculties in full vigour to the last moment of his existence. At Torre del Greco he also composed his "Stabat Mater." The "Salvi Regina" was the last of his productions, and he died very soon after it was finished, in 1737, at the age of thirty-three. The instant his death was known all Italy manifested an eager desire to hear and possess his productions, not excepting his first and most trivial farces and intermezzi; the Neapolitans themselves, who had heard them with indifference during his life, were now solicitous to do justice to their deceased countryman. Rome, now sensible of her former injustice, as an *amende honorable*, revived his opera of "Olimpiade." It was now brought out with great magnificence, and that indifference with which it had been heard but two years before, was now converted into rapture.

PERICLES, one of the most celebrated statesmen of Greece, whose age may be considered as the most flourishing period of Grecian art and science, was born at Athens. His father was Xantippus, a general celebrated for his victory over the Persians at Mycale. Damon, Anaxagoras, and Zeno of Elea, were his instructors. Connected by family relations with the aristocracy, he at first avoided taking part in the concerns of state, both on account of the jealousy with which the multitude viewed this party, and because Cimon was already at its head. He therefore aimed, at first, only to gain the favour of the popular party. Cimon was munificent and affable; Pericles, on the contrary, shunned festivals and all public amusements. He was never seen abroad, but in the Prytaneum and the popular assembly, and his manners were characterized by gravity and dignity. As he was not a member of the Areopagus, he used all his influence to diminish the consideration of that body, and instigated his friend Ephialtes to make that tribunal an object of jealousy in the eyes of the people, and to procure the passing of a decree transferring the investigation and decision of most cases to other courts. His eloquence was so elevated and powerful that it was said of him that he thundered and lightened in his speeches, and his countrymen called him the Olympian. He carefully avoided all

that could displease the people, and even submitted to indignities with the greatest patience. It is said that a common citizen followed him to his house one evening from a popular assembly, reviling him at every step. He ordered a servant to light the man home with a torch.

When the popular party procured the accusation of Cimon, Pericles was one of the judges. He conducted the trial, however, with great moderation, and spoke of his distinguished fellow-citizen with due respect. The banishment of his rival removed all obstructions to the execution of his ambitious designs. As Cimon had fed and clothed the people, Pericles also provided for the wants of the needy from the public treasury. In the war which broke out between the Athenians and Lacedæmonians B. C. 458, Pericles exposed himself to the greatest dangers in the unsuccessful engagement at Tanagra, and soon after invaded the Peloponnesus with a fleet and a small army. To please the people, who desired the return of Cimon, he caused a decree to be passed for his recall. By means of his sister, however, Pericles had made a private agreement with Cimon, by which the command of the army was left to the latter, and the government of the state was to be in the hands of Pericles. On the death of Cimon he became, as it were, prince of Athens; for, although the aristocracy set up against him Thucydides, the son of Melesias, a relation of Cimon, he was too unequal to maintain the opposition. "If I should throw him to the ground," said he once of Pericles, "he would say that he had never been prostrated, and would persuade the spectators to believe him." From this time Pericles ruled the state, but without assuming the title of prince, and endeavoured to occupy the people with the establishment of new colonies or warlike enterprises. By his great public works he flattered the vanity of the Athenians, while he beautified the city and employed many labourers and artists. To pay the expenses of these undertakings he caused the public treasury of Greece to be transported from Delos to Athens, and justified this act of perfidy by saying that the money had been raised to defend the nation from the invasion of barbarians; and, as this end had been attained by the exertions of the Athenians, the allies had no further right to inquire into the expenditure of the funds.

His personal integrity in pecuniary matters was above suspicion. Of this we have a remarkable example:—During an expedition against Eubœa, the Lacedæmonians invaded Attica as the allies of the Megarians. Pericles averted an attack by bribing the tutor of the Spartan king. When he submitted his accounts for examination, ten talents were charged for secret services, and the Athenians were satisfied without any further account. Pericles finally made himself master of the important island of Eubœa, B. C. 447, and soon after concluded a truce of thirty years with the Spartans. To set bounds to the popular power, which he had hitherto laboured to increase, he now procured the revival of an old law, declaring no person a citizen of Athens whose father and mother were not both Athenian citizens, and caused 5000 individuals, who had before been free, to be sold as slaves. This act is a proof of the great influence of Pericles, and, doubtless, obtained the approbation of a majority of the citizens, whose importance was increased by a diminution of their numbers. Pericles took advantage of the armis-

tice with Sparta to make war upon the Samians, B. C. 440, who opposed the pretensions of Athens. He was partly persuaded to undertake this war by Aspasia. The expedition, in which she attended Pericles, ended in the subjugation of the island and the restoration of the democratic government. The Samians soon rose and expelled the Athenian garrison, but Pericles again reduced them to submission. On his return to Athens he delivered the celebrated funeral oration in memory of those who had perished in the expedition, which had such an effect upon his audience that the women crowded about him and wreathed his temples with flowers. Thucydides was banished in the struggle of parties, and the importance of Pericles was greatly increased, till the jealousy of the Athenians awoke, when they found those hopes abortive which had been excited by the events that preceded the Peloponnesian war. Some of the friends of Pericles became the objects of public prosecution—Anaxagoras, his venerable instructor, on a charge of irreligion; Aspasia on account of her connexion with Pericles. He undertook to plead her cause himself, and was so affected that he forgot his dignity and burst into tears. He procured her acquittal; but he withdrew Anaxagoras from the attacks of his enemies by conducting him from Attica under his own protection.

When the Spartans, who had assumed the protection of the smaller states of Greece, sent to Athens, demanding a compensation for the injuries which had been done to these states, and threatening war in case of refusal, Pericles persuaded the Athenians to reject the proposal, and thus became the author of the fatal Peloponnesian war. Some maintain that his object was to keep his countrymen employed abroad, in order to avert their attention from his government, particularly as his enemies were daily increasing, and that Aspasia entertained a violent hatred against Sparta. The probability is, that Pericles, misled by his views of the dignity and importance of the Athenian republic, would consent to no concessions, particularly as such a measure would be fatal to his own greatness. At the commencement of the war Pericles recommended to the Athenians to turn all their attention to the defence of the city and to naval armaments rather than to the protection of their territories. Accordingly, as he was made commander-in-chief, notwithstanding the murmurs of the Athenians, he allowed the superior forces of the Spartans and their allies to advance to Acharnæ, in Attica, without resistance, and at the same time sent a fleet to the shores of Peloponnesus, to Locris and Ægina, which took twofold vengeance for the ravages in Attica. After the Peloponnesians had retired he invaded the territory of Megaris, which had been the cause of the war. At the end of this campaign he delivered an eulogy over those who had fallen in their country's service. The next year a plague broke out at Athens, which made such dreadful havoc that Pericles was obliged to summon all his fortitude to sustain his countrymen and himself. To occupy their attention he fitted out a large fleet and sailed to Epidaurus; but the mortality among his troops prevented him from effecting any thing important. He returned with a small force but the Athenians no longer put confidence in him. He was deprived of the command, and obliged to pay a heavy fine, though no particular crime was charged against him.

The fickle people, however, soon recalled him to the head of the state, and gave him more power than he had before enjoyed. But, amid his numerous civil cares, he was afflicted by domestic calamities. His eldest son, Xantippus, who had lived at variance with him, died of the plague. The same disease carried off his sister and many of his nearest relatives and friends, and, among the rest, Paralus, his only remaining son by his first marriage. This affliction moved him to tears. To console him for this loss the Athenians repealed the law which he had himself previously introduced in regard to children whose parents were not both citizens, and thus placed his son by Aspasia among the citizens. But his strength was gone: he sunk into a lingering sickness, and died B. C. 429, in the third year of the Peloponnesian war. When he lay upon his death-bed, his friends, in their lamentations, spoke of his great achievements; but he suddenly started up and exclaimed "In these things I have many equals; but this is my glory, that I have never caused an Athenian to wear mourning." By the death of Pericles, Athens lost her most distinguished citizen, to whom, although deficient in severe virtue, is not to be denied greatness of soul. His education enlightened his mind and raised him above the prejudices of his age. His ambition was to give his country supremacy over all the states of Greece, and, while he ruled it, Athens maintained this rank, both in an intellectual and political view. To Pericles the city was indebted for its finest ornaments—the parthenon, the odeon, the propylæum, the long walls, numerous statues, and other works of art. The golden age of Grecian art, the age of Phidias, ceased with Pericles. His name is therefore connected with the highest glory of art, science, and power in Athens; and if he is accused of having conducted the city to the edge of that precipice from which she could not escape, yet he must receive the praise of having contributed greatly to make her the intellectual queen of all the states of antiquity.

PERIER, CASIMER, an eminent banker, and member of the French chamber of deputies, in which he was one of the most distinguished liberal orators. He was born at Grenoble in 1777, and after finishing his education at the college of the oratory in Lyons, entered the military service at an early age. He served with honour in the campaigns of Italy, but on the death of his father, a respectable merchant, he abandoned the profession of arms for mercantile business. In 1802 he established a banking house in company with his brother, in the management of which he acquired an intimate acquaintance with the most difficult and important questions of public credit and finance. Cotton manufactories, machine manufactories, and several other manufacturing establishments were carried on by the brothers, and Casimir introduced improvements into the processes. In 1815 Casimir Périer published a pamphlet against the system of foreign loans, characterized by clearness and soundness of views, and in 1817 he was elected to represent the department of the Seine in the chamber of deputies. Here he was no less distinguished as the firm and eloquent advocate of constitutional principles than as an enlightened and sagacious financier. In the revolution of 1830 he took a decided part in favour of the national liberties; was one of the deputation appointed to wait on Marshal Marmont during the three days; a member of the

municipal commission of the provisional government, but did not sign their declaration of the dethronement of Charles X. When Charles made his last effort to retain the throne, he ordered the duke of Mortemart to form a ministry, who made M. Périer minister of finance, and General Gérard that of war. In August 1830 Périer was chosen president of the chambers, and on the 12th formed one of the first cabinet of the new king, without holding the portfolio of any department. In March 1831 he succeeded Laffitte as president of the council, with the department of the interior; Louis being minister of finance, Sébastiani of foreign affairs, and De Rigny of the marine. The chief endeavour of M. Périer's ministry appeared to be to keep France at peace with Europe, and thereby to make commerce and manufactures flourish, to establish civil liberty, and repress the military spirit; and secondly, to render the government more firm. The opposition reproached him with ignominiously courting the favour of the absolute monarchs, with having deprived France of the honourable and elevated position due to her in the European system, with being unwilling to follow up frankly the principles of the "July revolution," and with having sacrificed Italy to Austria, and Poland to Russia. M. Périer died from the effects of the cholera in May 1832.

PERIGORD, CARDINAL, a French ecclesiastic, who was born at Paris in 1736, and christened Alexander Augustus Talleyrand. Descended from one of the most illustrious families in France, he was, after an education worthy of his rank and of the profession which he intended to embrace, soon promoted to a bishopric and raised to the dignity of archbishop of Rheims, which entitled him to anoint the princes of his country. He was adorned by virtues that reflected honour on the clergy, whom he dignified by his devotion, and also by the exercise of those eminent qualities which distinguished an ecclesiastical prince.

"The Drapeau Blanc," when speaking of him says, "Faithful to his principles, to the interests of the state, and to the reverence due to the monarch, he, alike in 1787 (during the assemblage of the nobles), and in 1789 (during the meeting of the states general), repelled with firmness those pernicious innovations which have since occasioned so much blood, and caused so many tears to France! When he perceived that every thing was indeed lost, that rebellion had supplanted and overturned the throne itself, he retired in the commencement from the theatre of such discord and crimes, and took refuge, in the first instance, in Germany. From thence he repaired to England, the only spot where, at the height of their calamities, the royal house of Bourbon could find an asylum. Here the archbishop of Rheims participated in the long exile of that illustrious house; and when Divine Providence, in kindness to the wishes of its servants, was pleased to restore the descendants of St. Louis to the throne of their august ancestors, he accompanied them. But the ancient see of Rheims was no longer to be found; that see, honoured by the virtues of St. Remy, had been suppressed by an authority that trembled at every thing calculated to revive the recollection of legitimate monarchy. It was thus that the king, regarding his high qualities, now appointed him grand almoner; the sovereign pontiff then decorated him with the Roman purple; and Paris congratulated herself on

her spiritual head. Notwithstanding his advanced age, he discharged with an apostolic zeal the numerous duties which his exalted situation had imposed. His time was devoted to beneficence, even to the moment when, seized by sickness, he was taken from this terrestrial state. His decease is matter of deep regret to all friends of religion and virtue. The clergy, his family, and the faithful of his diocesan flock, weep for him; while the poor, inconsolable at their loss, demand a new father."

This learned and pious prelate died in 1820. The funeral of Cardinal Perigord took place in Paris, in the cathedral at Notre Dame, with all the pomp the solemnity of the occasion would admit. A battalion of the garrison fired a volley on the taking up the body, on its entrance into the cathedral, and on its being placed in the vault. His eminence bequeathed almost the whole of his fortune to religious establishments, and to the poor of the diocese of Rheims and Paris. To his domestics he left legacies proportionate to the extent of their service.

PERIZONIUS, JAMES, a learned Dutch philologist of the seventeenth century. He was born at Damme in 1651, studied at Deventer and Leyden, and became professor of history, rhetoric, and Greek, at the latter place, where he died in 1715. His historical and philological works are numerous. The principal are, "*Animadversiones Historiæ*," a treasure of learning; "*Origines Babylonicæ et Ægyptiacæ*;" editions of *Ælian's "Various Histories,"* of "*The Minerva of Sanctius*," &c.

PERKINS, DR. ELISHA, an American physician, who was the inventor of the metallic tractors, was born at Norwich, Connecticut, in January 1740, and was educated by his father, Dr. Joseph Perkins, for the profession of medicine. He was indebted to nature for uncommon endowments, both bodily and mental. In person he was six feet high, and of remarkable symmetry. His reputation and success as a physician were considerable, but he is principally known by his metallic tractors. These were formed by him from a composition which he discovered after numerous experiments with various kinds of metals during several years, he having conceived the idea that metallic substances might have an influence on the nerves and muscles of animals, and be capable of being converted to useful purposes as external agents in medicine. They consisted of two instruments, one of the appearance of steel, the other of brass, and were about three inches in length, and pointed at one end. The manner in which they were applied was, by drawing the points over the affected parts in a downward direction, for about twenty minutes each time. The complaints in which this operation was found most useful were, local inflammation in general, pains in the head, face, teeth, breast, side, stomach, back, rheumatism, &c. Dr. Perkins procured a patent for his discovery, and the success which it obtained was great, not only in America, but on our side of the Atlantic. The professors of three universities in America gave attestations in favour of its efficacy. In Copenhagen, twelve physicians and surgeons, chiefly professors and lecturers in the royal Frederic's hospital, commenced a course of experiments, accounts of which were published in an octavo volume. During the prevalence of yellow fever in New York in 1799, Dr. Perkins went thither for the purpose of testing the merits of a highly antiseptic remedy which he

had introduced into practice; but after about four weeks of unremitted assiduity in attending the sick, he took the disease himself, and died at the age of fifty-nine years. He was a man of great liberality of character and of strict honour and integrity.

PERRY, SAMPSON, an English political writer of considerable celebrity. He was born at Aston, near Birmingham, and educated for the medical profession. His life had been full of vicissitudes, and he had many narrow escapes in situations of great danger. He was many years surgeon to the Middlesex militia, and a vender of a nostrum for the cure of the stone and gravel; but devoting himself to political pursuits, he became in 1796 the editor of a paper called "*The Argus, or General Observer of the Moral, Political, and Commercial World*." This publication, at the commencement of the French revolution, was distinguished for its industry in disseminating republican doctrines. For a libel in this journal the publisher was prosecuted and convicted, on which he withdrew to Paris, where he contracted an intimacy with Thomas Paine; but the reign of terror made that capital too dangerous for him. He was imprisoned nine times in French prisons, and during the reign of Robespierre he was confined with Paine, and was by Robespierre condemned to death without the then thought unnecessary form of trial. He escaped his dreadful doom by the following singularly fortunate circumstance: his prison or cell-door was hung upon a swivel, and by the least motion would turn round any way. The custom was to mark with red chalk the doors of the cells of those who were condemned to death, and his door was marked: but the turnkey, leaving the cell in the morning appointed for execution, accidentally let the door turn round, not observing that the door was thus reversed, and that the "mark of death" was inside instead of being out. Before he noticed the circumstance the officers of execution arrived to take from every cell marked with red chalk the victims of revolutionary fury; and perceiving Mr. Perry's cell not marked they passed it, and when the gaoler again came round and opened the door, he was thunderstruck on finding Mr. Perry and Paine alive; but ere he had time to apprise any person he was shot by some of the infuriated mob who had just burst open the prison, and who liberated the captives just as the monster Robespierre was led bleeding to the scaffold.

After this Mr. Perry returned to England, where he was taken up on the outlawry which he had incurred by not appearing for judgment on his former conviction. He remained in Newgate till a change in the ministry, and then was liberated. During this period he maintained his wonted spirit, and employed himself in translating from the French and in a variety of literary works. He afterwards purchased "*The Statesman*," which he edited for two or three years, and then re-sold. Mr. Perry died early in 1823.

PERRY, JAMES, a political writer, who was born in Aberdeen in 1756, and received his education at the Marischal college in his native place. Having completed his studies he came to London, and soon after became a writer in "*The General Advertiser*" and "*London Evening Post*." In both of these he distinguished himself by great promptness in attending to the popular proceedings of the period. In 1782 he projected, and was the first editor of "*The European Magazine*;" he however quitted that work to

edit "The Gazetteer," and soon after purchased "The Morning Chronicle," which, under his management, became the organ of the Whig party. After his death, which took place at Brighton on the 4th of December, 1821, that paper gradually lost its peculiar tone of politics, which may be partly ascribed to the changing of hands, and partly to the Whigs having merged into a more general party distinction.

PERSIUS, AULUS PERSIUS FLACCUS, a Roman satirical poet, who was born A. D. 34, at Volterra in Etruria. According to some, Luna was his birth-place. His family was of the equestrian order, and he received his education at Rome. He was on friendly terms with some of the most eminent men of the time, and was much beloved on account of the purity and amenity of his manners. He died at the age of twenty-eight years. The stoic Cornutus, one of his first teachers, published six satires by him, which present a picture of the prevailing corruption, in contrast with the standard of the stoic wisdom and the old Roman severity. They are distinguished for vigour, conciseness, and austerity of tone. Their obscurity arises in part from their allusions to subjects now unknown, and in part from their abrupt and concise style. They are usually published with the Satires of Juvenal. The best editions are those of Casaubon and König with commentaries. Dryden and Gifford, among others, have translated them into English. Madan's edition of "Juvenal and Persius," with a prose translation and English notes, was reprinted in 1813.

PERTI, GIACOMO ANTONIO, was born at Bologna in 1656, and was one of the greatest professors of the ancient school of music in that city. His compositions for the church are considered as classical. He was first in the service of the princes of Tuscany, and from thence was invited by the imperial court to Vienna, in which city he resided nearly the whole of his life. He formed many eminent pupils, at the head of whom may be placed the celebrated Padre Martini. His pupil, Padre Martini, published in his "Saggio di Contrapunto," seven chef d'œuvres in sacred composition by his master Perti; and Paolucci, Padre Martini's pupil, also published four sacred pieces by Perti, in his "Arte Pratica di Contrapunto."

PERUGINO, PIETRO VANUCCI, surnamed Il Perugino.—This celebrated artist was the founder of the Roman school of painting. He was born at Città della Pieve in 1446, and received the rights of citizenship in Perugia (whence his surname), and at an early age distinguished himself by his works. Bonfigli and Pietro della Francesca were probably his masters. His pictures have much grace, and are particularly successful in female and youthful figures. The turns of his heads are noble, and his colouring is lovely. A certain hardness and dryness in the forms, and poverty in the drapery, were the faults of his age, from which he did not wholly escape. Tranquillity and childish simplicity characterize his works, which are, however, defective in invention. His frescoes are softer and in better keeping than his other productions, as the fine specimens in Perugia, Rome, Bologna, and Florence prove.

PESCETTI, GIOVANNI BATTISTA, a celebrated Venetian composer and pupil of Lotti. Immediately on the completion of his education, he composed a grand mass at Venice, at the beauty of which

Hasse, who was present, was much surprised, and said, "Nature has shortened for him the road to his art." About the year 1737 he came to London, where he resided two or three years. On his arrival his opera of "Demetrio" was performed at the King's theatre, and had a run against Handel's opera of "Giustina," which was brought out at the same time at Covent Garden. He also produced a serenata called "Diana et Endimione," which was sung at the King's theatre in 1739. He in the same year published nine "Sonate per il Cembalo." Among his other operas we can name, "Il Prototipo," "La Cantatrice," "Doriinda," "I tre Difensori della Patria," "Alessandro nell'Indie," "Tullo Ostilio," and "Ezio."

PESTALOZZI, JOHN HENRY, one of the most distinguished men of modern times for his efforts in the cause of education. He was born in January 1746, at Zurich in Switzerland, and was educated by pious relations after the death of his father, who had been a physician. Even when very young he manifested strong religious feelings, a quick sense of right, compassion towards the poor, and a fondness for young children. He had a great inclination for the study of languages and theology; but, after an unsuccessful attempt to preach, he studied law. Some treatises of his on "Preparation for a Profession," and on Spartan legislation, and the translation of some speeches of Demosthenes, which he published, were proofs of his diligence and talents. But Rousseau's "Emile" filled him with a dislike for the habits of a learned life, and for the general system of education in Europe; and a dangerous illness, occasioned by excessive study, induced him, immediately after his recovery, to burn the greater part of the extracts and collections, which he had made during his study of the history of his country and of law, and to become a farmer. He studied agriculture with a farmer near Berne, and then bought a piece of land in the neighbourhood, built a house, which he called Neuhof, and began the life of a farmer when he was twenty-two years old. He soon married, and became concerned, through his wife's relations, in a calico manufactory. In these situations he became acquainted with the moral wretchedness of the lowest classes, and in 1775 began his career of instruction by the admission of the children of paupers into his house.

He soon saw himself surrounded by more than fifty children, to whom he was a teacher and a father. He had no aid from others, and though he worked with the children when he was not employed in teaching them, or in his private affairs, he had not the practical talent necessary to turn the labour of his little workmen to account. His philanthropic and noble self-denial was derided; his confidence was abused; his own affairs declined; and he was generally considered as a well-meaning enthusiast. But he had formed his purpose, and was not to be diverted from it; and, amidst straitened circumstances, he collected that knowledge of the state of the lower classes which is set forth so admirably in his novel "Lienhardt und Gertrud," a work which has exercised a remarkable influence. The description in this work of the school at Bannal contains many characteristic traits of Pestalozzi's life at that time at Neuhof. To illustrate this novel he wrote in 1782 "Christoph und Else," besides "Abendstunden eines Einsiedlers," in Iselin's "Ephemeriden," in which he gives the first account of his method; a "Schwei-

zerblatt für das Volk;" "A Treatise on Legislation and Infanticide," and "Inquiries into the Course of Nature in the Development of Man," which are full of thought. The latter work was written at a time when Pestalozzi had suffered many vexations and misfortunes. The want of all support at last obliged him to give up an undertaking which was too great for the means of an individual. In 1798 the directory of Switzerland invited him to establish a house of education at Stanz for poor children. He became here the teacher, father, and, we must add, servant to eighty children, of the lowest classes. But war, and the efforts of a party unfriendly to his scheme, destroyed this establishment after a year. Pestalozzi now took charge of a school at Burgdorf, where he also received pupils, who paid for their instruction, so that he was enabled to employ able assistants.

A publication on the application of his method by mothers, which appeared in 1801, under the title "How Gertrude Teaches her Children," and the elementary books, "Book of Mothers," and the "Anschauungslehre der Zahlenverhältnisse, or the Doctrine of Numerical Relations conveyed by Perceptions of Form," found many well-disposed readers. But Pestalozzi brought new vexations on himself by mingling in politics. He was a decided democrat and man of the people, who in 1802 sent him as their delegate to the first consul; and in 1802 he published his "Views on Subjects to which the Legislature of Helvetia should chiefly direct its Attention," which made the higher classes unfriendly to him. His institution in the mean while flourished. In 1804 he removed with his school to Munchen-Buchsee, where he entered into a nearer connexion with Fellenberg, and in the same year to Yverdon, where he occupied the castle given to him by government. Pestalozzi's method has become the subject of animated discussion since the beginning of the nineteenth century, partly owing to the opposition which new schemes always meet with, and partly to the extravagance of his admirers. Pestalozzi was a man of great genius and depth of feeling, full of the spirit of self-sacrifice, devoted to the noble purpose of aiding mankind in the most effectual way by the instruction of the poor and abandoned, in which he was warmly engaged until his death. He loved liberty, and believed that its cause would be most promoted by the education of the most neglected. His genius, moreover, enabled him to devise the most effectual plans for obtaining this end. But he was not sufficiently practical, properly to direct the economy of a large establishment for instruction, and to employ to the most advantage the talents of many teachers. He was void of worldly prudence, and this want was an abundant source of vexation to him and others throughout his life. The idea of communicating all instruction by immediate address to the sensations or conceptions, and effecting the formation of the child's mind by constantly calling all his powers into exercise, instead of making him a mere passive recipient, selecting the subjects of study in such a way that each step shall best aid the further progress of the pupil, is original with him. It is not the acquisition of skill in reckoning, reading, writing, drawing, singing, &c., but the exercise of the powers of the child by means of these subjects, which Pestalozzi makes the object of elementary education. The principles of his method are clearly developed in his "Wochenschrift für Menschenbildung." This publication, with the

reply of his assailant, Niederer, to the "Report on Pestalozzi's Institution at Yverdon," "Gründer's Letters from Burgdorf," and Johannsen's "Criticism of Pestalozzi's Method," afford a satisfactory view of his system. He himself did not consider his system entirely complete. From Spain, France, Prussia, and many other countries, testimonies of honour and regard were sent to him from the governments; and his pupils have spread as far as European civilization extends. His exterior was extremely simple. His negligent black dress, his broad Swiss dialect, and blunt manners, without any kind of ceremony, showed the honest Swiss. In 1818 he undertook a new edition of his complete works, the proceeds of which he destined for a new school for poor children. He died, February 17th, 1827, at Brugg in Aargau.

PETER I. ALEXIEWITSCH.—This great czar and emperor of Russia was born at Moscow on the 30th of May, 1672. He was the eldest child of the czar Alexis Michailowitsch, by his second wife, Natalia Kirilowna, daughter of a Russian boyar. Blessed with a healthy constitution and a vigorous mind, Peter attracted general attention while he was but a child; and Alexis wished to pass by his two elder sons, the sickly Feodor and the feeble Ivan, and appoint Peter his successor; but the ambitious Sophia, daughter of Alexis by his first marriage, prevented the elevation of her half-brother. Feodor III. however, the successor of Alexis, passed over Ivan, and named Peter, yet a minor, his successor. On the death of Feodor, Peter was accordingly proclaimed czar, but Sophia excited a rebellion of the Strelitzes by the report that Ivan had been put to death by Peter and that her own destruction was resolved upon. When Ivan afterwards appeared the Strelitzes exclaimed "Thou art our czar!" "I will be so," answered the trembling Ivan, "only on condition that my dear brother shall share my throne." Peter was therefore crowned with Ivan on the 23rd of June, 1682. The Strelitzes again rebelled, but Peter escaped with his mother to a monastery, which protected him from the fury of the insurgents. In the meantime the cavalry of the czar hastened to his rescue and overpowered the rebels, thirty of whom were beheaded to prevent future seditions. But Sophia, taking advantage of the weakness of Ivan and the youth of Peter, became constantly more assuming: her name was finally subscribed to the imperial ukases with those of the two czars, and her image was stamped on the reverse of the coins. Peter, meanwhile, was silently developing his manly and warlike spirit. He formed two companies of soldiers from the young men of his own age, in whose ranks he himself served. Their commander was the young Lefort. Sophia considered this amusement as well calculated to remove her brother from state affairs, and heard with pleasure of the excesses in which Peter and his favourites indulged. But the accomplished and enthusiastic Lefort was instilling a large amount of valuable knowledge into the mind of the inquisitive czar, in whom the early instructions of Sotow, an experienced diplomatist, and Francis Timmermann, a German mathematician, and the lessons of his mother, had already laid a solid foundation for the improvement of his mind and the formation of his character. Sophia herself soon perceived his superior talents, when, in the beginning of 1688, he appeared for the first time in the privy council.

immediately taken for the residence of the czar and his suite; and a doorway was broken through the boundary wall of the dock-yard to afford a direct communication between it and the dwelling-house. This place had then the name of Saye's Court; it was the delight of Evelyn, and the wonder and admiration of all men of taste at that time. The grounds are described in "The Life of the Lord Keeper Guildford" as "most boscaresque, being, as it were, an exemplary of his (Evelyn's) book of forest trees." Admiral Benbow had given great dissatisfaction to the proprietor as a tenant, for he observes in his "Diary"—"I have the mortification of seeing, every day, much of my labour and expense there impairing from want of a more polite tenant." It appears, however, that the princely occupier was not a more "polite tenant" than the rough sailor had been, for Mr. Evelyn's servant thus writes to him,—"There is a house full of people *right nasty*. The czar lies next your library, and dines in the parlour next your study. He dines at ten o'clock and six at night; is very seldom at home a whole day; very often in the king's yard, or by water, dressed in several dresses. The king is expected there this day; the best parlour is pretty clean for him to be entertained in. The king pays for all he has." But this was not all: Mr. Evelyn had a favourite holly hedge, through which, it is said, the czar, by way of exercise, used to be in the habit, every morning, of trundling a wheel-barrow. Mr. Evelyn probably alludes to this in the following passage of his "Sylva," wherein he asks, "Is there under the heavens, a more glorious and refreshing object, of the kind, than an impregnable hedge, of about 400 feet in length, nine feet high, and five in diameter, which I can still show in my ruined garden at Saye's Court (thanks to the czar of Muscovy!) at any time of the year, glittering with its armed and variegated leaves, the taller standards, at orderly distances, blushing with their natural coral?"

"Alas for the glory of the glittering hollies, trimmed hedges, and long avenues of Saye's Court! Time, that great innovator, has demolished them all, and Evelyn's favourite haunts and enchanting grounds have been transformed into cabbage gardens; that portion of the victualling-yard where oxen and hogs are slaughtered and salted for the use of the navy, now occupies the place of the shady walks and the trimmed hedges which the good old Evelyn so much delighted in; and on the site of the ancient mansion now stands the common parish workhouse of Deptford Strond. We have little evidence that the czar, during his residence here, ever worked as a shipwright; it would seem he was employed rather in acquiring information on matters connected with naval architecture from that intelligent commissioner of the navy and surveyor, Sir Anthony Deane, who, after the marquess of Carmarthen, was his most intimate English acquaintance. His fondness for sailing and managing boats, however, was as eager here as in Holland; and these gentlemen were almost daily with him on the Thames, sometimes in a sailing yacht, and at others rowing in boats,—an exercise in which both the czar and the marquess are said to have excelled. The navy board received directions from the admiralty to hire two vessels, to be at the command of the czar whenever he should think proper to sail on the Thames to improve himself in seamanship. In addition to these, the king made him a present of the Royal Transport, with orders to

have such alteration and accommodations made in her as his czarish majesty might desire, and also to change her masts, rigging, sails, &c., in such way as he might think proper for improving her sailing qualities. But his great delight was to get into a small decked boat belonging to the dock-yard, and taking only Menzikoff, and three or four others of his suite, to work the vessel with them, he being the helmsman; by this practice he said he should be able to teach them how to command ships when they got home. Having finished their day's work, they used to resort to a public-house in Great Tower Street, close to Tower Hill, to smoke their pipes and drink beer and brandy. The landlord had the czar of Muscovy's head painted and put up for his sign, which continued till the year 1808, when a person of the name of Waxel took a fancy to the old sign, and offered the then occupier of the house to paint him a new one for it. A copy was accordingly made from the original, which maintains its station to the present day, as the sign of the 'czar of Muscovy,' looking like a true Tartar. His attention was forcibly attracted to the magnificent building of Greenwich Hospital, which, until he had visited it, and seen the old pensioners, he had some difficulty in believing to be any thing but a royal palace. King William having one day asked him how he liked his hospital for decayed seamen, the czar answered, 'If I were the adviser of your majesty, I should counsel you to remove your court to Greenwich, and convert St. James's into a hospital.'

He took into his service upwards of 500 persons—officers, engineers, cannoneers, surgeons, &c. He received a doctorate from the university of Oxford, and after a stay of three months, went through Holland and Dresden to Vienna. But an insurrection of the Strelitzes induced him to hasten home, and he arrived at Moscow, September 4th, 1698. The insurrection had already been suppressed by Gordon, but Peter erected a bloody tribunal; every day of the succeeding month saw the blood of the rebels flow; and as there were the strongest reasons to suspect his sister Sophia of being the author of this disturbance, he caused twenty-eight gibbets to be erected and 130 of the conspirators to be executed before her monastery; and three of them, who had drawn up a petition to Sophia, were hung before the windows of her cell with the petitions in their hands. Five hundred were banished; the corps of Strelitzes was abolished, and the last remains finally became extinct in Astrachan in 1705. It was probably merely from personal dislike that he accused his wife Eudoxia, who was impatient of his amours, of being engaged in the conspiracy. She was banished to Suzdal, where she was obliged to take the veil, under the name of Helen. To reward his faithful adherents he established the order of St. Andrew in 1698, which Golowin was the first to receive. The death of his favourite Lefort and of Gordon plunged him into the deepest grief. Menzikoff, who rose from obscurity by his talents and activity, now became the favourite of Peter. He supplied the place of the Strelitzes by twenty-seven new regiments of infantry and two of dragoons, who within three months were disciplined and brought into marching order. Nothing but merit and length of services was regarded in the appointment of officers. Peter devoted himself with incessant activity to the internal regulation of his empire, which assumed, by degrees, the appearance of a new creation. The man-

ner o. collecting the public taxes was simplified; the German costume was introduced; beards began to disappear; the numerous retinue of the boyars was diminished; foreign travel was in a manner necessary to secure the prince's favour; printing presses were set up and useful works introduced; schools were established in all the large towns, and new ecclesiastical institutions organized. When the patriarch Adrian died at Moscow in 1700, the czar left this office, but little inferior in authority to the papal, unfilled. The armistice of two years between Russia and Turkey, stipulated in the peace of Carlovitz, between the Porte and Austria, was prolonged to thirty years; but at the same time war was declared against Sweden. Patkul had now matured the alliance of the czar with Augustus, king of Poland, and no indications of good will on the part of the young Charles XII. of Sweden could divert Peter from his designs. Peter occupied Ingria, and attacked Narva. The young king of Sweden flew to its relief, and defeated 38,000 Russians with 8000 Swedes, November 30th, 1700.

This defeat did not shake the resolution of Peter. "I know," said he, "that the Swedes will often defeat us, but we are learning. Our turn to conquer will come at last." Fresh troops were immediately assembled, arms were provided, and the victory of the Russians over the Swedes on the Embach laid the first foundation for their future triumphs. Noteburg and Marienburg were taken; among the inhabitants of the latter, who were carried into Russia, was the orphan Catharine. After a triumphal entry into Moscow, and a short delay at Woronez, Peter returned to the theatre of the war on the Baltic, where Menzikoff had been throwing up fortifications for the protection of the new docks at the influx of the Olonza into Lake Ladoga. For the same purpose, on the 1st of May, Peter took Nyenschantz, a fortress at the mouth of the Neva. Four days after, with thirty small vessels, on board of which he served as captain of bombardiers, he took two Swedish ships of war at the mouth of the same river. To reward him for his services on this occasion Admiral Golowin created him knight of St. Andrew. As Nyenschantz was too far from the sea, and not sufficiently secure, Peter determined to construct a new fort to protect the mouth of the Neva. He here built a small wooden hut in the Dutch style, from which he superintended his new work. May 27th, 1703, the foundation of the fortress was laid, which the czar called St. Petersburg. The work was commenced under the direction of an Italian architect, and 20,000 men, from every part of the empire, were soon employed upon it. While engaged in this work he determined to build a city, which should serve as a commercial emporium to connect Russia with the rest of Europe. In four months the fortress of St. Petersburg was completed, and the city was also gradually rising. Many of the workmen, unwilling to undertake the long journey to their homes, settled here, where they were besides welcomed by the czar, as they were serviceable in erecting houses for the rich. Many Swedes, Finns, and Livonians, driven from home by war, eagerly hastened to the new city, where they received the land in their own right, so that in two years, besides Vasili-Ostrov, where the first private houses were built, the island of St. Petersburg and the admiralty-quarter were settled. Under the direction of Menzikoff the fortress of Cronschlot arose from the sea, at a short distance, for the protection of Petersburg. More than 8000 horses,

and as many men, perished in the labour of transporting the materials for building; but in March of the following year the cannons thundered from the walls of Cronschlot.

In the meantime Austria, Holland, and England made every exertion to destroy the alliance of Peter with Augustus of Poland. Charles left his great enemy in the heart of Livonia, and marched to Saxony to compel Peter's ally to abdicate his throne. Peter, on the other hand, commenced his new operations by the destruction of a Swedish flotilla of thirteen ships on Lake Peipus. Dorpat, Narva, and Ivangorod were captured, and the Swedish army was finally destroyed under the walls of Pultawa on the 8th of July, 1709. The czar, now promoted to the rank of lieutenant-general in the army, and rear-admiral in the fleet, wrote from the field of battle to Admiral Apraxin in Petersburg:—"Our enemy has experienced the fate of Phaeton, and the foundation of our city on the Neva is, at length, firm." Peter immediately hastened back to his favourite city on the Neva, where he made preparations to connect Lake Ladoga with the Wolga, and concluded commercial treaties with France, Italy, and the Hanseatic Towns. Having celebrated his victory by a triumphal entry into Moscow, and re-organized the army, consisting of thirty-three regiments of infantry, twenty-four of cavalry, and 58,000 garrison troops, he commenced his campaign in Livonia and Carelia, which were conquered in 1710. The Turks, instigated by Charles XII., had, meanwhile, declared war against him. Peter immediately established a senate to administer the affairs of the empire, and having restored to the bishoprics and monasteries the property before taken from them in order to gain the favour of the clergy and the nation, he advanced to the Pruth, opposite the camp of Mehemed the grand vizier. The soldiers were here reduced to the greatest extremes from want of provision, and their condition was the more desperate on account of the defection of the prince of Walachia, and his refusal to furnish the promised supplies. Peter, nevertheless, crossed the river, but was forced to retreat, and his exhausted army was surrounded by a numerous enemy. Peter saw nothing before him but captivity or death. He was delivered from this difficulty by his new wife, Catharine, whom he had privately married in 1707, and declared his lawful wife in March 1711. Assisted by the field-marshal, Scheremeteff, she sent to the grand vizier proposals of peace. A large sum of money, and valuable jewels, with promises of further remittances, all without the knowledge of Peter, are said to have accompanied the letter of Scheremeteff to the grand vizier. During this time Peter, despairing of any favourable results from this mission, and reduced to despondency, wrote to the senate in Moscow:—"If I fall into the hands of the enemy consider me no longer as your sovereign, and obey no commands which shall proceed from the place of my confinement, though it should be signed by my own hand. If I perish choose the worthiest among you to succeed me."

In July 1711 the peace of Hus was concluded in spite of all the opposition of Count Poniatowski, the agent of Charles XII. Peter purchased his own safety, and that of his army and empire, by the sacrifice of Azoph. Cantemir, prince of Moldavia, whom Peter refused to give up on any condition, followed the czar, and continued to receive from him a pension until his

death, twelve years afterwards. He now applied himself with great activity to the prosecution of the war in Pomerania against Sweden. To restore his health he went to Carlshad in the summer of 1711, and, on his return to Moscow, publicly solemnized his marriage with Catharine. The translation of the senate of regency to Petersburg took place two months later. In June 1712 he again visited Carlshad with his wife. After having taken the waters three weeks he proceeded to his army in Holstein, where Steenbock, the Swedish general, had obtained some successes over the Danes. He shut up this general in Tönningen, and returned to Petersburg to effect the conquest of Swedish Finland, and in 1713 penetrated beyond Abo to Tavasthus, while the Swedes in Tönningen were compelled to surrender. But the neutrality of Pomerania, proposed by Prussia and consented to by Menzikoff, thwarted his plans; for this act even the intercession of the czarina was hardly able to save the favourite from ruin.

Peter continued his efforts to improve the Russian marine, but he was obliged to submit when the college of admiralty refused to promote him to the dignity of vice-admiral, "because he had not sufficiently distinguished himself at sea to be preferred over other officers." His chief object was now to merit that distinction. Having obtained the naval victory at Twermunde, and completed the subjugation of Finland by the subsequent capture of the fortress of Nyslot, he was received, on his triumphal entry into Petersburg, by the vice-czar Romanadowski, with the salutation, "Hail, vice-admiral!" Perceiving the oppressions exercised by the nobility upon the lower classes, he established a board to inquire into abuses. The investigation ended in the exile to Siberia of a great number of civil officers from the first to the third rank, and strict provisions against future abuses, but he did not consider it prudent to attempt to abolish slavery for the present. He repaired the devastations which the war had caused in Ingria by settling in that country a number of rich peasants from the interior of Russia. He exercised the greatest prudence in regard to the religious contests between the Roskólnicks, those of the ancient faith, and the orthodox, but was obliged to put to death a Roskólnick who sought to obtain a martyr's crown by assassinating the czar. Events of this nature increased Peter's aversion to Moscow, and confirmed his determination to make Petersburg the capital of the empire. All his commercial ordinances, and his measures for the growth and embellishment of the city, were directed to this object. In the midst of these plans he was informed that Charles XII. had returned, and was now in Stralsund. But as this headstrong prince refused to consent to the neutrality of Pomerania, and thus offended England as well as Holland, he prepared for the czar the way to new and easy conquests. Stralsund was taken in December 1715 by the Prussians and the Danes without the aid of Peter; and in the first impulse of anger the czar was on the point of siding with Charles, because his troops were refused admittance into the works, and were even driven back by force. Before his visit to Pymont for the recovery of his health, he agreed with the king of Denmark upon a landing at Schonen, in pursuance of which he went to Copenhagen. Four fleets, Russian, Danish, English, and Dutch, were united, forming a squadron of eighty sail, partly to cover the disembarkation at Schonen, and partly to make head

against the Swedish fleet, which was cruising in the Baltic. The command of the combined fleet was unanimously committed to the czar; and he convoyed one hundred merchant vessels, lying in the sound, by the fleet of Sweden. The landing at Schonen was abandoned by the advice of the Russian generals; this excited suspicions in the mind of the Danish king, and Peter left Denmark and took possession of Mecklenburg.

For the accomplishment of certain political plans, he undertook a journey to Holland and France towards the end of 1716. In Amsterdam, besides the naval and commercial objects of his visit, he also attended to all the subjects of art and science. His wife, who visited him after her delivery in February 1717, remained at the Hague, while Peter, in the beginning of April, went through Brabant to Paris, where he visited all the literary, military, mechanical, and other institutions and collections of art, &c., and concluded a treaty of amity and commerce with France in behalf of himself and Prussia. His main object, the separation of France from England, and his designs on Mecklenburg, were not accomplished. In October 1717 he returned to Petersburg, and instituted investigations into charges of abuses and acts of oppression. Prince Wolkonski, the governor of Archangel, was shot, and military courts were commissioned to inquire into accusations against others. He then went to Moscow to judge his only son Alexis, who was condemned to death by the high officers of the empire. This was one of the greatest stains in the character of Peter. Though pardoned shortly after, he is said to have died of the agitation into which the trial and sentence had thrown him. At his funeral, which was solemnized with great pomp, the czar melted into tears. Many persons, involved in the guilt of Alexis, were executed with great cruelty.

Peter treated with equal severity the nobles who oppressed his people, and did not even spare his favourites Menzikoff and Apraxin. He endeavoured to introduce a more regular administration of justice by the institution of the colleges of the governments and a legislative committee, taking the code of his father Alexis for the basis of his new system. A commercial college was also erected, and the commercial class treated with distinction. His amusements consisted in ornamenting his capital, collecting a cabinet of natural curiosities, encouraging art, and raising the tone of society; he likewise provided amusements for the court and people, by public shows, masquerades, &c., among which the papal election intended to expose the head of the Roman church to ridicule, was particularly remarkable. Peter now landed troops on almost every point of the Swedish coast, and commenced a war of devastation never to be forgotten in the annals of that country. Jealousy of the growing power of Russia united Poland, Prussia, and Denmark with Sweden. But Peter resisted all, and maintained his dignity in a dispute with Austria; he banished the Jesuits from the empire because they meddled with affairs in which they had no concern, and prepared for a conflict with Great Britain. In 1719 all the English merchants in Russia were arrested and threatened with the seizure of their property. Peter was now called to endure the severest trials in the death of Scheremeteff, his companion in arms, and of the heir to the throne, Peter Petrowitsch, his son by Catharine, born in

these intervals he granted full pardon to Menzikoff, at the earnest desire of Catharine. He expressed a wish to speak with his favourite daughter Anna; but when she came the emperor was speechless. He expired on the 8th of February 1725, in the arms of his wife, who had not left him for three nights. Peter was fifty-three years of age, and, according to his physicians, might have lived forty more if he had not so long concealed his disorder. Peter was a man of powerful and original genius, who did every thing himself, and was never the instrument of others. His ardour was joined with prudence and resolution. His violent passions and sensual excesses were the fruits of the barbarism of his nation, his imperfect education, and uncontrolled power. On the centennial celebration of his accession to the throne, an equestrian monument by Falconet, representing him at full speed springing up a rock, with his hand extended, and the inscription "Petro Primo, Catharina Secunda, MDCCCLXXXII.," was exposed to view in Petersburg. It is represented in the previous page.

PETER II., emperor of Russia, grandson of Peter the Great, and son of Alexis, ascended the throne in consequence of the will of Catharine I. in 1727, when but thirteen years old. He died in 1730, of the small-pox, and was succeeded by Anna Ivanowna.

PETER III., FEDROWITCH, emperor of Russia. As the male line of the Romanoffs ceased with Peter II., the empress Elizabeth, daughter of Peter I. and Catharine I., agreeably to the order of succession enjoined by her father, appointed Charles Peter Ulrich, duke of Holstein Gottorp, son of her sister Anna Petrowna and the duke of Holstein, her successor, in 1742; and in 1745 she married him to the princess Sophia Augusta, of Anhalt-Zerbst, afterwards the celebrated Catharine II. Peter III. ascended the throne in 1762. His first step was a reconciliation with Frederic II., to whom he restored the conquered kingdom of Prussia Proper, and sent 15,000 men to assist him. He established some salutary laws; but a conspiracy broke out which put an end to his life after a reign of six months. His predilection for the people of Holstein, his attempts to establish Prussian tactics and to overthrow the privileges of the great, had made him numerous enemies. This conspiracy broke out in the night of the 8th of July, 1762. He abdicated the throne, but could not save his life by this means; and he was killed at Ropsha, a seat of Count Rasumoffsky, on the 14th of July, 1762.

PETER, the apostle (whose original name was Simon), was a Galilean fisherman from Bethsaida. His brother Andrew, having been received by Jesus among his disciples, introduced Simon to the divine instructor. He promptly resolved to leave all and follow Jesus, at whose command he had made a most remarkable draught of fishes. After this event we find him always among the followers of Christ, and one of his most confidential disciples. From the firmness of his faith, Jesus named him Cephas (a rock), and bestowed upon him peculiar marks of affection; yet he never gave him any superiority over the other apostles, as the catholics maintain; nor did Peter himself ever assume it. On the contrary, Jesus reminded him in their presence of his faults and his impetuosity; and in the last dreadful night before the crucifixion, Peter encountered the reproving look of his master, whom he had followed at a distance to the house of the high-priest, and there basely denied him from fear of punishment. Repentance for this crime

purified and strengthened his noble heart, which glowed with a warm love of Jesus. His zeal and eloquence made him often the speaker in behalf of his fellow apostles on important occasions; as, for instance, at the feast of pentecost, after the ascension of Christ, where Peter had the boldness to preach the gospel publicly for the first time, and converted several thousands by his powerful eloquence; and before the Jewish council, where he defended the new faith.

His opinions had great influence in the Christian churches, and on his proposal the apostles and elders of the first synod at Jerusalem resolved that a conformity to the laws of Moses should not be required of the Gentile converts to Christianity. Peter probably travelled through several countries of Middle and Western Asia, as a teacher of Christianity; but the tradition that he went to Rome and was crucified there in the year 67 rests only on the records of the Roman church; on which, also, the pope rests his claims to be considered the successor of this apostle. The two Epistles of Peter in the New Testament were written in Greek and directed to the churches in Asia Minor. In their style and in the exposition of doctrines, they bear strong marks of his ardent mind, hurrying from thought to thought, careless in expression, but still animated and forcible.

PETER THE HERMIT, an enthusiastic monk of Amiens, who, about the close of the eleventh century, roused Europe to the first crusade. Peter, who had made a pilgrimage to Jerusalem, instigated by the difficulties he had undergone, flew at his return to Pope Martin the Second; and under the auspices of that pontiff, preached to an assembly of more than 4000 of the clergy, with 30,000 laymen, that met at Piacenza, the wild project of driving the Mohammedans from Jerusalem. The success of his enthusiastic harangues was proportionate to the boldness of his scheme and the ignorance of his auditors. Peter himself led the way through Hungary, at the head of an undisciplined multitude of more than 300,000 men, a comparatively small number of whom survived to reach the city. Peter distinguished himself by his personal courage at the storming of the holy city; and having witnessed the accomplishment of his undertaking, returned to his native country, where he founded the abbey of Noirmoutier, and died its first superior.

PETERBOROUGH, CHARLES MORDAUNT, EARL OF, a son of Lord Mordaunt, whom he succeeded in his title and estate in 1675. He was engaged in the expedition to Tangier in 1680, in which he served with distinction against the Mohammedans. He went over to Holland in the reign of James II., and entering into the scheme of his dethronement, returned to England with his successor, by whom he was created earl of Monmouth, and appointed first commissioner of the treasury. He succeeded to the earldom of Peterborough on the death of his uncle, in 1697, and was subsequently employed as commander of the English army in Spain, in the war of the Spanish succession. He distinguished himself greatly by his courage, activity, and conduct in taking Barcelona, and obtaining many other advantages over the French; in consequence of which he was appointed generalissimo of the imperial forces, and received the thanks of the British parliament. In the reign of George I. he was made a knight of the Garter, and received the appointment of general of marines. His death took place during a voyage to

Lisbon in 1735. Lord Peterborough was intimate with his literary contemporaries, and was himself a writer of poetry, some of which has been published. In "The Correspondence of the Countess of Suffolk," edited by Mr. Croker, are several of his letters.

PETERS, HUGH, was born at Fowey, in Cornwall, in 1599, and in 1622 took his degree of master of arts at Trinity college, Cambridge. After obtaining a license, and preaching in London with great success, he removed to Holland, and several years afterwards to America, on account of his nonconformity. In 1636 he was entrusted with the charge of the church at Salem, and remained there five years. He did not, however, confine his attention exclusively to spiritual concerns, but took an active interest in mercantile and civil affairs; he assisted in reforming the police of the town, suggested the plan of the fishery and of the coasting and foreign voyages, procured carpenters, and engaged in trade with great success.

In 1641 he came to England on a mission to procure an alteration in the laws of excise and trade, but never returned. During the civil war he advocated the cause of parliament by his preaching, and was appointed by Cromwell one of the licensers of ministers, and also a commissioner for amending the laws, though totally disqualified for such employment. After the restoration he was tried for conspiring with Cromwell and compassing the king's death, and was executed on the 16th of October, 1660, aged sixty-one years. He is accused by Burnet of having pressed the condemnation of the unfortunate Charles; but he himself declared in his will that he opposed it. He was a man of no learning, but of impetuous zeal and peculiar native vigour of mind. His sermons, several of which were published, produced a great effect upon the populace by their striking though vulgar eloquence. His coarse and familiar images never failed to answer their purpose; and he possessed the faculty of associating his thoughts in such a manner as to prevent them from being easily forgotten.

PETHION, or PETION DE VILLENEUVE, JEROME, a French revolutionary statesman, who was originally an advocate at Chartres, and was chosen deputy by the *tiers état* of that city to the states-general. The character, conduct, and talent, of Pethion have been variously represented; but his great influence over public affairs is a proof that he was not destitute of ability. In the early part of his career he acted with Mirabeau, but did not join in such of his measures as were calculated to impede the extension of liberty and equality of rights. In October 1789 he was appointed a member of the first committee of general safety, and in December 1790 was elected president of the national assembly. In June following he became president of the criminal tribunal of Paris, and, together with Barnave and Latour-Maubourg, was appointed commissioner to attend the return of the monarch. He was elected mayor of Paris in November 1791, and, in consequence of his implication in the attack on the Tuileries, June 20th, 1792, was suspended from his functions July 6th, but restored by the assembly on the 13th. His behaviour on the 10th of August has, by some, been interpreted as the result of weakness, and by others as the effect of design, to avoid betraying his character as an abettor of the violence. Being nominated a deputy from the department of Eure and Loire to the convention, which met in September, he became the first president

of that assembly. Soon after the death of the king Pethion was accused of having contributed to the massacres of September; but against this charge he successfully defended himself. He now, however, became the object of jealousy to Robespierre, and was included in the proscription of the Girondists in May 1793. He made his escape, with some other deputies of the same party, to the department of Calvados, where they in vain endeavoured to avail themselves of the insurrections against the terrorists. Some time after the body of Pethion, with that of Buzot, one of his confederates, was found in a field in the department of the Gironde, half devoured by wolves, and it was supposed that he had perished from hunger.

PETION, ALEXANDRE.—This celebrated president of the southern parts of the island of Hayti, was a mulatto, and received his education in the military school of Paris. Being a man of cultivated understanding and attractive manners, and, moreover, well instructed in the art of war, he served in the French, and afterwards in the Haytian armies, with success and reputation. He was in high credit as a skilful engineer, in which capacity he rendered the most essential services to Toussaint and Dessalines, from whom he received many marks of attention and rapid advancement in his profession. He succeeded Clervaux in the government of Port au Prince, and the command of the mulattoes, and held this post at the time of Dessalines' death. Petion was highly respected by the people for his talents and virtues; and upon the dissolution of the government by the death of Dessalines, the people of colour rallied around him as their chief in preference to Christophe, who became the leader of the blacks. Christophe, deeming himself entitled to the undivided succession of Toussaint and Dessalines, the two chiefs took up arms and had many encounters, in one of which particularly, a pitched battle, fought January 1st, 1807, Petion was defeated and pursued by Christophe to the very gates of Port au Prince. This campaign secured to Christophe a decided and unquestioned ascendancy in the northern part of the island, where his chief strength lay. Still Petion's personal popularity, and the hostility of the mulattoes to the negroes, enabled him to maintain his ground at the south; and a bloody war ensued between the rival chieftains of several years' duration, favourable in its issue to Christophe on the whole, but not sufficiently so to dispossess Petion of his power. Wearied, at length, of their unavailing struggle, both parties tacitly suspended the contest, and devoted themselves to the improvement of their respective dominions. Petion's government took the form of republican institutions, consisting of himself, as president for life, and a legislative body so constituted as to be completely under his influence. Petion was a man of fine talents and of honourable feelings and intentions, but not well adapted for the station which he was called upon to fill. The Haytians, just liberated from absolute slavery, without the education, habits of thought, moral energy, and rectitude of character, which are necessary in a government perfectly republican, stood in need of a ruler less kind, gentle, and humane than Petion. In consequence of this his people relaxed in their attention to agriculture, his finances became disorganized, and his country impoverished; and, disheartened at a state of things which he saw no means of remedying, he sunk into a state of despondency, which ended in voluntary death.

His final illness lasted only eight days, during which he resolutely refused all remedies and every species of aliment, even to water; dying, at length, of mere inanition and despondency. His physicians, upon examining his body after death, found all its functions perfectly sound, and without any trace of malady. He died on the 29th of March, 1818, and was succeeded by President Boyer.

PETIVER, JAMES, an English botanist, who practised as an apothecary in London. He was a celebrated collector of natural curiosities, and formed a museum, of which he published an account. He was for many years a fellow of the royal society, and, in conjunction with Mr. Ray, he prepared for the press his "History of Plants." Mr. Petiver died in April 1718, and his collections were purchased by Sir Hans Sloane. He published several works on botany besides the one already mentioned.

PETRARCH, FRANCIS.—This extraordinary poet and restorer of literature in modern Italy was born at Arezzo in 1304. His father had been a notary in the city of Florence, but had been banished during the infancy of his son, who was brought up till he was seven years of age at Ancise in the valley of the Arno. After this period the father, losing all hope of settling again in Florence, from which the violence of a political faction had removed him, departed with his family to Avignon, whither the holy see had been transferred from Rome. Here young Petrarch first commenced his friendship for Gui Settimo, the son of a Genoese, with whom his father was acquainted, and a youth of about his own age. From Avignon, however, both families shortly removed to Carpentras, a pleasant town a few miles distant; and here Petrarch was placed under the care of Convenole, a Tuscan schoolmaster, of whom Petrarch said many years after, that "he resembled the whetstone which sharpened knives but remained dull itself." Under him, however, and by the aid of the elementary instruction which he had received from him, Petrarch soon left his companions behind him in his scholastic studies, and particularly in his proficiency in the Latin language; and from the age of ten to fifteen he learned as much of grammar, rhetoric, and logic as could be acquired in the schools

BIOGRAPHY.—VOL. II.

of that day. At about this age he appears either to have first received the germ of poetical genius, or at least to have experienced that which chiefly effected its development, from a visit to the celebrated fountain and valley of Vaucluse. Of this beautiful spot we have the following graphic account from the pen of Ugo Foscoli:—"The valley of Vaucluse is one of those works of nature which five centuries have been unable to disturb. On leaving Avignon the eye of the traveller reposes on an expanse of beautiful meadow till he arrives on a plain varied by numerous vineyards. At a short distance the hills begin to ascend, covered with trees, which are reflected on the Sorga, the waters of which are so limpid, their course so rapid, and their sounds so soft, that the poet describes them truly when he says, 'that they are liquid crystal, the murmurs of which mingle with the songs of birds to fill the air with harmony.' Its banks are covered with aquatic plants, and in those places where the falls or the rapidity of the current prevent their being distinguished, it seems to roll over a bed of green marble. Nearer the source the soil is sterile; and as the channel grows narrow the waves break against the rocks, and roll in a torrent of foam and spray, glittering with the reflection of the prismatic colours. On advancing still farther up the river the traveller finds himself inclosed in a semicircular recess, formed by rocks inaccessible on the right, and abrupt and precipitous on the left, rising into obelisks, pyramids, and every fantastic shape, and from the midst of them a thousand rivulets descend. The valley is terminated by a mountain perpendicularly scarped from the top to the bottom, and through a natural porch of concentric arches he enters a vast cavern, the silence and darkness of which are interrupted only by the murmuring and the sparkling of the waters in a basin which forms the principal source of the Sorga. This basin, the depth of which has never yet been fathomed, overflows in the spring, and it then sends forth its waters with such an impetuosity as to force them through a fissure in the top of the cavern, at an elevation of nearly a hundred feet on the mountain, whence they gradually precipitate themselves from height to height in cascades, sometimes showing, and sometimes concealing in their foam, the huge masses of rock which they hurry along. The roar of the torrents never ceases during the long rains, while it seems as if the rocks themselves were dissolved away, and the thunder re-echoed from cavern to cavern. The awful solemnity of this spectacle is varied by the rays of the sun, which towards evening particularly refracts and reflects its various tints on the cascades. After the dog-days the rocks become arid and black, the basin resumes its level, and the valley returns to a profound stillness."

In this beautiful solitude did the susceptible mind of Petrarch become inspired with that fancy and sensibility which constituted through life the source of all his pleasures and all his sufferings. The time, however, shortly arrived when his father thought it necessary to seek an establishment for his son. Science and letters were held in contempt even at Avignon, though the residence of the most polite and witty court in Europe. Law was the only study which led to fortune, and Petrarco observing the talents of his son, hoped he would distinguish himself in that profession, and sent him to study at Montpellier, a town as much celebrated for its beauty and

healthfulness as for the skill of its professors, both in physic and law. The Roman law had been taught there from the twelfth century. Petrarch studied here four years, but it was so much lost time, for he could not be brought to fix his attention on such dry subjects. "I could not," says he in a letter to a friend, "deprave my mind by such a system of chicanery as the present forms of law exhibit." Petrarch perceiving his slow progress, sent him to Bologna, a place of still higher celebrity for persons of this profession; but he succeeded no better there than at Montpellier. His father went to Bologna to remedy, if possible, this evil, which he apprehended would be so fatal to his future pursuits. Petrarch, who did not expect his father, ran to hide the manuscripts of Cicero, Virgil, and some other poets, of whose works he had formed a little library, depriving himself of every other enjoyment to become master of these treasures. Petrarch, having discovered the place in which they were concealed, cast them all into the fire.

Petrarch now, however, yielded to the dictates of filial duty, and, in opposition to all his predispositions and tastes, pressed forward in the study to which his father had appointed him. But nature was always stronger than his efforts, though prompted by so powerful a motive. At this time he became acquainted with two of the best poets of the day among the professors at the university of Bologna, Cino de Peetoye and Cecco de Asoli. It was rather singular that Cino had three pupils who have conferred on him, and their country, and themselves, the highest honour—viz., Petrarch, Boccaccio, and Bartholi. The professors soon discovered the talents and the poetical genius of Petrarch, and directed their endeavours to the cultivation of the latter. But while he was thus vacillating between his inclinations and his duty, he received intelligence of his mother's death and his father, unable to support his loss, survived her but a few months.

After the death of his parents, Petrarch devoted himself entirely to literature, under the auspices of John of Florence, an ecclesiastic with whom he became acquainted; and in such pursuits it is probable that he would have spent an uninterrupted life, but for the circumstance which formed the main era of his history and determined the tenour of his character. This was his meeting with Laura, whose name has ever been inseparably connected with his own, and whose charms he has immortalized in his verses. He first saw her going to the church of St. Claire in Avignon, and immediately became passionately attached to her. She, however, was a married lady, and consequently treated his advances with becoming disregard. About the same time he became acquainted with and joined the household of the Colonna family, and shortly afterwards left Avignon to improve his knowledge and relieve his mind by travelling. This expedient, however, proved utterly ineffectual to banish the recollection of Laura. He returned, composed a multitude of sonnets to her, and at length fled precipitately from Avignon to the solitudes of Vacluse, where he had at first fallen in love with nature, and was followed thither by all the demons which his own morbid sensibility had conjured up.

In his thirty-fourth year Petrarch obtained a small ecclesiastical benefice from Pope Benedict XII., and though he was pressed to reside at Avignon, where the papal court was then held, he preferred the re-

tirement of Vacluse. "Reverend and most dignified prelate, my much honoured lord," says Petrarch to the bishop of Lombes, "you invite me to settle at the court of Rome in Avignon, and fill me with the most brilliant hopes of advancement. Now, had I not previously received many the most unequivocal proofs of your great kindness and affection, I might feel disposed to look upon you as the bitterest enemy your unfortunate friend Francis could possibly have in this world. From the different conversations we have frequently had together, you cannot be ignorant of the great promises I have at times had from his holiness Pope John; insomuch as to raise in my mind a fair expectation of being speedily promoted to some elevated post; and yet here I am, and here I shall ever remain, that poor unfortunate wretch Petrarch. Your long experience in the world must have clearly manifested to you that nothing is more fallacious and deceitful than the flattering promises of a court; and that the most profligate and the most illiterate of mankind, nay, even the most degenerate of the sons of earth, who, either by simony, favour, or adulation, rise to the highest stations and dignities of the church, are the persons best received there. *O tempora! O mores!* You would think me highly culpable were I to obtain any thing good by such indirect courses as these. How is it then possible, my dear Sir, that you, who are a man of high birth, honour, and integrity, can propose to me to re-establish myself in that court where not a single person, professing to be an honest man, and being actually so, would deem it fit to remain without shame to himself, when not actually driven by want so to do? Besides, were it even possible for me to obtain preferment through the munificence of his holiness, still the horrid vices of that court are so revolting to my mind that the very thoughts of them make me sick at heart. Know, that when I withdrew myself from the papal courts, I sang forth the psalm—'When Israel went out of Egypt.' In the cheerful solitudes of Vacluse I enjoy a sweet and undisturbed repose, which affords me sufficient leisure to prosecute my studies in peace and tranquillity; and what I may occasionally have to spare from those studies I pass in relaxation and amusements at Cabrieres. Ah! my friend, were it possible for you to fix your residence in that charming valley of Vacluse, you would not only be disgusted with the papal court, but with all the rest of the world. As to me, it is my firm determination never to behold that court again. Remember me, in the kindest manner, to that most excellent man, Messere Stefano Colonna, your father, as well as to your worthy brother the cardinal, and continue to honour me with your cordial affection. Vacluse, 10th of the Calends of June, 1338."

In tracing the literary career of Petrarch, we must not pass unnoticed his "passion for Laura;" indeed we have already adverted to his first meeting with that lady. On the real happiness of his life we believe it exercised but little influence; but offering a fruitful theme for his pen as a poet, it became by habit the business of his existence. Notwithstanding Petrarch's love of retirement, he still felt a kind of necessity for attracting by all means the sympathy of the world; and the wretchedness that is encouraged by such a vanity is utterly incapable of self-consolation. A refined mind, agitated by a natural quickness of sensations habitually uncontrolled, made him dread, and wish by turns, the possession of

Laura. His passion was protracted by that unmanly irresolution which was the real source of his misery and lamentations. When she disappeared for ever from his eyes, melancholy sensations had long become habitual to him. In the course of the ten following years he wrote the second part of his love-poetry, where he describes Laura as sometimes appearing to him in the middle of the night; at other times "he dissolves into ecstasies," and brings "the third heaven before his eyes" to contemplate the celestial beauties of Laura. Frequently he complains of the fatality which condemned him still to nourish his desires upon the dust of a shadow, and we find him exclaiming,—“What art thou doing? why art thou still musing, O my disconsolate soul? Why dost thou persevere in looking back to the time that cannot return? Thou only addest fuel to the fire in which thou consumest. Let us seek heaven, since nothing pleases us on earth from the day that we saw that beauty which, living and dead, was destined to disturb our repose—” More than twenty years at least after he had lost her, when he was himself on the brink of the grave, and when he was able to think of her with more composure, he drew from his memory a picture more distinct, though not perhaps perfectly true, of the heart, the principles, and the conduct of Laura.

He describes her descending from heaven on the dew the night after she had left the miseries of the world. He says that she appeared before him, stretched forth her hand, and sighing, said: “Recognise the woman who, from the first moment that thy young heart knew her, withdrew thee from the path of the crowd.”—“Whilst my tears testified the sorrow which her loss had occasioned me—‘Thou wilt never be happy,’ said she, ‘while thou art the slave of the world. To a pure mind, death is emancipation from a dreary prison. My loss would give thee pleasure if thou knewest but a small portion of my happiness.’ In uttering these words, she turned her eyes with religious gratitude towards heaven.

“She ceased; and I said to her, ‘Do not the weight of infirmities, and the tortures invented by tyrants, sometimes embitter the agonies of death?’ ‘I cannot deny,’ said she, ‘that death is preceded by acute suffering and by the dread of eternity; but if we place our trust in God, it is but as a sigh. In the flower of my youth, when thou lovedst me the most, life had its greatest charm for me; but when I quitted it, I felt the gaiety of one who leaves the place of his exile to return to his home. I felt no sorrow except pity for thee.’

“‘Ah! but tell me,’ said I, ‘in the name of that fidelity which you formerly knew, and which you now know more certainly in the presence of that Being from whom nothing is hidden, tell me, was the pity which you felt for me inspired by love?’ I had hardly uttered these words, when I perceived her countenance illumined by that heavenly smile which had ever shed serenity over my sorrows, and she sighed. ‘Thou hast always possessed my affection,’ said she, ‘and thou always wilt possess it; but I have deemed it right to temper thy passion by the sternness of my looks. A mother never loves her child more dearly than when she seems to chide it. How often have I said to myself, He is consumed by a raging fire, and I must not therefore let him know what is passing in my heart. Alas! we are little capable of such efforts when we ourselves love and

yet fear. But it was by these means only that we could preserve our honour and save our souls. How often have I feigned anger while love was struggling in my heart. When I saw thee sinking beneath despondency, I gave thee a look of consolation, I spoke to thee. The grief and the dread which I felt must have altered the tone of my voice, and thou must have perceived it. At other times thou wert carried away by rage, and I could control thee by severity only. These are the expedients, these are the arts I have practised. It was by this alternation of kindness and of rigour that I have conducted thee, sometimes happy, sometimes unhappy, wearied in truth, but still I have conducted thee till there is no more any danger: I have saved us both, and my happiness is the greater that I have.’ My tears flowed fast while she spoke, and I answered her, trembling, that I should be rewarded if I might dare to believe her—she interrupted me, and her face reddened as she said: ‘O thou of little faith, wherefore dost thou doubt? My tongue shall never reveal whether thou hast been as dear to my eyes as to my heart. But in nothing have I delighted more than in thy love, and in the immortality which thou hast given to my name. All that I required of thee was to moderate thy excess. In endeavouring to tell me the secret of thy soul, thou openedst it to all the world. Thence arose my coldness. The more thou calledst aloud for pity, the more was I constrained by modesty and fear to be silent. There has been little difference in our sympathy, except that the one proclaimed, and the other concealed it. But complaint does not embitter sufferings, nor does silence soften them.’”

The poet says that they continued this conversation, and he dwells with some complacency on the merit of his poetry, whilst Laura is unable to conceal that jealousy which, although it springs immediately out of selfishness and envy, is always mistaken for the inseparable effect of the deepest attachment. “I would have desired,” she said, “to have been born near thy beautiful country; however, that land in which I have been fortunate enough to please thee, ought to seem fair in my eyes. Haply that heart, whose devotion to me alone is my unfailing delight, would have felt for others.”

“‘O no!’ I cried, ‘the rolling spheres above  
That kindled first the nascent spark to love,  
Whatever clime your heavenly presence own’d,  
Had led me there by sacred instinct bound.’  
“‘Whatever you think, the honour all was mine,’  
The vision answered with a smile divine;  
‘But heedless how the blissful moments fly,  
You see not how Aurora climbs the sky!’”

Her lover then asked her if it would be long before he should rejoin her. Laura departed, saying, “As far as it is permitted me to know, thou wilt remain long upon earth without me;” and indeed Petrarch really survived Laura about twenty-six years.

We now approach the most memorable period in the life of Petrarch, namely, his investment with the laurel crown in the capitol at Rome. It is thus minutely depicted by Gibbon the historian:—“Twelve patrician youths were arrayed in scarlet; six representatives of the most illustrious families, in green robes, with garlands of flowers, accompanied the procession; in the midst of the princes and nobles, the senator, count of Anguillara, a kinsman of the Colonna, ascended the throne; and at the voice of a herald, Petrarch arose. After discoursing on a text of Virgil, and thrice repeating his vows for the pros-

perity of Rome, he knelt before the throne, and received from the senator a laurel crown, with the more precious declaration,—‘This is the reward of merit.’ The people shouted ‘Long life to the capitol and the poet!’ A sonnet in praise of Rome was accepted as the effusion of genius and gratitude; and after the whole procession had visited the Vatican, the profane wreath was suspended before the shrine of St. Peter. In the diploma which was presented to Petrarch, the title and prerogatives of poet-laureate are revived in the capitol, after the lapse of 1300 years; and he receives the perpetual privilege of wearing at his choice a crown of laurel, ivy, or myrtle, of assuming the poetic habit, and of teaching, disputing, interpreting, and composing, in all places whatsoever, and on all subjects of literature. The grant was ratified by the authority of the senate and people, and the character of citizen was the recompence of his affection for the Roman name.”

The appearance of Petrarch, when arrayed for his triumph in the capitol, is carefully delineated in the subjoined sketch, copied from an illuminated copy of his own works.

Petrarch's person, if we may trust to his biographers, "was so striking with beauties as to attract universal admiration." They represent him "with large and manly features, eyes full of fire, a blooming complexion, and a countenance that bespoke all the genius and fancy that shone forth in his works." Possibly Petrarch was not over-vain of his exterior endowments, though it does not appear that modesty had ever interfered with his self-appreciation. "Without being uncommonly handsome," says he, in the "Letter to Posterity," "my person had something agreeable in it in my youth. My complexion was a clear and lively brown; my eyes were animated; my hair had grown gray before twenty-five, and I consoled myself for a defect which I shared in common with many of the great men of antiquity—for Cæsar and Virgil were gray-headed in youth;

and I had a venerable air, which I was by no means very proud of."

After Petrarch had been crowned at Rome, his income increased with his reputation. King Robert of Naples then appointed him his chaplain, with the privilege of not attending at court. He returned to Vaucluse, and the holy see actually forced its patronage upon a writer whose celebrity and independence of character had rendered him truly formidable. He would never take holy orders, that he might not be in a condition to accept a bishopric, and refused the office of apostolical secretary under three popes. In a bull by which Clement VI. conferred on him an additional benefice, it is expressly declared "that neither Petrarch nor any of his friends had solicited it;" and the poet did not, therefore, consider that any obligation was imposed on him, by these liberalities, to restrain the vehemence of his pen. In his Latin eclogues he introduces the shades of the pastors of the church, reproaching each other with their crimes, and consoling themselves by prophesying those of their reigning successor. The holy see was considered by Petrarch as "the school of errors, the temple of heresy, the manufactory of treasons, and the hell of living men." The church was "an impudent prostitute, supported by the opulence of her fornicators." He calls Avignon "the drain of all vices, whence the smell rose to pollute even the throne of the Almighty;" and adds that Cecile de Commenge, Vicomtesse de Turenne, secretly bartered her charms to Clement VI. for the power of selling to the public his temporal favours and spiritual indulgences. Never did luxury and licentiousness prevail so publicly and so ostentatiously in the pontifical palace. Petrarch shuddered at it, and he describes it in a way to make his readers shudder. At the period of the subsequent reformation his invectives against the court of Avignon rendered Petrarch infamous amongst the French catholics: but, in a semi-civilized age, a great poet is radiant with divinity; and in the fourteenth century the executioner would not place his hand on a head which had been hallowed by the laurel. Innocent VI. believed that Petrarch was a magician, but he dared not bring him to the stake—and notwithstanding the poet called him "a suspicious and indolent bear, whose coarseness caused the luxury and the easiness of his predecessor to be forgiven," yet he endeavoured to soothe him by honours and attentions; whilst the cardinals of the greatest influence could not induce him to kiss his foot. To indulge in the necessity which he experienced of saying every thing he thought and felt, Petrarch availed himself of a celebrity which no author, during his life, ever enjoyed in an equal degree. Still he was unhappy even on that account: "This laurel," says he, "without adding any thing to my knowledge, has increased my own discontent and the envy of others."

Arquà was long the residence of Petrarch; indeed it was there he died. It is twelve miles from Padua, and about three miles on the right of the high road to Rovigo, in the bosom of the Euganean hills. After a walk of twenty minutes across a flat well-wooded meadow, you come to a little blue lake, clear, but fathomless, and to the foot of a succession of acclivities and hills, clothed with vineyards and orchards, rich with fir and pomegranate trees, and every sunny fruit shrub. From the banks of the lake the road winds into the hills, and the church of Arquà is soon seen between a cleft where two ridges slope towards

each other, and nearly inclose the village. The houses are scattered at intervals on the steep sides of these summits; and that of the poet is on the edge of a little knoll overlooking two descents, and commanding a view not only of the glowing gardens in the dales immediately beneath, but of the wide plains, above whose low woods of mulberry and willow thickened into a dark mass by festoons of vines, tall single cypresses, and the spires of towns, are seen in the distance, which stretches to the mouths of the Po and the shores of the Adriatic.

The climate of these volcanic hills is warmer, and the vintage begins a week sooner than in the plains of Padua. The principal front of his charming villa is given beneath.

Every footstep of Laura's lover has been anxiously traced and recorded. The house in which he lodged is shown in Venice. The inhabitants of Arezzo, in order to decide the ancient controversy between their city and the neighbouring Ancisa, where Petrarch was carried when seven months old, and remained until his seventh year, have designated by a long inscription the spot where their great fellow-citizen was born.

Petrarch at this period paid peculiar attention to the study of the Latin tongue; and the following beautiful passage from "The Africa," which originally appeared in Latin, will strongly remind our readers of the Mantuan poet Virgil. The passage describes the death of Mago:—

"The Carthaginian rose—and when he found  
The increasing anguish of his mortal wound,  
All hope forbid—with difficult, slow breath  
He thus address'd the coming hour of death—  
"Farewell to all my longings after fame!  
Cursed love of power, are such thine end and aim?  
Oh, blind to all that might have made thy bliss,  
And must ambition's frenzy come to this?  
From height to height aspiring still to rise,  
Man stands rejoicing on the precipice,  
Nor sees the innumerable storms that wait  
To level all the projects of the great.  
Oh, trembling pinnacle of power on earth!  
Deceitful hopes! and glory blazon'd forth  
With false, fictitious blandishments! Oh, life  
Of doubt and danger, and perpetual strife  
With death! And, *thou*! worse than this night of woe  
That comest to all, but ah! when none can know,  
Hour singled from all years! why must man bear  
A lot so sad? The tribes of earth and air  
No thoughts of future ill in life molest,  
And when they die, sleep on, and take their rest;  
But man in restless dreams spends all his years,  
And shortens life with death's encroaching fears.  
Oh, *thou*, whose cold hand tears the veil from error,  
Whose hollow eye is our delusion's mirror!  
Death, life's chief blessing! At this hour of fate,  
Wretch that I am! I see my faults too late.  
Perils ill-sought, and crimes ill worth the price,  
Pass on in dire review before my eyes;  
Yet, thing of dust, and on the verge of night,  
Man dares to climb the stars, and on the height

Of heaven his owl vision dares to bend  
From that low earth, where all his hopes descend.  
What then avails me in this trying hour,  
Or thee, my Italy, this arm of power?  
Why did I bid the torch of ravage flame?  
Ah! why as with a trumpet's tongue proclaim  
The rights of man? confounding wrong and right,  
And plunging nations in a deeper night?  
Why did I raise of marble to the skies  
A gorgeous palace? Vain and empty prize!  
When with it lost my air-built dreams must lie  
Gulph'd in the Ocean of eternity.  
My dearest brother, ah! remember me,  
And let my fate avert the like from thee."  
"He said, and now, its mortal bondage riven,  
His spirit fled, and from its higher heaven  
Of space look'd down where Rome and Carthage lay,  
Thrice blest in having died before the day  
Whose wing of havoc swept his race away,  
And had not saved by valour vainly shown  
His country's woes, his brother's, and his own."

Petrarch's love of literary fame, and his ill-concealed jealousy of criticism, is strongly exhibited in the following letter to a distinguished dignitary of the church, who had long been his patron:—

"Reverend and most dignified prelate, James Colonna, my very honoured lord,—It is delightful to me to receive such an undoubted proof of your affectionate regard for me, as appears from the displeasure you feel in hearing my compositions criticised by some poor wretched ignorant creature; for you would not take so warm an interest in what concerns my honour if you did not love me sincerely. Know then, for your comfort, that I feel no more disturbed with the shrill tones of those chirping crickets than the moon does at the loud baying of a furious wide-mouthed mastiff. If I really had any intention to imitate the first verse of the Provençal poet, Arnaldo Daniello,

*Drez et raison es que je cante de Amour,*"

it was only to imitate it in part, because an imitation of the whole did not suit my purpose; and for that very reason I made use of his own proper words; but only so far as was necessary for my purpose. If these poor wretches could conceive the difference between an imitation and an absolute plagiarism, they would not hold such idle and extravagant language as they now do. But my comfort is in the words of Cicero, 'Vera laus fit à laudato viro.' Conceive, therefore, my dear and excellent friend, if these idle chatterings can give me uneasiness for a single moment. It is a matter of real concern to me to learn from your letter that our worthy and admirable friend Messer Bernardo is tormented with his old complaint. So excellent a man ought not, if such were the will of heaven, to suffer any grievance whatever. Remember me kindly to him, and assure him of the pain I feel on his account. I beg you also to make an apology on my part to the reverend cardinal John, your brother, for not having endeavoured to find the book he pointed out to me. The reason for the omission was this: in the very short time I passed with the most serene king Robert, I was never for a single moment my own master; and when I proposed returning to Rome, I had not sufficient time left to take leave of any of my friends. Be so good, in my name, most respectfully to salute your excellent and honoured father, Messer Stephen Colonna, and continue as usual to exhilarate your old friend Francis with your delightful letters. Farewell.

"From inclination as well as duty,

"Your most devoted friend,

"FRANCIS PETRARCHA."

"Naples, 8th Calends of April, 1341."

In 1343 Petrarch was for some time a resident at Naples, and while there witnessed a storm, which he describes as the most fearful and interesting visitation of Providence he ever beheld. He says that "it was indeed one general commotion of the Mediterranean and Adriatic; but I will call it the Neapolitan tempest, because it found me, against my will, in the port of Naples; and, since the eagerness of the courier to depart leaves me not time enough to record it fully, I beg you will be assured that no man ever beheld the elements of earth and water in more fearful conspiracy. This visitation from heaven was foretold several days before its occurrence, by the bishop of a little neighbouring island, who rested his prediction on certain astronomical calculations; but, as it rarely happens that prophets penetrate the whole truth of any future event, so he unluckily announced as the completion of the catastrophe, 'that a terrible earthquake would ensue, by which Naples itself would be destroyed on the 25th of November.' This advertisement obtained so much credit that the greater part of the inhabitants actually gave up every other consideration to the grand concerns of religion, imploring the mercy of God, and his forgiveness of their past offences, as if the following day were infallibly to be their last. On the other hand, many laughed at the idle prediction, observing how little faith was due to astrologers, the more especially as only a few days had passed since the last earthquake. In the midst of these apprehensions and encouragements (of which the former however predominated) I retired, on the evening of the 24th, just before sunset, to my apartment, and in my way thither met almost all the females of the city (in whom the sense of shame had been swallowed up by that of danger) bare-footed and with hair dishevelled, crowding to the churches, with their babes in their arms, crying and imploring God for mercy. As night came on, the sky was more than usually serene. My servants went to bed immediately after supper. For my own part, I proposed to stay up and watch the setting of the moon, at that time (I think) in her first quarter. The window which looks to the west was left open, and I saw her as about midnight she hid herself behind St. Martin's mount, her face much darkened, and partially covered by clouds. I then closed the window, and stretched myself on my bed, where, after lying for some time awake, I was just falling asleep when I was roused by the noise of an earthquake. The casement was burst open, the light which I always keep burning in my chamber was extinguished, and the whole house shook to its very foundations. In this state, between sleeping and waking, and assailed by the terror of impending destruction, I ran to the cloisters of the monastery in which I reside, and where we groped about in the dark (having only the glimmering of one dull lamp to direct us) to receive and administer whatever consolation was in our power. Here we were shortly met by the abbot—a very pious man—with his monks in procession, who, terrified by the tempest, were bearing the holy cross and reliques of saints, and preceded by lighted torches, with devout prayers and exclamations, in their way to the church to sing matins to the Virgin. This having inspired me with courage, I accompanied them to the church, where we all with one accord threw ourselves prostrate on the ground, and did nothing else but with loud uplifted voices implore the divine mercy and forgiveness, expecting

every minute the sacred building to fall and bury us in its ruins.

"It would be much too long to recount all the horrors of that infernal night; and although the truth very far exceeds all power of description, yet I fear to be thought guilty of exaggeration when I exclaim, What deluges of water! what wind! what thunder! what terrible rumbling in the heavens! what fearful tremblings of the earth! what vehement commotion in the sea! what shrieks of amazed and distracted multitudes! The long night seemed extended by magic art to twice its actual duration; and when morning came, its approach was announced to us rather by the clock than by any corresponding light in the firmament. The priests robed themselves for the celebration of mass, while we, not having courage to lift our faces to heaven, remained stretched on the ground in prayer and supplication. Though day had broke, it was still as dark as night. The multitudes in the upper part of the city had begun to disperse; but towards the sea-shore the noise seemed to increase, and the clattering of horses was heard in the street below. What this could mean it was impossible to ascertain; but, madebold by despair, I at last mounted on horseback myself, resolved to see, even though I should perish.

"Great God! who ever heard of such things as I then beheld? The oldest seamen declared that the like was never before witnessed. In the midst of the port were seen an infinite number of poor wretches scattered about on the sea, and struggling to gain the shore, who, by the violence and fury of the waves, were battered about till they looked like so many eggs dashed to pieces on the beach. The whole space was filled with drowned and half-drowned bodies—some with their skulls fractured—others with broken arms or legs—others with their bowels gushing out: and the screams of men and women who lived near the beach were no less terrific than the uproar of the elements. The very sands, on which, the day before, you walked in ease and safety, were become more dangerous than the fero of Messina or the whirlpool of Charybdis. A thousand or more of the Neapolitan nobility came to the shore on horseback, as if to solemnize the funeral obsequies of their country; and when I found myself among them I began to be of better cheer, seeing that, if I were doomed to perish, I should die with the honour of knighthood. Soon the dreadful rumour came to our ears that the ground on which we trod had been undermined by the sea and was beginning to open. We fled precipitately, and saved ourselves; but the spectacle we then beheld was the most terrible ever witnessed by mortal eye—the heavens so commingled! the sea so implacably turbulent! the waves mountain-high—and in colour neither black nor blue, as in more ordinary tempests, but perfectly white, like hills of snow, rolling over the whole expanse from Capri to Naples.

"The young queen, bare-footed, and attended by a numerous train of females, went to visit the churches dedicated to the blessed Virgin. No vessel in the harbour was capable of resisting the violence of the gale; and three galleys which had arrived from Cyprus, and were to depart that morning, were seen by sympathizing thousands to go down without a soul being saved. Three other large ships, which had anchored in the port, struck against each other, and sunk, and all on board perished. Of all the vessels

one only escaped, on board of which were no less than 400 galley-slaves who had been engaged in the Sicilian war; by the strength of these malefactors alone the ship being enabled to stem the fury of the overwhelming element; and even they were quite exhausted, when, at the approach of night, beyond all hope, and contrary to the universal expectation, the sky cleared, the wind abated, and the sea grew calm. Thus the most infamous of the sufferers are those alone who escaped a watery grave. Alas! that the words of Lucan should have thus proved true—"that fortune favours the wicked,"—or that such is the pleasure of God—or that they, who in the hour of trial are most indifferent whether they live or die, are the securest from danger! This is the history of yesterday."

Franc. Petrarca

Through the whole of his life Petrarch cherished the habits of strict temperance, to which he had been accustomed from his very infancy: he seldom ate more than one meal a day; he disliked wine, lived chiefly upon vegetables, and often during the seasons of devotion and on fasting-days, bread and water constituted the whole of his dinner. As his fortune increased, he augmented the number of his servants and transcribers; these he always took with him on his journeys, and kept more horses to carry his books. Twelve years before his death he gave his rich collection of ancient manuscripts to the Venetian senate, and thus became the founder of the library of Saint Marc. He requested, and received by way of remuneration, a mansion in Venice. Possessing a house in almost every country where he had an ecclesiastical benefice, Petrarch lived as if he had no home, and was ever regretting his hermitage of Vacluse. He had resided there, with few interruptions, ten years during Laura's life-time, and he often returned there after her death. In speaking of this abode he says,— "I had resolved to return here no more, but my desire overcame my resolution; and, in justification of my inconstancy, I have nothing to allege but the necessity which I feel for solitude. In my own country I am too well known, too much courted, too greatly praised. I am sick of adulation; and that place becomes dear to me, where I can live to myself alone, abstracted from the crowd, and unannoyed by the trumpet of Fame. Habit, which is second nature, has rendered Vacluse my true country." The last time he resided at it two years, and he says,— "I am again in France, not to see what I have already seen a thousand times, but to dissipate weariness and disquietude, as invalids seek to do, by change of place. Thus I have no place to remain in, none to go to: I am weary of life; and whatever path I take, I find it strewn with flints and thorns. In good truth the spot which I seek has no existence upon earth: would that the time were come when I might depart in search of a world far different from this wherein I feel so unhappy—unhappy, perhaps, from my own fault; perhaps from that of mankind; or it may be only the fault of the age in which I am destined to live; or it may be the fault of no one—still I am unhappy."

Wherever he went, he converted his abode into a

sort of hermitage, and continued to compose whole volumes, still exclaiming that he was only losing his time, but that he must do something to forget himself.—"Whether I am being shaved or having my hair cut, whether I am riding on horseback or taking my meals, I either read myself, or get some one to read to me. On the table where I dine, and by the side of my bed, I have all the materials for writing; and when I awake in the dark I write, although I am unable to read the next morning what I have written." During the latter years of his life he always slept with a lighted lamp near him, and rose exactly at midnight. "Like a wearied traveller I quicken my pace in proportion as I approach the end of my journey. I read and write night and day: it is my only resource. My eyes are heavy with watching, my hand is wearied with writing, and my heart is worn with care. I desire to be known to posterity; if I cannot succeed, I may be known to my own age, or at least to my friends. It would have satisfied me to have known myself; but in that I shall never succeed." What does a life, thus spent, avail? To what purpose are so many watchful nights and weary days,—so many specimens of a noble genius, and of a benevolent heart? In the letter which Petrarch addressed, a few months before his death, to posterity as his last legacy, and as the ultimate result of his long studies, he declares that he never found a philosophical system which was satisfactory to him; and scarcely an historical fact, on the truth of which he could depend; and thus concludes—"To philosophise is to love wisdom; and true wisdom is Jesus Christ."

The lessons of early adversity, which harden selfish dispositions, had taught the generous heart of Petrarch to feel for the sufferings of others; and shunning—like all men, who are merely busied with their own feelings and intellectual faculties—"the exertion necessary for the acquirement and preservation of riches," he was led in the fearlessness of youth to spend for the benefit of others nearly all of the scanty inheritance he derived from parents who died in exile. He bestowed one part as a dowry on his sister, who married at Florence, and gave up the other to two deserving friends, who were in indigent circumstances. He lent even some classic manuscripts, which he called his only treasures, to his old master, that he might pledge them; in this manner Cicero's books, "*De Gloria*," were irrecoverably lost. If his presents were declined, he attached some verses to them which compelled his friends to accept them; and he distributed his Italian poetry as alms amongst rhymesters and ballad-singers. As he advanced in years, the "sovereign contempt for riches," which he continued to profess, was more apparent than real, especially towards the end of his career, yet he never forgot those who looked to him for aid, which he always bestowed with kindness. Among the many legacies of his last testament he left to one of his friends his lute, that he might sing the praises of the Almighty—to a domestic a sum of money, intreating him not to lose it at play as usual—to his amanuensis, a silver goblet, recommending him to fill it with water in preference to wine—and to Boccaccio a winter pelisse, for his nocturnal studies. Nor did he wait till death had compelled him to be liberal. "In good truth," he writes to Boccaccio, "I know not what you mean by answering that you are my debtor in money. Oh! if I were able to enrich you!—but for two friends like

ourselves, who possess but one soul, one house is sufficient."

Petrarch's philanthropy frequently exhibited itself in the most democratic way. He speaks in the same terms of the peasant and his wife who waited on him at Vacluse, as he uses when recording the good qualities of his powerful friends:—"He was my counsellor, and the keeper of all my most secret designs; and I should have lamented his loss still more grievously had I not been warned by his advanced age that I could not expect long to retain possession of such a companion. In him I have lost a confidential servant, or, rather, a father, in whose bosom I had deposited my sorrows for these fifteen years past; and his humble cottage was to me as a temple. He cultivated for me a few acres of indifferent land. He knew not how to read, yet he was also the guardian of my library. With anxious eye he watched over my most rare and ancient copies, which, by long use, he could distinguish from those that were more modern, or of which I myself was the author. Whenever I consigned a volume to his custody, he was transported with joy; he pressed it to his bosom with sighs; with great reverence he repeated the author's name; and seemed as if he had received an accession of learning and happiness from the sight and touch of a book. His wife's face was scorched by the sun, and her body attenuated by labour; but she had a soul of the most candid and generous nature. Under the burning heat of the dog-star, in the midst of snow and of rain, she was found from morning till evening in the fields, whilst even a greater part of the night was given to work than repose. Her bed was of straw; her food was black bread, frequently full of sand; and her drink was water, mixed with vinegar; yet she never appeared weary or afflicted; never showed any desire of a more easy life; nor was even heard to complain of the cruelty of destiny and of mankind."

Petrarch spent the last four years of his life at the beautiful mountain village of Arquà, about twelve miles from Padua; and here he died suddenly, in all probability of apoplexy, on the 19th of July, 1374, having just completed his seventieth year. He was found that morning in his library, with his head resting on a book.

The important object of Petrarch's study and ambition during his life was to dissipate the darkness which, during the middle ages, had enveloped the literature of the ancients. But what genius and ardour could have been equal to the magnitude of this undertaking? He has so far succeeded, however, in clearing the road to the study of antiquity as to acquire the title, which he still justly retains, of the restorer of classical learning. "Are you not ashamed," wrote he to the Romans, "that the wrecks of your ancient grandeur, spared by the inundation of the barbarians, are daily sold by your miscalculating avarice to foreigners? And that Rome is no where less known and less loved than in Rome?" Nor did the enthusiasm of Petrarch for ancient monuments prevent him from describing them with the taste of a critic. He set the first example of collecting medals as the best guides through the labyrinth of chronologies and genealogies of dynasties which had disappeared from the world. We still reap the benefit of those manuscripts which he indefatigably sought after in every corner of Europe, and multiplied without sparing money when he was poor, or labour

when he was old and infirm; and such was his anxiety for their correctness that he often submitted to the drudgery of a transcriber. He found the Latin language,

"Not verdant then  
With foliage, but of dusky hue: not light  
The boughs and tapering, but with knares deform'd  
And matted thick: fruits there were none, but thorns."

Yet under his toils it revived with a freshness which made him to be looked upon as having brought back the Augustan age—a merit, however, which the united and incessant exertions of six generations of learned men, from his time to those of Leo X., have scarcely attained. Those whose claim to the title of accomplished scholars rest on elegancies painfully gleaned from the classics, are not justified in sneering at the latinity of Petrarch. It seems that in modelling his style upon the Romans, he was unwilling to neglect entirely the fathers of the church, whose phraseology was more appropriate to his subjects; and the public affairs being at that period transacted in Latin, he could not always reject many of those expressions which, although originating from barbarous ages, had been sanctioned by the adoption of all the universities, and were the more intelligible to his readers. In sacrificing purity he gained freedom, fluency, and warmth; and his prose, though not a model for imitation, is beyond the reach of imitators, because it is original and his own.

In Latin poetry Petrarch could not be successful while its natural beauties were so slightly felt, that he himself, in his youth, was guilty of writing hexameters in rhyme. The pronunciation, from which all the metrical systems of the ancients sprang, had already experienced so great a change that he was often obliged to guess, and not always happily, at the quantity of syllables. Had he possessed the highest poetical powers which nature ever granted to a mortal, he could not have been, in a dead language, a more than ordinary poet. The magical combination of harmony, splendour, freshness, energy, spirit, pathos, and grace in describing every object of creation, however insignificant—every obscure and fleeting idea, and all the commonest feelings of the heart, is effected only by words; but it can never be effected unless the poet masters his diction so absolutely as to re-cast it into a language of his own creation; and this is, perhaps, the grand advantage by which the early poets have outstripped all their successors. But the more the laws of a language become unalterable, the more is genius cramped by fetters; and if voluntarily chosen, it deserves no sympathy. Petrarch, however, submitted to them as the only means of commanding the admiration of Europe; and he obtained it.

"The Vision of the Spirit of Laura" was written, as appears by expressions at the close of it, when Petrarch was far advanced in years. He revised it four months before his death, and inserted it as an episode in a moral poem which he called "The Trionfi," a series of allegorical visions on the power of love, chastity, death, talents, fame, time, and eternity. Several Provençal poems written before his time, and "The Dream," "The Flower and the Leaf," and "The House of Fame," of his contemporary Chaucer, are of the same description. Perhaps the models of them may be traced in the vision which the monks preached in imitation of those of

Ezekiel and St. John's Revelation. The last canto of "The Trionfi" is called "Della Divinità," and begins, "Since, then, I behold nothing certain beneath the heavens, I look fearfully around me, and ask myself, in what then canst thou trust? I answered, in God!" He considered this work as a great undertaking; and he gave it up from the fear that he would be unable to finish it. He recommenced it again, however, but perceived he had failed; he persevered, nevertheless, and left it so disfigured with various readings, that, to complete a copy after his death, it was necessary to supply much by conjecture. It is only when he is speaking of Laura in his poem that his heart communicates its fire to his genius, which had languished more under the disgust of life than the burthen of years. He records his melancholy feelings on the margins of his manuscripts:—"The more I reflect on what I am, the more I feel ashamed of this work: it is no longer myself, it is another who writes." He was born to create with anxiety, and to dissipate in despair, the illusions which were necessary to his repose, and he was thus often tempted to destroy even the lyric poetry which he had addressed to Laura. He does not even mention it in his "Letter to Posterity," though, if it had not been for this very poetry, the other literary merits of this great man would not have been remembered with so much admiration. To his intimate friends he expressed himself ashamed of having devoted his talents to the amusement of ballad-singers and lovers, lamenting that his verses had been too generally dispersed to be recalled, and complaining that they had sometimes been partially disfigured, and sometimes entirely forged by professional singers, who took great merit to themselves for collecting them. He offers the same apology to the world, in the first sonnet of his collection, which he resolved to prepare in his old age, rejecting those pieces which were apocryphal, and those which he considered unworthy of him. If many of Petrarch's manuscripts did not still exist, it would be impossible to imagine or believe the unwearied pains he has bestowed on the correction of his verses. They are curious monuments, although they afford little aid in exploring by what secret working the long and laborious meditations of Petrarch has spread over his poetry all the natural charms of sudden and irresistible inspiration. The following is a literal translation of a succession of memorandums in Latin at the head of one of his sonnets:—"I began this by the impulse of the Lord (Domino jubente), 10th September, at the dawn of day, after my morning prayers.—I must make these two verses over again, singing them (cantando), and I must transpose them; three o'clock, A. M., 19th October.—I like this (hoc placet), 30th October, ten o'clock in the morning.—No; this does not please me. 20th December in the evening." And in the midst of his corrections he writes, on laying down his pen, "I shall return to this again; I am called to supper.—February 18th, towards noon; this is now well; however, look at it again (vide tamen adhuc)."

Sometimes he notes the town where he happens to be—"1364, *Veneris mane, 19 Jan. dum invitatus Patavii ferior.*"—It might seem rather a curious than useful remark that it was generally on Friday that he occupied himself with the painful labour of correction, did we not also know that it was to him a day of fast and penitence. When any thought oc-

curred to him, he noted it in the midst of his verses thus: "Consider this—I had some thoughts of transposing these lines, and of making the first verse the last, but I have not done so for the sake of harmony—the first would then be more sonorous, and the last less so, which is against rule; for the end should be more harmonious than the beginning." Sometimes he says, "The commencement is good, but it is not pathetic enough." In some places he suggests to himself to repeat the same words rather than the same ideas. In others he judges it better not to multiply the ideas, but to amplify them with other expressions. Every verse is turned in several different ways; above each phrase and each word he frequently places equivalent expressions in order to examine them again; and it requires a profound knowledge of Italian to perceive that, after such perplexing scruples, he always adopts those words which combine at once most harmony, elegance, and energy.

The best translations from Petrarch's Italian poetry are from the pen of Lady Dacre, from whom we take the subjoined specimens, merely observing that the opening sonnet was written late in life, and that the canzone appeared somewhat earlier:—

"Life flies with rapid course that nought may stay,  
Death follows after with gigantic stride;  
His past and present on my spirit prey,  
And future evils threat on every side;  
Whether I backward look or forward fare,  
A thousand ills my bosom's peace molest;  
And were it not that pity bids me spare  
My nobler part, I from these thoughts would rest.  
If ever aught of sweet my heart has known,  
Remembrance wakes its charms, while, tempest tost,  
I mark the clouds that o'er my course still frown;  
E'en in the port I see the storm afar;  
Weary my pilot, mast and cable lost,  
And set for ever my fair polar star."

## CANZONE.

"On! my own Italy! though words are vain  
The mortal wounds to close,  
Unnumber'd, that thy beauteous bosom stain,  
Yet may it soothe my pain  
To sigh forth Tyber's woes,  
And Arno's wrongs, as on Po's sadden'd shore  
Borrowing I wander, and my numbers pour.  
Ruler of Heaven! By the all-pitying love  
That could thy Godhead move  
To dwell a lowly sojourner on earth,  
Turn, Lord! on this thy chosen land thine eye:  
See, God of Charity!  
From what light cause this cruel war has birth;  
And the hard hearts by savage discord steel'd,  
Thou, Father! from on high,  
Touch by my humble voice, that stubborn wrath may yield!"

"Ye, to whose sov'reign hands the fates confide  
Of this fair land the reins,—  
(This land for which no pity wrings your breast)—  
Why does the stranger's sword her plains infest?  
That her green fields be dyed,  
Hope ye, with blood from the barbarians' veins?  
Beguiled by error weak,  
Ye see not, though to pierce so deep ye boast,  
Who love, or faith, in venal bosoms seek:  
When throng'd your standards most,  
Ye are encompass'd most by hostile bands.  
O hideous deluge gather'd in strange lands,  
That rushes down again  
O'erwhelms our every native lovely plain!  
Alas! if our own hands  
Have thus our weal betrayed, who shall our cause sustain?"

"Well did kind Nature, guardian of our state,  
Rear her rude Alpine heights,  
A lofty rampart against German hate;  
But blind ambition, seeking his own ill,  
With ever restless will,  
To the pure gales contagion foul invites:  
Within the same strait fold  
The gentle flocks and wolves relentless throng,  
Where still meek innocence must suffer wrong:  
And these,—Oh, shame avow'd!—  
Are of the lawless hordes no tie can hold:"

Fame tells how Marius' sword  
Erewhile their bosoms gored,—  
Nor has Time's hand aught blurr'd the record proud !  
When they who, thirsting, stoop'd to quaff the flood,  
With the cool waters mix'd, drank of a comrade's blood !

"Great Caesar's name I pass, who o'er our plains  
Pour'd forth the ensanguined tide,  
Drawn by our own good swords from out their veins ;  
But now—nor know I what ill stars preside,—  
Heaven holds this land in hate !  
To you the thanks !—whose hands control her helm !—  
You, whose rash feuds despoil  
Of all the beautiful earth the fairest realm !  
Are ye impell'd by judgment, crime, or fate,  
To oppress the desolate ?  
From broken fortunes, and from humble toil,  
The hard-earn'd dole to wring,  
While from afar ye bring  
Dealers in blood, bartering their souls for hire ?  
In truth's great cause I sing,  
Nor hatred nor disdain my earnest lay inspire.

"Nor mark ye yet, confirm'd by proof on proof,  
Bavaria's perfidy,  
Who strikes in mockery, keeping death aloof ?  
(Shame, worse than aught of loss in honour's eye !)  
While ye, with honest rage, devoted pour  
Your inmost bosom's gore !—  
Yet give one hour to thought,  
And ye shall own, how little he can hold  
Another's glory dear, who sets his own at nought.  
Oh ! Latin blood of old !  
Arise, and wrest from obloquy thy fame,  
Nor bow before a name  
Of hollow sound, whose power no laws enforce !  
For if barbarians rude  
Have higher minds subdued,  
Ours ! ours the crime !—not such wise Nature's course.

"Ah ! is not this the soil my foot first press'd ?  
And here, in cradled rest,  
Was I not softly hush'd !—here fondly rear'd ?  
• Ah ! is not this my Country ?—so endeared  
By every filial tie !  
In whose lap shrouded both my parents lie !  
Oh ! by this tender thought,  
Your torpid bosoms to compassion wrought,  
Look on the people's grief !  
Who, after God, of you expect relief ;  
And if ye but relent,  
Virtue shall rouse her in embattled might,  
Against blind fury bent,  
Nor long shall doubtful hang the unequal fight ;  
• For no,—the ancient flame  
Is not extinguish'd yet, that raised th' Italian name !

"Mark, sov'reign lords ! how Time, with pinion strong,  
Swift hurries life along !  
E'en now, behold ! Death presses on the rear.  
We sojourn here a day—the next, are gone !  
The soul disrobed—alone,  
Must shuddering seek the doubtful pass we fear.  
Oh ! at the dreaded bourne,  
Abase the lofty brow of wrath and scorn,  
(Storms adverse to the eternal calm on high !)  
And ye, whose cruelty  
Has sought another's harm, by fairer deed  
Of heart, or hand, or intellect, aspire  
To win the honest meed  
Of just renown—the noble mind's desire !  
Thus sweet on earth the stay !  
Thus to the spirit pure, unbarr'd is Heaven's way !

"My song ! with courtesy, and numbers sooth,  
Thy daring reasons grace,  
For thou, the mighty, in their pride of place,  
Must woo to gentle ruth,  
Whose haughty will long evil customs nurse,  
Ever to truth adverse !  
Thee better fortunes wait,  
Among the virtuous few—the truly great !  
Tell them—but who shall bid my terrors cease ?  
Peace ! Peace ! on thee I call ! return, oh ! Heav'n-born Peace !"

Having thus taken a general view of Petrarch's literary remains, we must now briefly advert to those of a more perishable character. We have seen that he died at Arquà, and in that charming spot was his body interred. Petrarch is laid (for he cannot be said to be buried) in a sarcophagus of red marble, raised on foursquare columns on an elevated base, and preserved from an association with meaner tombs. It stands

conspicuously alone, and is accurately delineated beneath.

Petrarch's fountain (for here every thing is Petrarch's) springs and expands itself beneath an artificial arch, a little below the church, and abounds plentifully, in the driest season, with that soft water which was the ancient wealth of the Euganean Hills. The revolutions of centuries have spared these sequestered valleys, and the only violence which has been offered to the ashes of Petrarch was prompted, not by hate, but veneration. An attempt was made to rob the sarcophagus of its treasure, and one of the arms was stolen by a Florentine through a rent which is still visible.

All who visit Arquà, and feel any interest in literature, make a pilgrimage to the tomb of Petrarch, and amongst this number we must place Byron, who wrote the following beautiful lines on his last earthly resting place :—

"There is a tomb in Arquà;—rear'd in air,  
Pillared in their sarcophagus, repose  
The bones of Laura's lover : here repair  
Many familiar with his well-sung woes ;  
The pilgrims of his genius. He arose  
To raise a language, and his land reclaim  
From the dull yoke of her barbaric foes :  
Watering the tree which bears his lady's name  
With his melodious tears, he gave himself to fame.

"They keep his dust in Arquà, where he died ;  
The mountain-village, where his latter days  
Went down the vale of years ; and 'tis their pride—  
An honest pride—and let it be their praise,  
To offer to the passing stranger's gaze  
His mansion and his sepulchre ; both plain  
And venerably simple, such as raise  
A feeling more accordant with his strain  
Than if a pyramid formed his monumental fame.

"And the soft quiet hamlet where he dwelt  
Is one of that complexion which seems made  
For those who their mortality have felt,  
And sought a refuge from their hopes decayed  
In the deep umbrage of a green hill's shade,  
Which shows a distant prospect far away  
Of busy cities, now in vain displayed,  
For they can lure no further ; and the ray  
Of a bright sun can make sufficient holiday."

A tablet has also been raised to Petrarch at Parma, in the chapel of St. Agatha, at the cathedral, because he was archdeacon of that society, and was only snatched from his intended sepulture in their church by a foreign death. Another tablet with a bust has been erected to him at Pavia, on account of his having passed the autumn of 1368 in that city.

It may be proper to add, that the political condition of Italy, which has for ages precluded the natives of that beautiful country from imitating the example of such men as Petrarch, has also induced them to pay a species of idolatrous attention to the remains of the illustrious dead. Petrarch was indeed a sincere

Christian, without intolerance—a sound patriot without austerity; who neither wasted his feelings in the idle generalities of philosophy, nor restricted them to the narrow limits of a party or faction;—he was just, generous, affectionate, and gentle. All his sonnets together do not shed a lustre on him equal to the sincere, single-hearted, mild, yet uncompromising spirit that breathes throughout the letters of advice and remonstrance, which not idly or obtrusively, but under the sanction and authority of his great name, and the affectionate regard professed for him, he addressed to all whom he believed influential either for good or ill; from popes and emperors to Colo Rienzi, the well meaning tribune of Rome. Like our own great Bacon, Petrarch lived centuries in advance of those around him.

**PETRONIUS, TITUS**, surnamed *Arbiter*, a Roman author, notorious for his licentiousness and obscenity. He was born at Marseilles and lived in the court of Nero, being for a time the favourite of the emperor, who made him master of his voluptuous banquets and revelries. But he finally fell a victim to the suspicions of the tyrant, by whose command he was obliged to put himself to death. The corruption and dissoluteness of Roman manners at that period are portrayed in the fragments of the "*Satyricon Libri*," in which Petronius describes, in prose and in verse, the profligacy of the times, and which are, therefore, valuable at least as a picture of manners. Some attribute it, on account of several allusions to another author who lived for some time in the reign of Commodus, in Naples.

**PETT, SAMUEL**, a medical practitioner, who was born in Cornwall in 1765, and received the rudiments of his education at the grammar school of his native town. In 1781, when he was in his sixteenth year, he entered the dissenting academy at Daventry. Dr. Pett's first settlement in his professional character was at Plymouth. He removed in 1796 and took up his abode at Clapton. To improvements in the condition of his fellow-creatures he was eagerly devoted, especially such as came within the scope of his profession. Having thoroughly studied, from the commencement, the operation of Dr. Jenner's discovery, he was a zealous advocate for vaccination, which he believed would finally exterminate the small-pox, or at least destroy the malignity of the disease. He therefore discouraged the variolous inoculation, and partly as a trustee of the parish of Hackney, and partly as a physician, he procured the disuse of the practice amongst the parochial dependents. He drew up a paper on the comparative advantages of the two inoculations to which he gained the signatures of the medical practitioners at Hackney, and this determined the resolution of the guardians of the poor. Dr. Pett died at his residence in Clapton Square, on the 1st of January, 1823, in the fifty-seventh year of his age. His death was the consequence of a slight wound in the hand, which he received while engaged in dissection.

**PETTY, SIR WILLIAM**, a celebrated practical philosopher, who was born on the 16th of May, 1623. Having received the rudiments of his education at a grammar school at Romsey in Hampshire, he was sent to the university of Caen in Normandy, where he remained about two years. He then came back to England and entered the navy, where he saved a sufficient sum of money to enable him to visit several foreign schools of medicine. In 1647 a patent was granted him by parliament for seventeen years

for a machine, which he calls an instrument for double writing. In an advertisement prefixed to his "*Advice to Mr. Samuel Hartlib*," he calls it, "an instrument of small bulk and price, easily made, and very durable; whereby any man, even at the first sight and handling, may write two resembling copies of the same thing at once, as serviceably and as fast (allowing two lines upon each page for setting the instruments) as by the ordinary way, of what nature, or in what character, or what matter soever, as paper, parchment, a book, &c., the said writing ought to be made upon." Though this invention did not prove very profitable, yet it introduced him to several persons of distinction. He subsequently took up his residence at Oxford, where he practised as a physician, and so high did he rank as a man of science that at his house were held the philosophical meetings which preceded and gave rise to the royal society. In 1652 he was appointed physician to the army in Ireland, and he was physician to three lord lieutenants successively. Some time after his settlement in Ireland, having observed that the lands forfeited by the rebellion in 1641, which had been adjudged to the soldiers who suppressed it, were insufficiently measured, he represented the matter to the proper authorities, who granted him a contract to make the admeasurements anew; and these he finished with such exactness that there was no estate of 60*l.* per annum and upwards which was not distinctly marked at its true value, maps being likewise made by him of the whole. By this contract he gained a very considerable sum of money. Besides twenty shillings a day, which he received during the performance, he had also a penny an acre by agreement with the soldiers: and it appears from an order of government, dated at the castle of Dublin, 19th of March, 1655, that he had then surveyed 2,008,000 acres of forfeited profitable land. He was likewise one of the commissioners for setting out the lands to the army after they were surveyed. When Henry Cromwell obtained the lieutenancy of that kingdom in 1655, he made Dr. Petty his secretary, appointed him a clerk of the council there in 1657, and had him elected a burgess for West Looe in Cornwall, in Richard Cromwell's parliament, which met in 1658. Shortly after, however, Sir Hierom Sankey, member for Woodstock, impeached him for high crimes and misdemeanors in the execution of his office. He came to England and appeared in the house of commons, where he answered to the charge of his prosecutors; the matter was adjourned but never came to an issue as the parliament was suddenly dissolved the following day. Henry Cromwell had written a letter to Thurloe, in which he speaks very favourably of him. He says, "Sir, I have heretofore told you my thoughts of Dr. Petty, and am still of the same opinion; and if Sir Hierom Sankey do not run him down with numbers and noise of adventurers, and such other like concerned persons, I believe the parliament will find him as I have represented. He has curiously deceived me these four years if he be a knave. I am sure the juntos of them, who are most busy, are not men of the quietest temper. I do not expect you will have leisure or see cause to appear much for him; wherefore this is only to let you understand my present thoughts of him. The activeness of Robert Reynolds and others in this business shows that Petty is not the only mark aimed at."

Upon his return to Ireland soon after, some further endeavours being used to bring on a prosecution, Petty published the same year, "A Brief View of the Proceedings between Sir Hierom Sankey and the Author, with the State of the Controversy between them," in three sheets, which was followed by "Reflections upon some Person and Things in Ireland," &c. He then came again to England, and brought a very warm application in his favour from the lord lieutenant in these terms: "Sir, the bearer, Dr. Petty, hath been my secretary, and clerk of the council here in Ireland, and is one whom I have known to be an honest and ingenious man. He is like to fall into some trouble from some who envy him. I desire you to be acquainted with him, and to assist him wherein he shall reasonably desire it. Great endeavours have been used to beget prejudice against him, but when you speak with him he will appear otherwise." Notwithstanding this, he was removed from his public employments in June.

Dr. Petty then retired to Ireland, where he remained till the restoration, when he obtained the post of commissioner of the court of claims. He was one of the first fellows of the royal society, and was also a member of its council. To this learned body he presented a model of a double-bottomed ship to sail against wind and tide. In 1665 he communicated "A Discourse about the Building of Ships," containing some curious information on that subject, when he was knighted by the king. Sir William's ship performed one voyage from Dublin to Holyhead, into which narrow harbour she turned in against wind and tide, but after that was lost in a violent storm.

In 1666 Sir William drew up his treatise called "Verbum Sapienti," containing an account of the wealth and expenses of England, and the method of raising taxes in the most equal manner. The same year (1666) he suffered a considerable loss by the fire of London, having purchased, several years before, the earl of Arundel's house and gardens, and erected buildings in the garden called Token House, which were almost destroyed by the conflagration. In 1667 he commenced a pilchard fishery, which, as well as some lead mines in which he afterwards engaged, turned out a good speculation. His death took place in 1687. He was buried at Romsey, and a stone was erected to his memory.

PETYT, WILLIAM, an English lawyer, who was for many years a keeper of the records in the Tower. He was the author of several works. Those entitled "The Ancient Rights of the Commons of England, proving that they were ever an essential part of the Parliament," his "Miscellanea Parliamentaria," and his "Jus Parliamentarium," are the principal. His death took place in 1707.

PHALARIS.—This prince, so notorious for his cruelty, was a native of Astypalea in Crete. On his banishment from that place he went to Sicily, where he made himself master of Agrigentum, about 571 B. C., and sought to maintain his power by cruelty and severity. The most remarkable instance of his cruelty was the punishment of the brazen bull prepared by Perillus of Athens. The victim was shut up in the body of the bull, and roasted slowly by a fire underneath. The screams of pain uttered by the unhappy man were made, by some machinery, to resemble the lowing of a bull. Phalaris caused the first experiment to be tried on the inventor. After a reign of about sixteen years, he was killed during a rebel-

lion. The letters which bear the name of Phalaris have been fully proved to be spurious by Bentley, in his celebrated controversy with Boyle.

PHERECYDES, a celebrated sage of ancient Greece. He is regarded as the first who wrote in prose on philosophy and religion, although his tone of expression, as is natural, inclines much to poetry. He was a native of the island of Syros, flourished in the sixth century B. C., and was a contemporary of Thales. The fragments of his work on nature and the gods are merely allegorical thoughts. Pherecydes considered Jupiter, time, and the earth, which he esteemed a chaos, as the elements of all things.

PHIDIAS, a celebrated Grecian statuary, who flourished about 450 years before the Christian æra. The circumstance which first elicited the talents of Phidias was the munificent administration of Pericles. The city of Athens having been in a great measure destroyed by the Persians, the opportunity was eagerly seized by that magnificent projector of adorning it with far more splendid edifices than those which had been overthrown by the violence of the invaders. Intent on this great national design, he saw with eagerness, in the genius of Phidias, the means of giving form, shape, and completeness to the most glorious of his conceptions. He accordingly appointed Phidias the general superintendent of all the public works then in progress, both of architecture and statuary; and well did the event sanction his choice. The buildings reared under the direction of this great sculptor, though finished within a short period, seemed built for ages; and, as observed by Plutarch, had the venerable air of antiquity when newly completed, and retained all the freshness of youth after they had stood for ages. Of these works the most celebrated was the temple of Minerva (the guardian deity of Athens), which was built in the Acropolis. This edifice had been previously called the Hecatompedon, from the circumstance of its having measured a hundred feet square; but after it was re-built it was called the Parthenon.

Plutarch, after stating that Phidias was appointed general superintendent of all the public works, informs us that the temple of the Parthenon was rebuilt by Callicrates and Ictinus. He further states, that the long wall of the city, which Socrates says he heard Pericles propose to the people, was built by the former of these architects. It has hence been inferred by some that Phidias had no personal or immediate concern in any parts of the workmanship, and that he is excluded from a share in the work of sculpture by the express language of Plutarch. This inference, however, seems scarcely warranted by the text, and is contrary to other evidence. It is true that the professions of statuary and architect were frequently united in Greece, especially in the earlier times; but it is exceedingly singular that, had this been the case with Callicrates and Ictinus, and especially had they been the authors of works so exquisite as those which adorned the Parthenon, their names should never have been mentioned by Pliny among the celebrated sculptors of the age of Phidias. Ictinus seems to have attained a higher eminence in his art than Callicrates, and was employed in constructing the temple of Phygalia while his contemporary builder was engaged in raising the wall of Athens, a work necessarily of much more massiveness than taste. The marbles of the Phygalian temple have been regarded by the most competent judges

as inferior to the metopes of the Parthenon now deposited in the British Museum, and are probably executed by a different hand. But there is no evidence that Ictinus framed even these; and, therefore, no inference can hence be drawn in favour of the hypothesis that he completed those which adorned the temple of Minerva. It cannot, however, for a moment be supposed that all the ornaments of the latter edifice were entirely the workmanship of Phidias. It is most probable that he formed the designs for the whole; that Callicrates and Ictinus carried into effect the architectural part of them; and that Alcamenes, and others his pupils and contemporaries, executed the larger part of the sculpture, while he occasionally touched and finished the more important figures, and overlooked the process by which his noble conceptions were embodied and rendered immortal.

All writers agree in regarding the statue of Minerva, which was erected within the temple, as the entire production of Phidias. It was indeed the most celebrated of all his works, if we except the Olympian Jupiter at Elis. Independently of the workmanship, it was of noble dimensions and of the most costly materials. It was twenty-six cubits or thirty-nine feet in height, and formed of ivory and gold, being most probably composed originally of the former, and overlaid, at least in parts, by the latter.

Phidias was very ungratefully treated by his countrymen, who accused him of defrauding them of the gold they provided for his statue of Minerva. But Pericles, having foreseen the danger to which his superiority would expose him, had advised him so to employ the gold that it might readily be separated from its place; and on its being taken down and weighed, it was found perfectly entire. This, however, was not the only charge with which Phidias had to contend. According to Plutarch, he had engraven his name on the statue in the Parthenon; but Cicero informs us that, not being permitted to inscribe his name upon its base, he introduced his own figure among the decorations of the shield. It appears, indeed, from Plutarch's life of Pericles, that he carved his own figure and that of his munificent patron on the shield, representing the former as an old man, bald-headed, lifting a stone with both his hands, and the latter fighting with an Amazon, and so raising his arm to throw a javelin that part of his face was hidden. This circumstance was brought forward as a serious accusation against him; and, according to Plutarch, he was in consequence thrown into prison, where he died, as some supposed, a natural death; but, as others conceived, by poison. At least the latter hypothesis was supported by those who wished to throw odium on Pericles, by causing it to be suspected that this event was accomplished by his connivance. The whole story, however, appears from the greater number of authorities to be founded in mistake; and from these it seems that the artist withdrew in disgust to Elis, where he framed the Olympian Jupiter. Menon, his base accuser, was exempted from taxes by a public decree, and the generals of the republic ordered to afford him their especial protection. The conduct of the Athenians on this occasion, although it admits of no excuse, may be explained in some degree on the supposition that their envy of surpassing genius and success was heightened by their disposition to extend to Phidias part of that odium which at one period fell on Pericles. In-

deed the artist had been previously accused of suffering his house to be made the scene of the debaucheries of his patron; though, for the honour of genius, it is to be hoped that the charge was destitute of foundation.

Animated rather than subdued by the ingratitude of his countrymen, Phidias laboured to surpass the greatest works with which he had adorned Athens. With this view he framed the statue of Jupiter Olympius for the Eleans, and completely succeeded even in excelling his own Minerva in the Parthenon. Lucian informs us that in order to render this work as perfect in detail as it was noble in conception and outline, he exposed it while in progress to the public view, and, concealing himself near it, heard every criticism made by the spectators, and profited by every suggestion which he considered as useful. This statue was sixty feet in height, and is represented, in the enthusiastic descriptions of those who saw it, as embodying the sublime picture which Homer has given of the monarch of the heavens.

PHILEMON OF ATHENS, a Greek poet, contemporary with Menander, to whom only he was considered as second in dramatic composition. A few fragments of his writings have come down to us, which were originally collected by Hugo Grotius, although English translations have appeared. The time of his birth has been assigned to 373 B. C.; and he is said to have died through excessive laughter at seeing an ass eat figs from a countryman's basket, B. C. 274.

PHILIDOR, ANDREW, a musician of Dreux, of some reputation in his profession, but far more celebrated as the best chess-player of his age. He was born in France in 1726, and became a page in the band of the king, where he made so great a proficiency that he composed a successful motet with full choruses before his twelfth year. As he grew up his fondness for the game of chess increased into a passion, in order to indulge which he travelled over great part of Europe, engaging every where with the best players. He continued in this country some time, during which he printed his "Analysis of Chess," a book which has since gone through numerous editions, and is considered a standard work. On his return to France he devoted his attention to the comic opera, of which, with Monsigny and Duni, he may be considered the reviver. There are twenty-one operatic pieces of his composition, of which "Le Maréchal," produced in 1761, ran more than a hundred nights. Philidor afterwards returned to England, and in 1779 set the "Carmen Seculare," esteemed the best of his works. His death took place in 1795. A short time previously to his decease he played two games of chess at the same time, blind-fold, against two of the most distinguished amateurs, one of which he won, the other was a drawn game.

PHILIP, king of Macedon.—This monarch, who was the father of Alexander the Great, flourished in the middle of the fourth century before the Christian era. He went to Thebes as a hostage when he was very young, and received an excellent education in the house of the celebrated Epaminondas. At the age of twenty-two, B. C. 361, he ascended the throne of Macedonia, which he found tottering and surrounded by numerous enemies. His genius soon succeeded in establishing it, and raising it to a pitch of greatness which it had never before attained. He freed himself from his enemies, partly by concessions, and

partly by force of arms. In a short time he made war also upon his peaceful neighbours; and, encouraged by his successes in Thessaly and Thrace, he sought gradually to extend his dominions over all Greece. The dissensions of the different states favoured his designs, and the subtle Philip well knew what use to make of this division. When, therefore, he was summoned to aid the Thebans against the Phocians, who had plundered the treasury of the temple at Delphi, he did not neglect this opportunity to carry into effect his ambitious purposes. The subjugation of the Phocians was very soon accomplished, but the treacherous conduct of Philip towards his allies opened the eyes of the Greeks; several states formed a league with the Athenians to oppose him, while others condescended to use the most disgraceful flattery towards the artful conqueror. A wound which he received on his return from a campaign against the Scythians, delayed the blow which was to prostrate the liberty of Greece, till at last the great victory at Cheronæa, B. C. 338, decided its fate. Philip assembled at Corinth the deputies of all the Grecian states, and dictated the terms of peace, which deprived them of freedom. When he was on the point of causing himself to be chosen commander-in-chief of the army which was to march against the Persians, he was assassinated, in the forty-seventh year of his age, by Pausanias, a young Macedonian, who was hired to commit this act by the Persians. This prince, the inventor of the Macedonian phalanx, united, with the highest talents of a commander, the intrepidity of the bravest soldier; but ambition and love of power were the most prominent features in his character, which often led him to the most unwarrantable actions.

PHILIP II., king of Spain, was the son of the emperor Charles V. and of Eleonora of Portugal. He was called by the Spanish writers the Prudent, and by the protestants the Demon of the South, and was born at Valladolid in 1527. Naturally cold, grave, and reserved, but sagacious and active, he was educated with care by Spanish ecclesiastics, by whom he was early imbued with bigoted sentiments. At the age of sixteen years he married the Portuguese princess Mary, and was entrusted by his father with the administration of Spain, under the direction, however, of the duke of Alba. In 1547 Charles sent for him to come to Brussels, and Philip was received with every demonstration of joy by the Netherlandish estates; but his austerity and his preference of his Spanish courtiers soon rendered him an object of dislike. His father was desirous of having him declared his successor to the imperial throne by the diet assembled at Ratisbon in 1550, but his cold and proud manners were so unfavourable to his cause that he was sent back to Spain. Having lost his first wife, Philip soon after married Mary I. of England, who was much older than himself; but his unpopularity among the English rendered his residence here so disagreeable that he soon left the country and retired to Flanders. In 1555 Charles V. abdicated his crown in favour of his son, who thus became the first sovereign of Europe. Veteran troops, able generals and statesmen, a yearly revenue of 30,000,000 ducats, rich colonies, and industrious provinces had raised Spain to an unexampled degree of power. Philip received from his father, in the presence of the states-general, and with the most impressive solemnities, the sovereignty of the Low

Countries, and a few weeks afterwards assumed that of Spain. Charles retired to a monastery, on a moderate allowance, which, through the neglect of his son, was irregularly transmitted to him. In 1556 Philip concluded a truce with France, which was broken by the French, at the instigation of Pope Paul IV., the same year. Paul having declared that Philip had forfeited the kingdom of Naples, a fief of the holy see, the latter found himself obliged to send the duke of Alba against the head of the church, who was forced to accede to an armistice. Philip then came to England, and prevailed on Mary, by the threat that he would otherwise never again set foot in her dominions, to declare war against France. A considerable English force accordingly joined the army under Philibert, duke of Savoy, and the count of Egmont, which was besieging St. Quintin. The French, under Montmorency, were entirely defeated on the 10th of August, 1557. Philip, who during the battle was occupied in prayer, joined the army after it was over.

Instead of taking advantage of this victory to march to Paris, Philip was satisfied with occupying St. Quentin, Ham, and Chatlet, and soon after, under the impulse of superstitious fears, concluded a disadvantageous peace with the pope. On the death of Mary, which was hastened by the neglect of her husband and the loss of Calais, Philip sued for the hand of Elizabeth, who was too well acquainted with his temper and the aversion of her subjects against him to listen to his addresses. The peace of Cambray finally terminated the long struggle of the French and Spanish monarchies, under conditions favourable to the latter. The marriage of Philip with the daughter of Henry II., king of France, who had been previously designed for Don Charles, son of Philip, was stipulated by one of the articles of this peace. In the course of the year Philip returned to Spain, leaving the government of the Low Countries in the hands of his natural sister, Margaret, duchess of Parma. His arrival was celebrated by the inquisition with an *auto da fé*, and his reverential conduct during the burning of his subjects is highly praised by the Spanish writers. Soon after this the troubles in the Low Countries broke out. Philip established the inquisition there for the suppression of heresy, and refused to mitigate its rigours, declaring that it was better to be without subjects than to be the ruler of heretics. The blood-thirsty Alba was sent to execute the cruel policy of the Spanish court. The counts of Egmont and Hoorn, with a great number of less distinguished sufferers, perished on the scaffold. Philip remained a cold and unmoved spectator of the horrors caused by his own rigorous policy. At the same period a tragic event in his own family tended to strengthen the gloom of his character. His son, Don Carlos, died in prison, where he had been thrown on a charge of treason, and two months after died Elizabeth, the beautiful and virtuous wife of Philip.

An insurrection of the Moors in Granada was quelled in 1570, and Philip married the archduchess Anne of Austria, his fourth wife. In the following year his fleet assisted at the battle of Lepanto, gained by Don John of Austria over the Turks. The duke of Alba was recalled from the Netherlands in 1573. His successor, Requesens, died in 1576, and was followed by Don John of Austria, who was empowered to make some concessions; but, soon after

his death, the union of Utrecht was formed. The Belgic Netherlands, however, were reduced by the prince Alexander Farnese, who next commanded the Spanish forces in that quarter. The throne of Portugal, having become vacant by the death of Sebastian, was claimed by Philip, who sent the duke of Alva to take possession of that kingdom. Philip himself soon followed him thither, and received the homage of the Portuguese estates. The assassination of William prince of Orange in 1584 was received with the most indecent expressions of joy at the Spanish court, but William's son, Maurice, was a still more formidable enemy. A rupture with England soon followed, and the Armada was fitted out for the conquest of this kingdom. When the duke of Medina Sidonia, who had the command of the expedition, appeared before Philip with the information of its destruction, the king thanked him, because he had not despaired of his country. "The will of God be done," he added, coldly; "I sent my ships to fight with the English, not with the elements."

This event was a death-blow to the Spanish monarchy. Philip sent assistance to the leaguers in France, and commanded the duke of Parma to invade the kingdom; and even after Henry IV.'s conversion to the catholic faith, he continued his hostility to that prince, who, in consequence, declared war against him. The war with England was meanwhile continued, and Spain not only suffered much by losses in her American colonies, but was compelled to witness the capture of Cadiz, and the destruction of the shipping in that port by Howard and the earl of Essex. Prince Maurice of Nassau had also gained the ascendancy in the Low Countries, and seven of the provinces had declared themselves independent. Reverses and diseases at length broke Philip's spirit; he became desirous of restoring tranquillity to his dominions, and concluded the treaty of Vervins with France. He died the following year, 1598. The gout, dropsy, and a violent fever, had afflicted him the two last years of his life; but he retained his senses and his activity to the last. Sores on his breast and knees, the consequence of his early debaucheries, disturbed his last days, and it is said that from their corrupt matter issued swarms of vermin, which the physicians were unable to prevent. Philip was a prince of considerable capacity, and he entered with facility into the details of affairs. His pomp, generosity, activity, and just administration, when it did not interfere with his own private plans, made a strong impression on the minds of men; but his boundless ambition, his severity, and his gloomy superstition, made his reign a period of war and of bad passions, and exhausted the immense resources of his empire.

PHILIP II., AUGUSTUS, king of France, was born in 1165, and ascended the throne on the death of his father, Louis VII., in 1180. One of his first measures was the banishment of the Jews from the kingdom, and the confiscation of their property. This was done under pretence of their being guilty of various crimes; but the real purpose of the measure was to get possession of their wealth. Philip next endeavoured to repress the tyranny and rapacity of the nobles, which he effected partly by art and partly by force. In 1190 he embarked at Genoa on a crusade to the Holy Land, where he met Richard Cœur-de-Lion, who was engaged in the same cause in Sicily. The jealousies and disputes which divided

the two kings induced Philip to return home the next year; and he took advantage of Richard's imprisonment in Austria to seize some of the English fiefs in Normandy. This enterprise was in direct violation of the oath by which the two princes had mutually bound themselves to attempt nothing against each other's dominions during the continuance of the crusade; and on Richard's delivery he commenced a war against Philip, which continued till the death of the former in 1199. Philip, on his return from the Holy Land, had married Ingelburga, sister of the king of Denmark; but, having taken some disgust at her, he finally procured from his bishops a divorce, under pretence of consanguinity, and married Agnes, daughter of the duke of Méran. On the complaint of the king of Denmark the pope declared his marriage null; and, on Philip's refusing to receive Ingelburga, pronounced the interdict against France. The king was therefore obliged to yield, and restore her the honours of a wife and queen. In his subsequent wars with John, Philip conquered all Normandy, Touraine, Anjou, and Maine, so that of all the English possessions in France Guienne alone remained. Philip also took part in the crusade against the Albigenses, and died in 1223, after a reign of forty-three years. This prince was an able general and sovereign; he extended the boundaries of the kingdom, and first raised the royal authority from its dependence on the great vassals. He improved the military organization of his realm, founded useful institutions, constructed roads, and favoured learning.

PHILLIPS, AMBROSE, a poet and dramatic writer, who was born in Leicestershire, and studied at Cambridge. On quitting the university he came to London, and became one of the literary wits who frequented Button's coffee-house, and a friend of Steele and Addison. The publication of his "Pastorals" involved him in a war with Pope, who ridiculed them in "The Guardian;" in consequence of which Phillips threatened to inflict personal correction on the satirist. He was one of the writers of a periodical paper called "The Freethinker;" and Dr. Boulton, the conductor, obtaining preferment in Ireland, Phillips was made registrar of the prerogative court at Dublin. He returned to England in 1748, and died the next year. He was the author of "The Distressed Mother," a tragedy taken from Racine, "The Briton," and "Humphrey, Duke of Gloucester;" and he wrote "The Life of Archbishop Williams."

PHILLIPS, JOHN, an English poet, born in Oxfordshire, 1676, and educated at Christ Church, Oxford, where he produced "The Splendid Shilling," in which the sonorous cadence of the blank verse of Milton is adapted to familiar and ludicrous topics. He also wrote "Blenheim," a poem, in celebration of the duke of Marlborough's victory; but his principal work is "Cyder," a Georgical work, in imitation of Virgil. He died in 1708.

PHILLIPOT, THOMAS, a learned English antiquary, who was educated at Clare college, Cambridge. He was the author of "Villare Cantianum, or Kent Surveyed and Illustrated." His death took place in 1682.

PHILLIPS, EDWARD, and JOHN, two English authors, who were the nephews of Milton the poet. They were the sons of Edward Phillips by Anne Milton, the sister of the poet, and were born in London in 1630 and 1631. Their lives are not only

interesting as a fragment of the history of Milton, but curious as a specimen of the condition of professed authors in the seventeenth century. If they had been either men of genius or contemptible scribblers, they would not in either case have been fair specimens of their class. The nephews of Milton belonged to that large body of literary men who are destined to minister to the general curiosity; to keep up the stock of public information; to compile, to abridge, to translate;—a body of importance in a great country—being necessary to maintain, though they cannot advance, its literature. The degree of good sense, good taste, and sound opinions diffused among this class of writers is of no small moment to the public reason and morals. To the mother of these young men the first original English verses of Milton were addressed, which he composed before the age of seventeen, to soothe her sorrow for the loss of an infant son. His first published verses are the "Epitaph on Shakspeare." To perform the offices of domestic tenderness, and to render due honour to kindred genius, were the noble purposes by which he consecrated his poetical power at the opening of a life of which every moment corresponded to this early promise. On his return from his travels, he found his nephews, by the death of their father, become orphans. He took them into his house; he supported and educated them, which he was enabled to do by the recompence which he received for the instruction of other pupils.

John, the second of Milton's nephews, published very early a vindication of his uncle's defence of the people of England. But both, in a very few years weary of the austere morals of the republicans, quitted the party of Milton, and adopted the politics, with the wit and festivity of the young cavaliers. But the elder, a person of gentle disposition and amiable manners, more a man of letters than a politician, retained due reverence and gratitude for his benefactor, and is believed to have used his influence in saving his uncle at the restoration. Twenty years after the death of Milton, the first life of him was published by Edward Phillips, upon which all succeeding narratives have been built. His "*Theatrum Poetarum*" will be always read with interest, as containing the opinions concerning poetry and poets which he probably imbibed from Milton. This amiable writer died between 1694 and 1698.

John Phillips was, throughout life, chiefly a political pamphleteer. He adhered to the cause of Charles II. till it became unpopular, and disgraced the name of Whig by adopting that denomination, then new, of the Friends of Liberty, when he associated with the atrocious Titus Oates; and in his vindication of that execrable wretch he adopted the following maxim, "that the attestations of a hundred catholics cannot be put in balance with the oath of one protestant," which, if our own party were substituted for protestant, and the opposite party for catholic, might be regarded as the general principle of the jurisprudence of most triumphant factions. He was silenced by the fatal events of 1683, which seemed to be the final triumph of the court over public liberty. In 1695 he wrote a poem on the death of Queen Mary; and in 1697 he celebrated King William as Augustus Britannicus, in a poem on the peace of Ryswick. From the revolution to his death, which took place about 1704, he was usefully employed as editor of "*The Monthly Mercury*," a journal which was

wholly, or principally, a translation from "*Le Mercure Historique*," published at the Hague by some protestant refugees, whose writings contributed to excite Europe against Louis XIV.

PHILLIPS, THOMAS, a catholic writer, who was born at Ickford in Buckinghamshire, and was educated at St. Omer's. He was the author of a "*Life of Cardinal Pole*;" "*The Study of Sacred Literature Stated and Considered*;" and he also translated, in verse, "*Lauda Sion Salvatorem*," and "*Censura Commentariorum Cornelii a Lapide*." He died in 1774.

PHILLIPS, WILLIAM, a clever English writer, who was a member of the society of Friends. Among his most popular works we may enumerate his "*Outline of Mineralogy and Geology*," which was followed by "*An Elementary Introduction to the Knowledge of Mineralogy*." He was also the author of several papers published in the Transactions of the geological society, all of them containing proofs of the zeal and effect with which he pursued his enquiries. It was after the invention of Dr. Wollaston's reflecting goniometer that his assiduity and success in the use of that beautiful instrument enabled him to produce his most valuable "*Crystallographic Memoirs*;" and the third edition of his elaborate work on mineralogy contains perhaps the most remarkable results ever yet produced on crystallography, from the application of goniometric measurement, without the aid of mathematics. In the fifth volume of the Transactions Mr. Phillips compared some of the strata near Dover with those of the opposite coast of France; and proved that the cliffs on the two sides of the English Channel, though evidently portions of strata once continuous, must always have been separated by a considerable space. But the service for which he principally claims the gratitude of English geologists is his having been the proposer of "*The Geological Outlines of England and Wales*;" in which his name is joined to that of the Rev. William D. Conybeare. Mr. Phillips died, much regretted, early in 1829. His brother, Mr. Richard Phillips, is deservedly celebrated as a lecturer on chemistry.

PHILO, a learned Jewish author, who flourished in the first century of the Christian era, in the reign of the emperor Caligula. He was born, some years before Christ, in Alexandria, where he was educated, and distinguished himself by his proficiency in eloquence, philosophy, and a knowledge of the sacred writings. With the writings of Plato, whose philosophy was at that time in the highest repute in Alexandria, he made himself intimately acquainted, and he adopted his doctrines so completely that it was said of him, *Philo platonizes*. From the time of the Ptolemies the Jews had borrowed the use of allegories from their Egyptian neighbours, and thus imbibed Platonic and Pythagorean doctrines, which they treated as the hidden and symbolical sense of their own law. Thus, without having the appearance of being indebted to the heathen philosophers, they could make an arbitrary use of their systems. These systems were likewise mixed with various oriental theories, in particular respecting the nature of God.

Philo zealously studied this philosophy, then so popular in Alexandria; and either because he did not sufficiently understand the Jewish doctrines, or because he was not satisfied with the literal sense of the Mosaic law, he mingled Platonic dogmas with the Holy Scriptures, and ascribed them to Moses. Pro-

bably he followed the example of the Essenes and Therapeutæ, of whom he always spoke with great esteem, though he did not adopt their mode of life. He considered God and matter as co-eternal principles; God as the primitive light, from whose rays all finite intelligences proceed. The understanding or wisdom of God he called also the Son of God, his image, according to which God, by his creative power, produced the material world. He founds our knowledge of God upon intuition. On account of these doctrines, Bouterwek considers him as one of the first Alexandrian New Platonists. Philo perfected himself also in eloquence, and acquired a knowledge of public affairs, in which his fame was so great that he was sent by his countrymen, in the year 42, at the head of an embassy to Rome, to defend the Jews against the calumnious accusations of Apion and others. Caligula would not admit the embassy into his presence and Philo was even in danger of losing his life. He composed, in consequence, a written justification of the Jews, evincing great learning and skill. The accounts are unworthy of belief, which state that Philo went afterwards to Rome under Claudius, that he became there the friend of the apostle Peter, and embraced the Christian faith, but renounced it again on account of some mortifications which he met with. Those writings of Philo which have come down to us show that he was a man of great learning and industry, who was well acquainted with Greek philosophy and literature, and are very useful for those who would learn the state of philosophy at that time in Alexandria.

**PHILO OF BIBLOS**, a grammarian, who lived under Nero and the following emperors, till the time of Adrian. He translated "Sanchoniathon's Phœnician History into Greek," of which we still possess some fragments.

**PHILO OF BYZANTIUM**, who lived in the second and third centuries, is mentioned as the author of a work on military engines, on the seven wonders of the world, &c. Besides this writer there were an academic and a stoic philosopher of this name.

**PHOCION**, an Athenian general, who is considered one of the most virtuous characters of antiquity. Though of humble descent, he received a good education, and imbibed, under Plato and other philosophers, those elevated sentiments which governed his whole life. His external appearance was stern and severe, but his disposition was mild and gentle. His eloquence was distinguished for clearness and brevity; and his opinion was pronounced in the assemblies of the people freely and without hesitation. He first served under Chabrias, an officer of merit, but of a violent and unequal character. He gained his esteem and moderated his impetuosity. His activity contributed essentially to the naval victory of Naxos, 377 B. C., and he afterwards collected, with great prudence, the taxes of the islands. In the war with Philip of Macedon, the Athenians sent Phocion with some troops to Eubœa, in hopes to induce the inhabitants to form a junction with him. The gold of Philip rendered this project abortive, and Phocion was obliged to retire with his troops to an eminence for security. The enemy surrounded him and made preparations for attack. Reduced to despair, Phocion made an onset, and gained a complete victory. Before the battle he gave permission to all who desired it to retire; and after the battle he liberated the prisoners, to save them from the fury of the Athenians.
